ENCYCLOPÆDIA BRITANNICA.

ROTHE

ROTHE, RICHARD (1799–1867), theologian, was born at Posen, January 28, 1799, of parents in a good position. After passing through the grammar schools of Stettin and Breslau, he studied theology in the universities of Heidelberg and Berlin (1817–20) under Daub, Schleiermacher, and Neander, the philosophers and historians Hegel, Creuzer, and Schlosser, exercising a considerable influence in shaping his thought. From 1820 to 1822 he was in the clerical seminary at Wittenberg, and spent the next year in private study under his father's roof at Breslau. In the autumn of 1823 he was appointed chaplain to the Prussian embassy in Rome, of which Baron Bunsen was the head. This post he exchanged in 1828 for a professorship in the Wittenberg seminary, and hence in 1837 he removed to Heidelberg as professor and director of a new clerical seminary; in 1849 he accepted an invitation to Bonn as professor and university preacher, but in 1854 he returned to Heidelberg as professor of theology and member of the Oberkirchenrath, a position he held until his death, August 20, 1867. Rothe's mental and religious development was one of continuous progress. As a youth he was the subject of deep religious feeling, with a decided bent towards a supernatural mysticism; his chosen authors were those of the romantic school, and Novalis remained his life through a special favourite. In Berlin and Wittenberg he came under the influence of Pietism as represented by such men as Stier and Tholuck, though the latter pronounced him a "very modern Christian." He afterwards himself confessed that, though he had been a sincere, he was never a happy Pietist. In Rome, where he enjoyed the intimate friendship of Bunsen, and studied church history under the broadening influence of classical and ecclesiastical art, his mind broke loose from the straitened life and narrow views of Pietism and he learned to look at Christianity in its human and universalistic aspects. From that time he began to develop and work out his great idea, the inseparable relation of religion and morals, finding in the latter the necessary sphere and the realization of the idea of the former. He began then, and particularly after the revolution of July 1830, likewise to give a more definite form to his peculiar view of the relations of church and state. In consequence of this

enlargement of his ideas of the world, religion, morals, Christianity, the church and the state, Rothe gradually found himself out of harmony with the Pietistic thought and life of Wittenberg, and his removal to Heidelberg in 1837 and the publication of his first important work (*Anfänge der christlichen Kirche*) in that year coincide with the attainment of the principal theological positions with which his name is associated. During the middle period of his career (1837–61) he led the life of a scholastic recluse, taking no active public part in ecclesiastical affairs in any way. During the last six years of his life (1861–67), partly owing to his liberation from great domestic cares and partly to the special circumstances of the church in Baden, he came forward publicly and actively as the advocate of a free theology and of the *PROTESTANTENVEREIN* (*q.v.*). This important change in Rothe's practice was preceded by the publication of a valuable series of theological essays (in the *Studien und Kritiken* for 1860), afterwards published in a separate volume (*Zur Dogmatik*, Gotha, 1st ed. 1863, 2d ed. 1869), on revelation and inspiration more particularly. These essays were a very searching examination of the relation of revelation to Scripture, and provoked much hostile criticism in quarters previously friendly to Rothe, where the relation was usually treated as almost one of identity. In consequence of this publication, and his advocacy of the programme of the *Protestantenverein*, he was classed at the end of his life amongst the more decided theological liberals rather than with the moderate orthodox party, amongst whom so many of his personal friends were to be found.

Rothe was one of the most if not the most profound and influential of modern German theologians next to Schleiermacher. Like the latter he combined with the keenest logical faculty an intensely religious spirit, while his philosophical tendencies were rather in sympathy with Hegel than Schleiermacher, and theosophic mysticism was more congenial to him than the abstractions of Spinoza, to whom Schleiermacher owed so much. He classed himself amongst the theosophists, and energetically claimed to be a convinced and happy supernaturalist in a scientific age. A peculiarity of his thought was its systematic completeness and consistency; aphoristic, unsystematic,

timidly halting speculation was to him intolerable. Though his own system may seem to contain extremely doubtful or even fantastic elements, it is allowed by all that it is in its general outlines a noble massive whole, constructed by a profound, comprehensive, fearless, and logical mind. Another peculiarity of his thought was the realistic nature of his spiritualism: his abstractions are all real existences; his spiritual entities are real and corporeal; his truth is actual being. Hence Rothe, unlike Schleiermacher, lays great stress, for instance, on the personality of God, on the reality of the worlds of good and evil spirits, and on the visible second coming of Christ. Hence his religious feeling and theological speculation demanded their realization in a kingdom of God coextensive with man's nature, terrestrial history, and human society; and thus his theological system became a *Theologische Ethik*. It is on the work published under this title that Rothe's permanent reputation as a theologian and ethical writer will rest. The first edition, in three volumes, was published in 1845-48, and remained twelve years out of print before the second (1867-71, in five volumes) appeared. It was the author's purpose to rewrite the whole, but he had completed the first two volumes only of the new edition when death overtook him. The remainder was reprinted from the first edition by Prof. Holtzmann, with the addition of some notes and emendations left by the author.

This work begins with a general sketch of the author's system of speculative theology in its two divisions, theology proper and cosmology, the latter falling into the two subdivisions of *Physik* (the world of nature) and *Ethik* (the world of spirit). It is the last subdivision with which the body of the work is occupied. After an analysis of the religious consciousness, which yields the doctrine of an absolute personal and spiritual God, Rothe proceeds to deduce from his idea of God the process and history of creative development, which is eternally proceeding and bringing forth, as its unending purpose, worlds of spirits, partially self-creative and sharing the absolute personality of the Creator. As a thorough-going evolutionist Rothe regards the natural man as the consummation of the development of physical nature, and obtains spirit as the personal attainment, with divine help, of those beings in whom the further creative process of moral development is carried on. His theory leaves the natural man, without hesitation, to be developed by the natural processes of animal evolution. The attainment of the higher stage of development is the moral and religious vocation of man; this higher stage is self-determination, the performance of every human function as a voluntary and intelligent agent, or as a person, having as its cosmical effect the subjection of all material to spiritual existences. This personal process of spiritualization is the continuation of the eternal divine work of creation. Thus the moral life and the religious life coincide, and when normal are identical; both have the same aim and are occupied with the same task, the accomplishment of the spiritualization of the world. "Piety, that it may become truth and reality, demands morality as its fulfillment, as the only concrete element in which the idea of fellowship with God is realized; morality, that it may find its perfect unfolding, requires the aid of piety, in the light of which alone it can comprehend its own idea in all its breadth and depth." Rothe follows Schleiermacher in dividing his ethical system into the three parts of the doctrine of moral ends (*Güterlehre*), or the products of moral action, the doctrine of virtue (*Tugendlehre*), or of the power producing moral good, and the doctrine of duty (*Pflichtenlehre*), or the specific form and manner in which that power obtains its results. The process of human development Rothe regards as necessarily taking an abnormal form and passing through the phase of sin. This abnormal condition necessitates a fresh creative act, that of salvation, which was, however, from the first part of the divine plan of development. As a preparation for this salvation supernatural revelation was required for the purifying and revivification of the religious consciousness, and the Saviour Himself had to appear in human history as a fresh miraculous creation, born of a woman but not begotten by a man. In consequence of His supernatural birth the Saviour, or the second Adam, was free from original sin. By His own moral and religious development He made possible a relation of perfect fellowship between God and man, which was the new and highest stage of the divine creation of mankind. This stage of development inaugurated by the Saviour is attained by means of His kingdom or the community of salvation, which is both moral and religious, and in the first instance and temporarily only religious—that is, a

church. As men reach the full development of their nature, and appropriate the perfection of the Saviour, the separation between the religious and the moral life will vanish, and the Christian state, as the highest sphere of human life representing all human functions, will displace the church. "In proportion as the Saviour Christianizes the state by means of the church must the progressive completion of the structure of the church prove the cause of its abolition." The decline of the church is therefore not to be deplored, but recognized as the consequence of the independence and completeness of the Christian life. It is the third section of his work—the *Pflichtenlehre*—which is generally most highly valued, and where his full strength as an ethical thinker is displayed, without any mixture of theosophic speculation.

Since Rothe's death several volumes of his sermons and of his lectures (on dogmatics, the history of homiletics) and a collection of brief essays and religious meditations under the title of *Stille Stunden* (Wittenberg, 1872) have been published. See F. Nippold, *Richard Rothe, ein christliches Lebensbild* (2 vols., Wittenberg, 1873-74); Schenkel, "Zur Erinnerung an Dr. R. Rothe," in the *Allgemeine kirchliche Zeitschrift*, 1867-68; Holtzmann, "Richard Rothe," in the *Jahrbuch des Protestantischen Vereins*, 1869; Schwaiz, *Zur Geschichte der neuesten Theologie* (4th ed., Leipzig, 1869, pp. 417-444); Pfeiderer, *Religionsphilosophie auf geschichtlicher Grundlage* (2d ed., Berlin, 1884, vol. I. pp. 611-615). (J. F. S.)

ROTHERHAM, a market-town and municipal borough in the West Riding of Yorkshire, is situated at the junction of the Rother with the Don navigation, on several railway lines, 5 miles north-east of Sheffield. The parish church of All Saints, occupying the site of a building dating from Anglo-Saxon times, was erected in the reign of Edward IV., and is a good specimen of Perpendicular. Among the other principal public buildings are the new market-hall, the post office, the court-house, the temperance hall, St George's Hall, the council hall, and the corporation offices. There are a large number of educational and literary institutions, including the grammar school founded in 1483, the people's charity school, the Independent college, the mechanics' institute, the free library, and the literary and scientific society. There is a large hospital, besides almshouses and various other charities. The town possesses extensive iron, steel, and brass works, potteries, glass works, breweries, saw mills, and rope yards. The population of the municipal borough (area 5995 acres) in 1881 was 34,782.

The town is of Roman origin, and was of some importance in Anglo-Saxon times. In the time of Edward the Confessor it possessed a market and a church. Mary queen of Scots stayed a night at Rotherham while a prisoner, as did also Charles I. when in the hands of the Scots. During the Civil War it sided with the Parliament. It was taken possession of by the Royalists in 1643, but after the victory of Marston Moor was yielded up to a detachment of the Parliamentary forces. The townships of Rotherham and Kimberworth were incorporated as a municipal borough in August 1871, the adjacent suburbs being included in 1879. The corporation act as the sanitary authority, and own the water-works, gasworks, and markets. They have introduced a system of main drainage, and have also provided a public park and a free library.

ROTHERSAY, a royal burgh, and the principal town of the county of Bute, Scotland, is situated in the island of Bute, at the head of a well-sheltered and spacious bay in the Firth of Clyde, 40 miles W. of Glasgow and 18 S.W. of Greenock, with which there is frequent communication by steamers. The bay affords good anchorage in any wind, and there are also a good harbour and pier. The town is the headquarters of an extensive fishing district, and is much frequented as a watering place. Besides two hydropathic establishments, it has several hotels and numerous lodging houses. Facing the bay there is an extensive esplanade. In the centre of the town are the ruins of the ancient castle, supposed by some to have been erected in 1098 by Magnus Barefoot, and by others at the same date by the Scots to defend themselves against the Norwegians. The village which grew up round the castle was made a royal burgh by Robert III., who created his eldest son David duke of Rothsay. During the Commonwealth the castle was garrisoned by Cromwell's troops. It was burned by the followers of Argyll in 1685, and remained neglected till the rubbish was cleared away by the marquis of Bute in 1816. The principal

modern buildings are the aquarium, the town-hall and county buildings, the public halls, the academy, and the Thomson institute. The corporation consists of a provost, three bailies, a dean of guild, a treasurer, and twelve councillors. The population of the royal burgh in 1871 was 8027 and in 1881 it was 8291.

ROTHSCHILD, the name of a Jewish family which has acquired an unexampled position from the magnitude of its financial transactions. The original name was Bauer, the founder of the house being **MAYER ANSELM** (1743-1812), the son of Anselm Moses Bauer, a small Jewish merchant of Frankfort-on-the-Main. His father wished him to become a rabbi, but he preferred business, and ultimately set up as a money lender at the sign of the "Red Shield" (*Rothschild*) in the Frankfort Judengasse. He had already acquired some standing as a banker when his numismatic tastes obtained for him the friendship of William, ninth landgrave and afterwards elector of Hesse-Cassel, who in 1801 made him his agent. In the following year Rothschild negotiated his first great Government loan, ten million thalers for the Danish Government. When the landgrave was compelled to flee from his capital on the entry of the French, he placed his silver and other bulky treasures in the hands of Rothschild, who, not without considerable risk, took charge of them and buried them, it is said in a corner of his garden, whence he dug them up as opportunity arose for disposing of them. This he did to such advantage as to be able afterwards to return their value to the elector at 5 per cent. interest. He died at Frankfort 19th September 1812, leaving ten children, five sons and five daughters. Branches of the business were established at Vienna, London, Paris, and Naples, each being in charge of one of the sons, the chief of the firm always residing at Frankfort, where, in accordance with the wish of the founder, all important consultations are held. By a system of cooperation and joint counsels, aided by the skilful employment of subordinate agents, they obtained unexampled opportunities of acquiring an accurate knowledge of the condition of the financial market, and practically embraced the whole of Europe within their financial network. The unity of the interests of the several members of the firm has been preserved by the system of intermarriages which has been the general practice of the descendants of the five brothers, and the house has thus grown in solidity and influence with every succeeding generation. Each of the brothers received in 1815 from Austria the privilege of hereditary landowners, and in 1822 they were created barons by the same country. The charge of the Frankfort house devolved on the eldest, **ANSELM MAYER** (1773-1855), born 12th June 1773, who was chosen a member of the royal Prussian privy council of commerce, and, in 1820, Bavarian consul and court banker. The Vienna branch was undertaken by **SOLOMON** (1774-1826), born 9th December 1774, who entered into intimate relations with Prince Metternich, which contributed in no small degree to bring about the connexion of the firm with the allied powers. The third brother, **NATHAN MAYER** (1777-1836), born 16th September 1777, has, however, generally been regarded as the financial genius of the family, and the chief originator of the transactions which have created for the house its unexampled position in the financial world. He came to Manchester about 1800 to act as a purchaser for his father of manufactured goods; but at the end of five years he removed to London, where he found full scope for his financial genius. The boldness and skill of his transactions, which caused him at first to be regarded as rash and unwise by the leading banking firms and financial merchants, latterly awakened their admiration

and envy. By the employment of carrier pigeons and of fast-sailing boats of his own for the transmission of news he was able to utilize to the best advantage his special sources of information, while no one was a greater adept in the art of promoting the rise and fall of the stocks. The colossal influence of the house dates from an operation of his in 1810. In that year Wellington made some drafts which the English Government could not meet; these were purchased by Rothschild at a liberal discount, and renewed to the Government, which finally redeemed at par. From this time the house became associated with the allied powers in the struggle against Napoleon, it being chiefly through it that they were able to negotiate loans to carry on the war. Rothschild never lost faith in the ultimate overthrow of Napoleon, his all being virtually staked on the issue of the contest. He is said to have been present at the battle of Waterloo, and to have watched the varying fortunes of the day with feverish eagerness. Being able to transmit to London private information of the allied success several hours before it reached the public, he effected an immense profit by the purchase of stock, which had been greatly depressed on account of the news of Blücher's defeat two days previously. Rothschild was the first to popularize foreign loans in Britain by fixing the rate in sterling money and making the dividends payable in London and not in foreign capitals. Latterly he became the financial agent of nearly every civilized Government, although persistently declining contracts for Spain or the American States. He did not confine himself to operations on a large scale, but on the contrary made it a principle to despise or neglect no feasible opportunity of transacting business, while at the same time his operations gradually extended to every quarter of the globe. He died 28th July 1836, and was succeeded in the management of the London house by his son **LIONEL** (1808-1879), born 22d November 1808, whose name will always be associated with the removal of the civil disabilities of the Jews. He was elected a member for the City of London in 1847, and again in 1849 and 1852, but it was not till 1858 that the joint operation of an Act of Parliament and a resolution of the House of Commons, allowing the omission from the oath of the words to which as a Jew he conscientiously objected, rendered it possible for him to take his seat. He continued to represent the city of London till 1874. **JACOB** (1792-1868), the youngest of the original brothers, was intrusted with the important mission of starting the business in Paris after the restoration of the Bourbons, for whom he negotiated large loans. At the Revolution of 1848 he was a heavy loser, and had also to be protected for a time by a special guard. It was by his capital that the earliest railroads were constructed in France; the profits he obtained from the speculation were very large. He died 15th November 1868. The Naples branch was superintended by another of the brothers, **KARL** (1780-1855). It was always the least important of the five, and after the annexation of Naples to Italy in 1860 it was discontinued.

ROTHWELL, an urban sanitary district in the West Riding of Yorkshire, situated in a pleasant valley four miles south of Leeds. It is of great antiquity, and soon after the Conquest was granted as a dependency of the castle of Pontefract to the Lacys, who erected at it a baronial residence of which there are still some remains. The church of the Holy Trinity is an old structure in

the Later English style with embattled parapet. There are a mechanics' institute and a working men's club. Coal and stone are obtained in the neighbourhood, and the town possesses match works and rope and twine factories. The population of the urban sanitary district (area 3302 acres) in 1871 was 3733, and in 1881 it was 5105.

ROTIFERA. The *Rotifera* (or *Rotatoria*) form a small, in many respects well-defined, but somewhat isolated class of the animal kingdom. They are here treated of separately, partly on account of the difficulty of placing them in one of the large phyla, partly on account of their special interest to microscopists.

Now familiarly known as "wheel animalcules" from the wheel-like motion produced by the rings of cilia which generally occur in the head region, the so-called rotatory organs, they were first discovered by Leeuwenhoek (1),¹ to whom we also owe the discovery of *Bacteria* and ciliate *Infusoria*. Leeuwenhoek described the *Rotifer vulgaris* in 1702, and he subsequently described *Melicerta ringens* and other species. A great variety of forms were described by other observers, but they were not separated as a class from the unicellular organisms (*Protozoa*) with which they usually occur until the appearance of Ehrenberg's great monograph (2), which contained a mass of detail regarding their structure. The classification there put forward by Ehrenberg is still widely adopted, but numerous observers have since added to our knowledge of the anatomy of the group (3). At the present day few groups of the animal kingdom are so well known to the microscopist, few groups present more interesting affinities to the morphologist, and few multicellular animals such a low physiological condition.

General Anatomy.—The *Rotifera* are multicellular animals of microscopic size which present a coelom. They are bilaterally symmetrical and present no true metameric segmentation. A head region is generally well marked, and most forms present a definite tail region. This tail region has been termed the "pseudopodium." It varies very much in the extent to which it is developed. It attains its highest development in forms like *Philodina*, which affect a leech-like method of progression and use it as a means of attachment. We may pass from this through a series of forms where it becomes less and less highly developed. In such forms as *Brachionus* it serves as a directive organ in swimming, while in a large number of other forms it is only represented by a pair of terminal styles or flaps. In the sessile forms it becomes a contractile pedicle with a suckorial extremity. A pseudopodium is entirely absent in *Asplanchna*, *Triarthra*, *Polyarthra*, and a few other genera. The pseudopodium, when well developed, is a very muscular organ, and it may contain a pair of glands (fig. 2, A, *gl*) which secrete an adhesive material.

The surface of the body is covered by a firm homogeneous structureless cuticle. This cuticle may become hardened by a further development of chitin, but no calcareous deposits ever take place in it. The cuticle remains softest in those forms which live in tubes. Among the free-living forms the degree of hardening varies considerably. In some cases contraction of the body merely throws the cuticle into wrinkles (*Notommata*, *Asplanchna*); in others definite ring-like joints are produced which telescope into one another during contraction; while in others again it becomes quite firm and rigid and resembles the carapace of one of the *Entomostraca*; it is then termed a "lorica." The lorica may be prolonged at various points into spines, which may attain a considerable length. The surface may be variously modified, being in some cases smooth, in others

marked, dotted, ridged, or sculptured in various ways (fig. 1, K). The curved spines of *Philodina aculeata* (fig. 1, G) and the long rigid spines of *Triarthra* are further developments in this direction. The so-called setæ of *Polyarthra* on the other hand are more complex in nature, and are moved by muscles, and thus approach the "limbs" of *Pedalion*.

FIG. 1.—A, *Floscularia companulata*, an adult male, drawn from a dead specimen (after Hudson): *t*, testis; *oc*, eye-spots. B, *Floscularia appendiculata*, an adult female (after Gegenbaur): *a*, the ciliated flexible proboscis. C, *Stephanoceros eichhornii*: *a*, the urceolus. D, *Microcodon clavus*, ventral view (after Grenacher): *m*, mouth; *a*, bristles; *x*, architroch; *s*, lateral sense-organs. E, *Polyarthra platyptera*: *oc*, eye-spot; *x*, isolated tufts representing a cephalotroch; *x*, branchiotroch; *a*, *b*, and *c*, three pairs of appendages which are moved by the muscles *m*. F, another figure of *Polyarthra*, to show the position which the appendages may take up. G, *Philodina aculeata*: *oc*, eye-spot; *s*, calcar. H, *Actinurus neptunius*. *oc*, eye-spot; *s*, calcar. I, *Asplanchna sieboldii*, male, viewed from the abdominal surface: *a*, anterior short arms; *b*, posterior longer arms; *m*, mouth; *x*, cephalotrochic tufts; *x*, branchiotroch. J, *Asplanchna sieboldii*, female; letters as before. K, *Notus quadricornis*, to show the extent to which the lorica may become sculptured. (All, except where otherwise stated, from Pritchard.)

Several genera present an external casing or sheath or tube which is termed an "urceolus." In *Floscularia* and *Stephanoceros* the urceolus is gelatinous and perfectly hyaline; in *Conochilus* numerous individuals live in such a hyaline urceolus arranged in a radiating manner. The urceolus, which is secreted by the animal itself, may become covered with foreign particles, and in one species, the well-known *Melicerta ringens*, the animal builds up its urceolus with pellets which it manufactures from foreign

¹ These numbers refer to the bibliography at p. 8.

particles, and deposits in a regular oblique or spiral series, and which are cemented together by a special secretion. The urceolus serves as a defence, as the animal can by contracting its stalk withdraw itself entirely within the tube.

Locomotor Organs.—While, as mentioned above, several genera or individual species present long spines, these become movable, and may be spoken of as appendages, in two genera only. In *Polyarthra* (fig. 1, E, F) there are four groups of processes or plumes placed at the sides of

FIG. 2.—*Floucardia appendiculata*. A and B represent the same animal, some of the organs being shown in one figure and some in the other. oc, eye-spots; g, nerve ganglion; p, pharynx (the mouth should be shown opening opposite the letter); ma, the mastax; e, oesophagus; st, stomach; a, anus, opening the cloaca; gl, mucous glands in the pseudopodium; n, nephridia; f, flame-cells; bl, contractile vesicle; m, muscles.

the body, each of which groups can be separately moved up and down by means of muscular fibres attached to their bases, which project into the body. The processes themselves are unjointed and rigid. In *Pedalion* (fig. 3), a remarkable form discovered by Dr C. J. Hudson in 1871 (12, 13, 14, and 15), and found in numbers several times since, these appendages have acquired a new and quite special development. They are six in number. The largest is placed ventrally at some distance below the mouth. Its free extremity is a plumose fan-like expansion (fig. 3, A, a, and H). It is (in common with the others) a hollow process into which run two pairs of broad, coarsely transversely striated muscles. Each pair has a single insertion on the inner wall—the one pair near the free extremity of the limb, the other near its attachment; the bands run up, one of each pair on each side and run right round the body forming an incomplete muscular girdle, the ends approximating in the median dorsal line. Below this point springs the large median dorsal limb, which terminates in groups of long setae. It presents a single pair of muscles attached along its inner wall which run up and form a muscular girdle round the body in its posterior third. On each side is attached a superior dorso-lateral and an inferior ventro-lateral appendage, each with a fan-like plumose termination consisting of compound hairs, found elsewhere only among the *Crustacea*; each of these

is moved by muscles running upwards towards the neck and arising immediately under the trochal disk, the inferior ventro-lateral pair also presenting muscles which form a girdle in the hind region of the body. Various other muscles are present: there are two complete girdles in the neck region immediately behind the mouth; there are also muscles which move the hinder region of the body. In addition to these the body presents various processes which are perhaps some of them unrepresented in other Rotifers. In the median dorsal line immediately below the trochal disk there is a short conical process presenting a pair of muscles which render it capable of slight movement. From a recess at the extremity of this process spring a group of long setose hairs the bases of which are connected with a filament probably nervous in nature. This doubtless represents a structure found in many Rotifers, and variously known as the "calcar," "siphon," "tentaculum," or "antenna." This calcar is double in *Tubicolaria* and *Melicerata*. It is very well developed in the genera *Rotifer*, *Philodina*, and others, and is, when so developed, slightly retractile. It appears to be represented in many forms by a pit or depression set with hairs. The calcar has been considered both as an intromittent organ and a respiratory tube for the admission of water. It is now, however, universally considered to be sensory in nature. Various forms present processes in other parts

FIG. 3.—*Pedalion mitra*. A, Lateral surface view of an adult female: a, median ventral appendage; b, median dorsal appendage; c, inferior ventro-lateral appendage; d, superior dorso-lateral appendage; f, dorsal sense-organ (calcar); g, "chin"; x', cephalotroch. B, lateral view, showing the viscera: oc, eye-spots; n, nephridia; e, ciliated processes, probably serving for attachment; other letters as above. C, ventral view: x', cephalotroch; x, branchiotroch; other letters as above. D, ventral view, showing the musculature (cf. text). E, dorsal view of a male: a, lateral appendages; b, dorsal appendage. F, lateral view of a male. G, enlarged view of the sense-organ marked f. H, enlarged view of the median ventral appendage. (All after Hudson.)

of the body which have doubtless a similar function, e.g., *Microcodon* (fig. 1, D, s) with its pair of lateral organs. *Pedalion* presents a pair of ciliated processes in the posterior region of the body (fig. 3, B, c, and D, e), which it can apparently use as a means of attachment; Dr Hudson states that he has seen it anchored by these and swimming round and round in a circle. They possibly re-

present the flaps found on the tail of other forms. *Pedalion* also has a small ciliated muscular process (fig. 3, A, *g*) placed immediately below the mouth, and termed a "chin," which appears to be merely a greater development of a sort of lower lip which occurs in many Rotifers.

Muscular System.—All the Rotifera present a muscular system which is generally very well developed. Transverse striation occurs among the fibres to a varying extent, being well marked in cases where the muscle is much used. The muscles which move the body as a whole are arranged as circular and longitudinal series, but they are arranged in special groups and do not form a complete layer of the body-wall as in the various worms. Some of the longitudinal muscles are specially developed in connexion with the tail or pedicle. Other muscles are developed in connexion with special systems of organs,—the trochal disks, the jaw apparatus, and the reproductive system. The muscles in connexion with the trochal disk serve to protrude or withdraw it, and to move it about, when extruded, in various directions. The protrusion is probably, however, generally effected by the elasticity of the integument coming into play during the relaxation of the retractor muscles, and by a general contraction of the body wall. The tentaculiferous apparatus of *Polyzoa* and *Gephyrea* is protruded in the same manner.

Trochal Disk.—This structure is the peculiar characteristic of the class. It is homologous with the ciliated bands of the larvæ of Echinoderms, Chætopods, Molluscs, &c., and with the tentaculiferous apparatus of *Polyzoa* and *Gephyrea*, and has been termed in common with these a "velum." This velum presents itself in various stages of complexity. It is found as a single circum-oral ring (*pididium*), as a single præ-oral ring (Chætopod larvæ), or as a single præ-oral ring coexisting with one or more post-oral rings (Chætopod larvæ, Holothurian larvæ). We may here assume that the ancestral condition was a single circum-oral ring associated with a terminal mouth and the absence of an anus, and that the existence of other rings posterior to this is an expression of metameric segmentation, i.e., a repetition of similar parts. With the development of a prostomiate condition a certain change necessarily takes place in the position of this band: a portion of it comes to lie longitudinally; but it may still remain a single band, as in the larva of many Echinoderms. How have the other above-mentioned conditions of the velum come about? How has the præ-oral band been developed? Two views have been held with regard to this question. According to the one view, the fact whether the single band is a præ-oral or a post-oral one depends upon the position in which the anus is about to develop. If the anus develops in such a position that mouth and anus lie on one and the same side of the band, the latter becomes præ-oral; if, however, the anus develops so that the mouth and anus lie upon opposite sides of the band, the band becomes post-oral. If we hold this view we must consider any second band, whether præ- or post-oral, to arise as a new development. The other view premises that the anus always forms so as to leave the primitive ring or "architroch" post-oral, i.e., between mouth and anus. Concurrently with the development of a prostomium this architroch somewhat changes its position and the two lateral portions come to lie longitudinally; these may be supposed to have met in the median dorsal line and to have coalesced so as to leave two rings—the one præ-oral (a "cephalotroch"), the other post-oral (a "branchiotroch"); this latter may atrophy, leaving the single præ-oral ring, or it may become further developed and thrown into more or less elaborate folds. The existing condition of the trochal disk or velum in the Rotifera seems to the writer of this article to bear out the latter view as to the way in which modifications of the velum may have come about.

In its simplest condition it forms a single circum-oral ring, as in *Microcodon* (fig. 1, D). The structures at the sides of the mouth in this form are stated to be bristles, and have therefore nothing to do with the velum (fig. 4, A, *p*). This simple ring may become thrown into folds, so forming a series of processes standing up around the mouth; this is the condition in *Stephanoceros* (fig. 4, B, *p*). There are, however, but few forms presenting this simple condition; and it must be remembered that the evidence for the assumption here made, that this is a persistent architroch and not a branchiotroch persisting where a cephalotroch has vanished, is not at present conclusive. This band, may, while remaining single and perfectly continuous, become prolonged around a lobe overhanging the mouth—a prostomium. This condition occurs in *Philodina* (fig. 4, E, F, *p*); the two sides of the post-oral ring do not meet dorsally, but are carried up and are continuous with the row of cilia lining the "wheels." There is thus one continuous ciliated band, a portion of which runs up in front of the mouth. This condition corresponds to that of the Auricularian larva. The folding of the band has become already somewhat complicated; a hypothetical intermediate condition is shown in fig. 4, C, D. The next stage in the advancing complexity is that the prostomial portion of the band (fig. 4, G, H, *p*) becomes separated as a distinct ring, a cephalotroch; we find such a stage in *Lacinularia* (fig. 4,

G, H), where both cephalotroch and branchiotroch remain fairly simple in shape. In *Meliceria* (fig. 4, I, *p*) both cephalotroch and branchiotroch are thrown into folds. Lastly, we find that in such forms as *Brachionus* the cephalotroch becomes first convoluted and

FIG. 4.—Diagrams of the Trochal Disk. A, *Microcodon*. B, *Stephanoceros*; the mouth lies in the centre of a group of tentacles. C, hypothetical intermediate form between *Microcodon* and *Philodina*, showing the development of a prostomial portion of the velum. D, dorsal view of the same. E, *Philodina*. F, dorsal view of the same. G, *Lacinularia*; the dotted line represents the portion of the velum which has become separated as a special ring—a cephalotroch. H, dorsal view of the same. I, *Meliceria*; the dotted line represents the cephalotroch; both this and the branchiotroch have become thrown into folds. J, dorsal view of the same. K, *Brachionus*; there is a large præ-oral lobe with three ciliated regions, shown by the dotted lines c, c, a discontinuous cephalotroch. L, dorsal view of the same. m, mouth; p, p', velum; p, architroch; p', portion of the architroch which becomes carried forward to line the prostomial region, but does not become separated; c, cephalotroch. (Original.)

then discontinuous (fig. 4, K, L, c), and further it may become so reduced as to be represented only by a few isolated tufts, as in *Asplanchna* (fig. 1, I, *x* and *x'*); in such a form as *Lindia* (fig. 6, c) the branchiotroch has vanished and the cephalotroch has become reduced to the two small patches at the sides of the head.

The trochal apparatus serves the Rotifera as a locomotive organ and to bring the food particles to the mouth; the cilia work so as to produce currents towards the mouth.

Digestive System.—This consists of the following regions:—(1) the oral cavity; (2) the pharynx; (3) the oesophagus; (4) the stomach; (5) the intestine, which terminates in an anus. The anus is absent in one group.

The pharynx contains the *mastax* with its teeth; these are calcareous structures, and are known as the *trophii*. In a typical

mastax (8, 9) (*Brachionus*, fig. 5, A) there are a median anvil or *incus* and two hammer-like portions, *mallei*. The incus consists of two *rami* (c) resting upon a central *fulcrum* (f); each malleus consists of a handle or *manubrium* (e) and a head or *uncus* (d), which often presents a comb-like structure. Fig. 5 shows some of the most important modifications which the apparatus may exhibit. The parts may become very slender, as in *Diglena forcipata* (fig. 5, B); the mallei may be absent, as in *Asplanchna* (fig. 5, C), the rami being highly developed into curved forceps and movable one on the other; or, the manubria being absent and the fulcrum rudimentary, the rami may become massive and subquadrate, as in *Philodina* (fig. 5, D). All the true Rotifers possess a *mastax*. Ehrenberg's group of the *Aomphina* consisted of a heterogeneous collection of forms, —*Ichthyidium* and *Chætonotus* being *Gastrotrocha*, and *Oxyphoratus*

FIG. 5.—Trophii of various forms: A, *Brachionus*; B, *Diglena forcipata*; C, *Asplanchna*; D, *Philodina*. f, fulcrum, and e, e, rami, forming the incus; c, manubrium, and d, uncus, forming the malleus. (After Hudson.)

a Polyzoan larva, while *Enteroplea* is probably a male Rotifer, and, like the other males, in a reduced condition. There is no reason for considering this mastax as the homologue of either the gastric mill of Crustaceans on the one hand or the teeth in the Chætopods' pharynx on the other; it is merely homoplastic with these structures, but has attained a specialized degree of development. Both the pharynx and the oesophagus which follows it are lined with chitin. The oesophagus varies in length and in some genera is absent (*Philodinadæ*), the stomach following immediately upon the pharynx. The stomach is generally large; its wall consists of a layer of very large ciliated cells, which often contain fat globules and yellowish-green or brown particles, and outside these a connective tissue membrane; muscular fibrillæ have also been described. Very constantly a pair of glands open into the stomach, and probably represent the hepato-pancreatic glands of other Invertebrates.

Following upon the stomach there is a longer or shorter intestine, which ends in the cloaca. The intestine is lined by ciliated cells. In forms living in an urceolus the intestine turns round and runs forward, the cloaca being placed so as to debouch over the margin of the urceolus. The cloaca is often very large; the nephridia and oviducts may open into it, and the eggs lodge there on their way outwards; they are thrown out, as are the fecal masses, by an eversion of the cloaca. *Asplanchna*, *Notommata sieboldii*, and certain species of *Ascomorpha* are said to be devoid of intestine or anus, excrementitious matters being ejected through the mouth (11).

Nephridia.—The coelom contains a fluid in which very minute corpuscles have been detected. There is no trace of a true vascular system. The nephridia (fig. 2, B, n) present a very interesting stage of development. They consist of a pair of tubules with an intracellular lumen running up the sides of the body, at times merely sinuous, at others considerably convoluted. From these are given off at irregular intervals short lateral branches, each of which terminates in a flame-cell precisely similar in structure to the flame-cells found in Planarians, Trematodes, and Cestodes; here as there the question whether they are open to the coelom or not must remain at present undecided. At the base these tubes open either into a permanent bladder which communicates with the cloaca or into a structure presenting apparently no advance in its development upon the contractile vacuole of a ciliate Infusorian.

Nervous System and Sense-Organs.—Various structures have been spoken of as nervous which are now acknowledged to have been erroneously so described (18). There is a supra-oesophageal ganglion which often attains considerable dimensions, and presents a lobed appearance (fig. 2, A and B, g). Connected with this are the eye-spots, which are seldom absent. Where these are most highly developed a lens-like structure is present, produced by a thickening of the cuticle. In the genus *Rotifer* and other forms these are placed upon the protrusible portion of the head, and so appear to have different positions at different moments. The number of eye-spots varies from one to twelve or more. They are usually red, reddish-brown, violet, or black in colour. Other structures are found which doubtless act as sense-organs. The calcar above-mentioned generally bears at its extremity stiff hairs which have been demonstrated to be in connexion with a nerve fibril. On the ventral surface of the body just below the mouth a somewhat similar structure is often developed—the chin. There are besides at times special organs, like the two lateral organs in *Microcodon* (fig. 1, D, s), which no doubt in common with the calcar and chin have a tactile function.

Reproductive Organs and Development.—The *Rotifera* were formerly considered to be hermaphrodite, but, while the ovary was always clear and distinct, there was always some difficulty about the testis, and various structures were put forward as representing that organ. One by one, however, small organisms have been discovered and described as the males of certain species of Rotifers, until at the present time degenerated males are known to occur in all the families except that of the *Philodinadæ*. The male Rotifers are provided with a single circle of cilia (a peritroch), a nerve ganglion, eye-spots, muscles, and nephridial tubules all in a somewhat reduced condition, but there is usually no trace of mouth or stomach, the main portion of the body being occupied by the testicular sac. There is an aperture corresponding with the cloaca of the female, where the testis opens into the base of an eversible penis. The males of *Floscularia* are shown in fig. 1. The male of *Pedalion mira* possesses rudimentary appendages. The ovary is usually a large gland lying beside the stomach connected with a short oviduct which opens into the cloaca. The ova often present a reddish hue (*Philodina roseola*, *Brachionus rubens*), due doubtless, like the red colour of many Crustacean ova, to the presence of tetronerythrin.

Up to the present our embryological knowledge of the group is very incomplete. Many Rotifers are known to lay winter and summer eggs of different character. The winter eggs are provided with a thick shell and probably require fertilization. Two or three of them are often carried about attached to the parent (*Brachionus*, *Notommata*), but they are usually laid and fall into the mud, there to remain till the following spring. The summer eggs are of two kinds, the so-called male and female ova, both of which are stated to develop parthenogenetically. They may be carried about in

large numbers in the cloaca or oviduct or attached to the body of the parent. The female ova give rise to female and the male ova to male individuals. Male individuals are only formed in the autumn in time to fertilize the winter ova.

Habitat and Mode of Life.—The *Rotifera* are distributed all over the earth's surface, inhabiting both fresh and salt water. The greater number of species inhabit fresh water, occurring in pools, ditches, and streams. A few species will appear in countless numbers in infusions of leaves, &c., but their appearance is generally delayed until the putrefaction is nearly over. Species of *Rotifer* and *Philodina* appear in this way. A few marine forms only have been described—*Brachionus mülleri*, *B. heptatomus*, *Synchaeta baltica*, and others.

A few forms are parasitic. *Albertia* lives in the intestine of the earthworm; a form has been described as occurring in the body-cavity of *Synapta*; a small form was also observed to constantly occur in the velar and radial canals of the freshwater jelly-fish, *Limnocolodum*. *Notommata parasitica* leads a parasitic existence within the hollow spheres of *Volvox globator*, sufficient oxygen being given off by the *Volvox* for its respiration.

Many Rotifers exhibit an extraordinary power of resisting drought. Various observers have dried certain species upon the slide, kept them dry for a certain length of time, and then watched them come to life very shortly after the addition of a drop of water. The animal draws itself together, so that the cuticle completely protects all the softer parts and prevents the animal itself from being thoroughly dried. This process is not without parallel in higher groups; e.g., many land snails will draw themselves far into the shell, and secrete a complete operculum, and can remain in this condition for an almost indefinite amount of time. The eggs are also able to withstand drying, and are probably blown about from place to place. The *Rotifera* can bear great variations of temperature without injury.

Since their removal from among the *Protozoa* various attempts have been made to associate the *Rotifera* with one or other large phylum of the animal kingdom. Huxley, insisting upon the importance of the trochal disk, put forward the view that they were "permanent Echinoderm larvæ," and formed the connecting link between the *Nemertidæ* and the Nematoid worms. Ray Lankester proposed to associate them with the *Chætopoda* and *Arthropoda* in a group *Appendiculata*, the peculiarities in the structure of *Pedalion* forming the chief reason for such a classification. There is, however, no proof that we thus express any genetic relationship. The well-developed coelom, absence of metameric segmentation, persistence of the trochal disk in varying stages of development, and the structure of the nephridia are all characters which point to the *Rotifera* as very near representatives of the common ancestors of at any rate the *Mollusca*, *Arthropoda*, and *Chætopoda*. But the high development of the mastax, the specialized character of the lorica in many forms, the movable spines of *Polyarthra*, the limbs of *Pedalion*, and the lateral appendages of *Asplanchna*, the existence of a diminutive male, the formation of two varieties of ova, all point to a specialization in the direction of one or other of the above mentioned groups. Such specialization is at most a slight one, and does not justify the definite association of the *Rotifera* in a single phylum with any of them.

Classification.—The following classification has been recently put forward by Dr C. T. Hudson (19).

CLASS ROTIFERA.

Order I.—Rhizota.

Fixed forms; foot attached, transversely wrinkled, non-retractile truncate.

Fam. 1. FLOSCULARIADÆ. *Floscularia*, *Stephanoceros*.

Fam. 2. MELICERTADÆ. *Melicerata*, *Cephalostiphon*, *Megalotrocha*, *Limnias*, *Æcistes*, *Lacinnularia*, *Conochilus*.

Order II.—Bdelloida.

Forms which swim and creep like a leech; foot retractile, jointed, telescopic, termination furcate.

Fam. 3. PHILODINADÆ. *Philodina*, *Rotifer*, *Callidina*.

Order III.—Ploima.

Forms which swim only.

Grade A. ILLORICATA.

Fam. 4. HYDATINADÆ. *Hydatina*, *Rhinops*.

Fam. 5. SYNCHETADÆ. *Synchaeta*, *Polyarthra*.

Fam. 6. NOTOMMATADÆ. *Notommata*, *Diglena*, *Furcularia*, *Scaridium*, *Pleurotrocha*, *Distemma*.

Fam. 7. TRIARTHRADÆ. *Triarthra*.

Fam. 8. ASPLANCHNADÆ. *Asplanchna*.

Grade B. LORICATA.

Fam. 9. BRACHIONIDÆ. *Brachionus*, *Notus*, *Anuraea*, *Sacculus*.

Fam. 10. PTERODINADÆ. *Pterodina*, *Pompholyx*.

Fam. 11. EUCLANIDÆ. *Euchlanis*, *Salpina*, *Diplax*, *Monostyla*, *Colurus*, *Monura*, *Metopodia*, *Stephanops*, *Monocerca*, *Mastigocerca*, *Dinocharis*.

Order IV.—Scirtopoda.

Forms which swim with their ciliary wreath, and skip by means of hollow limbs with internal locomotor muscles.

Fam. 12. PEDALIONIDÆ. *Pedalion*.

The above list includes only the principal genera. There are, however, a number of forms which could not be placed in any of the above families.

ABERRANT FORMS.

Trochospæra æquatorialis (fig. 6, c), found by Semper in the Philippine Islands, closely resembles a monotrochal polychæstous

FIG. 6.—Various aberrant forms. A, *Balatro calvus* (after Claparède): a, mastax. B, *Seison nebalis* (after Claus): m, mouth; vd, position of the aperture of the vas deferens. C, *Lindia torulosa*: a, ciliated processes at the sides of the head representing cephalotroch; oc, eye-spots. D, E, and F, *Apsilus lentiformis* (after Mecznikow): D, adult female with expanded proboscis; m, position of the mouth; s, lateral sense-organs. E, young free-swimming female. F, adult male. G, *Trochospæra æquatorialis* (after Semper): m, mouth; g, ganglion; a, anus; b, velum; oc, eye-spot; c, muscles.

larva while possessing undoubtedly Rotifer characters. Mecznikow has described a remarkable form, *Apsilus lentiformis* (fig. 6, D, E, and F), the adult female of which is entirely devoid of cilia but possesses a sort of retractile hood; the young female and the males are not thus modified. Claparède discovered fixed to the bodies of small Oligochaetes a curious non-ciliated form, *Balatro calvus* (fig. 6, A), which has a worm-like very contractile body and a well-developed mastax. As mentioned above, the ciliation is reduced to a minimum in the curious worm-like form *Lindia* (fig. 6, C). *Seison nebalis* (fig. 6, B), living on the surface of *Nebalis*, which was described originally by Grube, is the same form as the *Saccobdella nebalis*, which was supposed by Van Beneden and Hesse to be a leech. It has been shown by Claus to be merely an aberrant Rotifer.

Of the curious aquatic forms *Ichthydium*, *Chætonotus*, *Turbanella*, *Dasydites*, *Cephalidium*, *Chætura*, and *Hemidasys*, which Mecznikow and Claparède included under the name *Gastrotricha*, no further account can be given here. They are possibly allied to the Rotifera, but are devoid of mastax and trochal disk.

The following are some of the more important memoirs, &c., on the Rotifera. (1) Leeuwenhoek, *Phil. Trans.*, 1701-1704. (2) Ehrenberg, *Die Infusionsthierechen als vollkommene Organismen*, 1838. formis," *Zeit. f. w. Zool.*, 1872. (17) C. Semper, "On *Trochospæra*," *Zeit. f. w. Zool.*, xxii, 1872. (18) K. Eckstein, "Die Rotatorien der Umgegend von Giessen," *Zeit. f. w. Zool.*, 1883. (19) C. T. Hudson, "On an Attempt to reclassify Rotifers," *Quart. Jour. Micr. Sci.*, 1884. (A. G. B.)

ROTRON, JEAN DE (1609-1650), the greatest tragic poet of France before Corneille, was born on August 21, 1609 at Dreux in Normandy, and died of the plague at the same place on the 28th June 1650. His family was of small means but of not inconsiderable station, and seems to have had a kind of hereditary connexion with the magistracy of the town of Dreux. He himself was "lieutenant particulier et civil," a post not easy to translate, but apparently possessing some affinity to a Scotch sheriffship substitute. Rotrou, however, went very early to Paris, and, though three years younger than Corneille, with whom he was intimately acquainted, began play-writing before him. With few exceptions the only events recorded of his life are the successive appearances of his plays and his enrolment in the band of five poets who had the not very honourable or congenial duty of turning Richelieu's dramatic ideas into shape. Rotrou's own first piece, *L'Hypochondriaque*, appeared when he was only seventeen. His second, *La Bague de l'Oubli*, an adaptation in part from Lope de Vega, was much better, much more suggestive, and much more characteristic. It is the first of several plays in which Rotrou, following or striking out for himself a way which did not lead to much for the time but which was again entered at the Romantic revival, endeavoured to naturalize in France the romantic comedy which had flourished in Spain and England instead of the classical tragedy of Seneca and the classical comedy of Terence. Corneille, as is known to readers of his early work, had considerable leanings in the same direction, and yielded but slowly and unwillingly to the pressure of critical opinion and the public taste. Rotrou's brilliant but hasty and unequal work showed throughout marks of a stronger adhesion to the Spanish (it is needless to say that neither writer is likely to have known the English) model. *Cleagénor et Doristée*, *Diane*, *Les Occasions Perdues*, *L'Heureuse Constance*, pieces which succeeded each other very rapidly, were all in the Spanish style. Then the author changed his school, and, in 1632, imitated very closely the *Menæchmi* of Plautus and the *Hercules Cæteus* of Seneca. A crowd of comedies and tragi-comedies followed, and by the time he was twenty-eight (when documents exist showing the sale of two batches of them to the bookseller Quinet for the sum of 220 livres tournois) Rotrou had written nearly a score of plays. He was married in 1640, and had three children, a son and two daughters (none of whom, however, continued the name), and it seems that he went to live at Dreux. Previously, vague and anecdotic tradition describes him as having led rather a wild life in Paris, and especially as having been much addicted to gambling. Among his pieces written before his marriage were a translation of the *Amphitryon* under the title of *Les Deux Sosies*, which was not useless to Molière, *Antigone*, which was not useless to Racine, and *Laure Persecutée* (in the opposite style to these classical pieces), which has much merit. These were followed by others until, in 1646 and 1647, Rotrou produced his three masterpieces, *Saint Genest*, a story of Christian martyrdom containing some amusing by-play, one noble speech, and a good deal of dignified action; *Don Bertrand de Cabrière*, a comedy of merit; and *Venceslas*, which is considered in France his masterpiece, and which in a manner kept the stage till our own times. The subject (in which a father, being constrained to choose between his duty as king and his parental affection, pardons his son for a murder he has committed, but immediately abdicates as feeling himself unworthy to reign) was taken from Francisco de Rojas; the execution,

educational institutions comprise an academy of art and technical science, a naval school, an industrial school, a deaf and dumb asylum, &c. In the Groote Markt (to the south of the Hoog Straat) stands the bronze statue of Erasmus (Gerrit Gerrits), erected by his fellow-citizens in 1662; and his birth-house, now a tavern in Wijde Kerkstraat, is distinguished by a Latin inscription. The statue by Grefs of Gijsbert Karel van Hogendorp (1762–1834), a great Dutch statesman, gives his name to the Hogendorpsplein, formerly Boymansplein, behind the museum; in the "Park," which extends west along the bank of the Maas, is a marble statue by Strackée of Hendrik Tollens, the Dutch poet; and the Nieuwmarkt is adorned with a fountain in memory of the jubilee (1863) of the restoration of Dutch independence (1813). Extensive works for supplying the town with filtered water were constructed between 1870 and 1875, the water in the river and canals being rendered unwholesome by the sewerage, the treatment of which naturally presents great difficulties in a city lying in great part below high-water level. The most important industrial establishment is that of the Netherlands Steamboat Company, who are ship-owners, shipbuilders, and engineers; there are also extensive sugar-refineries and a great variety of smaller factories for the production of lead, iron, and copper wares, white lead, varnishes, tobacco and cigars, beer and vinegar, chocolate and confectionery, &c. Rotterdam is, however, not so much a manufacturing as a commercial city, and its commercial progress has been very striking since the middle of the century. While in 1846 it had only 321,764 tons out of the total of 1,024,705 tons which then represented the export trade of the Netherlands, in 1883 it had 1,940,026 tons out of a total of 3,953,009 tons. In 1850 it had only 27·9 per cent. of the outgoing vessels, and 35·77 per cent. of the tonnage; by 1870 it had 35·60 per cent. of the vessels and 50·37 of the tonnage, and by 1883 43·75 per cent. of the vessels, and 49·08 of the tonnage. Rotterdam has thus become what Amsterdam formerly was—the principal port in the country. For steamers it is now, since the opening of the new waterway through the Hoek van Holland in 1872, only two hours distant from the sea, and the channel is deep enough for vessels drawing 22 feet of water.¹ From 4471 vessels with a register tonnage of 1,688,700 tons in 1873, the shipping clearing from the Netherlands by the new waterway had increased by 1884 to 8177 vessels with register tonnage of 4,382,100 tons. Upwards of 18,000 emigrants left Europe by Rotterdam in 1881. Besides its maritime trade Rotterdam commands a most extensive river traffic, not only with the towns of the Netherlands, but with those of Belgium and Germany. With Germany alone its Rhine traffic amounted in 1883 to 1,706,587 tons, against 2,021,644 for all the other ports of the Netherlands. On January 1, 1885, Rotterdam owned 43 sailing vessels and 50 steamships with a united aggregate burden of 99,018 tons. Owing

¹ Previously the only direct way to the sea was by the Brielle (Brill) Channel, where in 1856 the fairway had gradually diminished in depth to 5 feet at low water and 11 or 12 feet at high water. In 1866 the works for the new waterway were commenced, and by November 1868 the canal from the Scheur (or northern arm of the Maas) across the Hoek had been dug. The seaward piers were completed to the originally proposed length of (together) 2800 metres, but in 1874 they were prolonged to a total of 4300 metres, thus jutting out into the sea for more than a mile. Contrary to expectations the scour was not strong enough to widen the fairway; and works for this purpose were commenced in 1877, and at a later period the width of 900 metres between the piers was reduced to 700 metres by constructing an inner pier north of the south pier. The whole work has cost upwards of 23,000,000 guilders (£1,750,000)—15½ millions expended up to 1879, and 7½ between 1881 and 1884. With the exception of a contribution of not more than 3,000,000 from the city of Rotterdam, the entire sum has been paid by the state.

to the great increase of navigation and commerce the berthing accommodation of the port frequently proves too small, though by the works at Fijenoord the length of the quays has of late years been extended by about 8000 metres. This island, two-thirds of which was purchased by the town in 1591 and the remaining third in 1658, was dyked in 1795, and became the seat of a building which has been in succession a pest-house, a military hospital, a naval college, and a private industrial school. The Netherlands Steamboat Company established its workshops there in 1825; and in 1873 the Rotterdam Trading Company began to construct the harbours and warehouses which have been purchased by the city. The population of the commune of Rotterdam, which did not much exceed 20,000 in 1632, was 53,212 in 1796, 72,294 in 1830, 88,812 in 1850, 105,858 in 1860, 132,054 in 1876, and 148,102 in 1879–80. In 1870 the city contained 111,256 inhabitants, the suburbs 3341, and the ships 2478, and in 1884 the total, exclusive of the shipping, was 169,477.

Rotterdam probably owes its origin to the castles of Wena and Bulgerstein, of which the former was laid in ruins by the Hoek party in 1426. In 1299 Count John I. granted the "good people of Rotterdam" the same rights as the burghers of Beverwijk, and freedom from toll in all his lands. In 1597 a sixth extension of the town's area took place, and a seventh followed in 1609. Francis of Braderode seized the place in 1488, but had to surrender it to the emperor Maximilian in 1489. The Spaniards were in possession from April 9th to July 31st 1572, having gained entrance partly by treachery and partly by force (see Motley, *Dutch Republic*, ii.). It was at a meeting of the states held at Rotterdam in June 1574 that the relief of Leyden was determined on, though it was not till 1580 that the town obtained a vote in the assembly.

ROUBAIX, a manufacturing town of France, the second in population in the department of Nord, lies to the north-east of Lille on the Ghent Railway and on the canal connecting the lower Deule with Scheldt by the Marq and Espierre. Several tramway lines traverse the town and connect it with various manufacturing centres in the neighbourhood. The population of Roubaix, which in 1881 was 79,700 (the commune 91,757), is almost entirely manufacturing, and the trading firms of the town gave employment besides to an equally large number of hands in the vicinity. The weaving establishments number 300 (250 for woollen or woollen and cotton goods), the leading products being fancy and figured stuffs for waistcoats, trousers, overcoats, and dresses, velvet, barége, orleans, furniture coverings, and the like. The yearly production is estimated at £6,000,000, but the annual turnover exceeds £8,000,000, if all the industries of the place are taken into account. These include 70 wool-spinning mills, 12 cotton mills, silk-works, wool-combing establishments, carpet manufactories, dye-houses, soap-works, machine-works, and foundries. Roubaix possesses several interesting churches, a library and art museum, a most interesting museum of local industries, communal schools of art and music, an industrial school for weaving, founded in 1857, a chamber of commerce dating from 1871, a chamber of arts and manufactures, a board of prud'hommes, and an agricultural and horticultural society.

The prosperity of Roubaix has its origin in the first factory franchise, granted in 1469 by Charles the Bold to Peter of Roubaix, a descendant of the royal house of Brittany; but the great development of the manufacturing industries of the town and the growth of its population date from the French Revolution. The population, which in 1804 was only 8700, had risen in 1861 to 40,274, in 1866 to 65,091, and in 1876 to 83,000.

ROUBILIAC, LOUIS FRANÇOIS (1695–1762), an able French sculptor. Born at Lyons in 1695, he became a pupil of Balthasar of Dresden and of N. Coustou. About the year 1720 he settled in London, and soon became the most popular sculptor of the time in England, quite superseding the established success of the Flemish Rysbrack.

He died on January 11, 1762, and was buried in the church of St Martin-in-the-Fields. Roubiliac was very largely employed for portrait statues and busts, and especially for sepulchral monuments in Westminster Abbey and elsewhere. His chief works in the abbey are the monuments of Handel, Admiral Warren, Marshal Wade, Mrs Nightingale, and the duke of Argyll, the last of these being the first work which established Roubiliac's fame as a sculptor. The statues of George I., Sir Isaac Newton, and the duke of Somerset at Cambridge, and of George II. in Golden Square, London, were also his work, as well as many other important pieces of portrait sculpture. Trinity College, Cambridge, possesses a series of busts of distinguished members of the college by him.

Roubiliac possessed much skill in portraiture, and was technically a real master of his art, but unhappily he lived at a time when it had reached a very low ebb. His figures are uneasy, devoid of dignity and sculptural breadth, and his draperies are treated in a manner more suited to painting than sculpture. His excessive striving after dramatic effect takes away from that repose of attitude which is so necessary for a portrait in marble. His most celebrated work, the Nightingale monument, in the north transept of Westminster Abbey, a marvel of technical skill, is only saved from being ludicrous by its ghastly hideousness. On this the dying wife is represented as sinking in the arms of her husband, who in vain strives to ward off a dart which Death is aiming at her. The lower part of the monument, on which the two portrait figures stand, is shaped like a tomb, out of the opening door of which Death, as a half-veiled skeleton, is bursting forth. Wonderful patience and anatomical realism are lavished on the marble bones of this hideous figure, and the whole of the grim conception is carried out with much skill, but in the worst possible taste. The statue of Handel in the south transept is well modelled, but the attitude is affected and the face void of any real expression. It is a striking proof of the degraded taste of the age that these painful works when first set up were enthusiastically admired.

ROUCHER, JEAN ANTOINE (1745–1794), a French poet, to whom a melancholy fate and some descriptive verse equal to anything written during at least three-quarters of a century by any of his countrymen except André Chénier, gave some reputation, was born on February 17, 1745 at Montpellier, and perished by the guillotine at Paris on July 25, 1794. He wrote an epithalamium on Louis XVI. and Marie Antoinette, gained the favour of Turgot, and obtained a salt-tax collectorship. His main poem was entitled *Les Mois*; it appeared in 1779, was praised in MS., damned in print, and restored to a just appreciation by the students of literature of the present century. It has the drawbacks of merely didactic-descriptive poetry on the great scale, but much grace and spirit in parts. Roucher was by no means anti-revolutionary, but ill-luck and perhaps his unpopular employment made him a victim of the Revolution. He lay in prison for nearly a year before his death, and went to it on the same tumbril with Chénier. The malicious wit of Rivarol's *mot* on the ill-success of *Les Mois*, "C'est le plus beau naufrage du siècle," is not intelligible unless it is said that one of the most elaborate passages describes a shipwreck.

ROUEN, a city of France, the ancient capital of Normandy, and now the administrative centre of the department of Seine Inférieure, the seat of an archbishopric and a court of appeal, and the headquarters of the third corps d'armée, stands on a level site on the right bank of the Seine in 49° 26' N. lat. and 1° 6' E. long. at the point where it is joined by the Aubette and

the small Rivière de Robec; it has also crept some distance up the hills which enclose the valley on the right, and has an extension on the plain on the left bank. The faubourgs by which it is surrounded are, reckoning from the east, Martainville (on the left bank of the Robec), St Hilaire, Beauvoisine, Bouvreuil, and Cauchoise; and the portion which lies on the left bank of the Seine is known as the Faubourg St Sever. Between the old town and the faubourgs runs a line of boulevards. Communication between the two banks of the river is maintained by ferry-boats and by two bridges; the upper bridge, a stone structure, is divided into two parts by the Lacroix island and decorated by a statue of Corneille; the lower is an iron suspension bridge which opens in the middle to let masted vessels pass. The railway from Havre to Paris crosses the Seine a little above Rouen, and having passed by a tunnel under the higher quarters of the city reaches a station on the north at a distance of 87 miles from Paris and 55 from Havre. Another station at Martainville is the terminus of the line from Rouen to Amiens; and at St Sever are those of the lines to Paris and to Orleans by Elbeuf. Since about 1860 wide streets have been driven through the old town, and tramway lines now traverse the whole city and its environs. Rouen, which is 78 miles from the sea, stands fourth in the list of French ports, coming next to Marseilles, Havre, and Bordeaux. Embankments constructed along the lower Seine have forced the river to deepen its own channel, and the land thus reclaimed has more than repaid the expenses incurred. The port is now accessible to vessels drawing 21 feet of water, and by means of easy dredgings this will be increased to from 25 feet to 28 according to the tide. The expansion of the traffic as the improvements have advanced is shown by the following returns: whereas in 1856 the number of vessels entered and cleared was 6220, with an aggregate burden of 570,314 tons, the corresponding figures were 4511 and 748,076 in 1876, and 5189 and 1,438,055 in 1880. What is now wanted is an increased amount of quay accommodation, the old line of quays scarcely exceeding 1 mile in length. The building of new quays and repairing-docks for large vessels is in active progress; the port is being dredged and deepened; and schemes are under consideration for a slip, a petroleum dock, and corn elevators.¹ Rouen has regular steamboat communication with Bordeaux, Spain, Algeria, London, Hull, Goole, Plymouth, Bristol, and Canada. A sunken chain allows boats to be towed up to Paris and beyond.

The population of the six cantons of Rouen in 1881 was 105,906, but if the suburbs are included the figure may be stated at about 150,000.

The imports landed at Rouen include cottons, wheat, maize, and petroleum from America; coal and iron from England, marble, oils, wines, and dried fruits from Italy; wines, wools, ores, and metals from Spain; grain and wool from the Black Sea; grapes from the Levant; rice from India; coffee from the French colonies; oil seeds, timber, dyewoods, foreign textile fabrics, Dutch cheese, &c. The articles of export comprise grain, table fruits, oil-seeds and oilcake, sugar, olive oil, palm oil, timber, hemp, linen, and wool, marble, granite, hewn stone, plaster and building materials, sulphur, coal, pig-iron, steel, copper, lead, zinc, salt, dyestuffs and other chemical products, wines, brandy, ciders, earthenware and glassware, machinery, packing-paper, &c.

Cotton spinning and weaving are carried on in the town, and especially the manufacture of *rouenneries* (cotton fabrics woven with dyed yarn). In this connexion the department of Seine Inférieure gives employment to 200,000 workmen, most of them in Rouen and

¹ See De Coene, *Congrès de l'Association Française pour l'avancement des sciences*, Rouen, 1883.

uinary siege; he proposed making it one of his Continental residences, but it was never completed. It was in Philip Augustus's castle that Joan of Arc was imprisoned and tried, and one of the public squares was the place where she was burned alive in 1431. From that year began a series of attempts on the part of the French to recapture the town. Ricardville in 1432 and Xaintrailles in 1436 failed in spite of the secret connivance of the inhabitants. In 1449 a stronger and better-planned expedition was successful, and Somerset, the English commander, was obliged, in order to secure an honourable capitulation, to surrender the principal fortified places in Normandy. The English rule, though badly supported by the citizens, had not been without its influence on the prosperity of Rouen. It was then that the present church of St Ouen was continued and almost completed; the foundation was laid in 1311, but the choir alone had been constructed in the 14th century. In spite of the juxtaposition of the second and third or "radiant" and "flamboyant" styles of Gothic, the building taken altogether presents in its general lines the most perfect unity—a unity which even the modern addition of a façade with two bell towers has failed to mar, though no regard was had to the original plans. St Ouen is the largest church erected in France during the War of the Hundred Years; in length (450 feet) it exceeds the cathedral. The central tower, not unlike the Butter Tower, with which it is contemporary, is 265 feet high; the two new towers with their spires are somewhat lower. Apart from its enormous dimensions and the richness of its southern portal, St Ouen has nothing that need long detain the visitor; its style is cold and formal; the interior, bare and stripped of its ancient stained glass, was further despoiled in 1562 and in 1791 of its artistic treasures and of almost all its old church-furniture. The organ dates from 1630, and the rather handsome roodscreen from the 18th century. The close of the 15th century and the first half of the 16th—the reigns of Charles VIII., Louis XII., Francis I., and Henry II., and the episcopates of Cardinal Estouteville (1453–1483), Cardinal Georges d'Amboise (1494–1510), and his nephew of the same name (1511–50)—rendered Rouen for nearly a hundred years the metropolis of art and taste in France; and it was one of the first towns where the splendours of the Renaissance burst forth. At this time the church of St Maclou was erected, a building that can hardly be brought into comparison with the cathedral and St Ouen, but is justly celebrated for the value and variety of its artistic treasures, such as the carved work of the principal doors, partly executed by Jean Goujon, the beautiful stained glass, and an organ-loft reached by an open-work staircase. The spire, 285 feet high, is a structure of the present century. Beside the church is the old parish cemetery, called the *Aître de Saint Maclou*, surrounded by charming Renaissance galleries and famous for its *danse macabre* formed by a series of sculptured groups. Other churches of the same period—St Godard, St Patrice, St Vincent—are no less interesting from the profusion of their architectural details than from their magnificent 16th-century stained-glass windows. There are two glass windows in St Godard, and a regular collection in St Patrice; but the latter, though he most famous, are in the eyes of connoisseurs of less worth than the stained glass in St Vincent, due to two incomparable artists of Beauvais, Engrand and Jean Le Prince,—the two principal subjects created by them being the Gifts of Mercy and the Glorification of the Virgin. St Godard contains, besides, old frescos worthy of note. The church of St Laurent, no longer used for worship, and the tower of St André are both of 16th-century origin. At the same period the cathedral received great embellishments, the central *flèche* was erected, and the portals were decorated with new sculptures. Georges d'Amboise, the virtuous minister of Louis XII., chose the chapel of the Virgin for his place of burial; he caused his mausoleum, constructed after the plans of the architect Roland le Roux, to be composed entirely of marble, as well as his statue, which he ordered from Jean Goujon. Georges d'Amboise the second was, according to his desire, interred in his uncle's tomb, but his statue is of much less value. Near this tomb are two others erected for the lords of Brézé; both are very remarkable; the oldest belongs to the Gothic style; the other, the tomb of Diana of Poitiers's husband, is a Renaissance structure of the time of Henry II., but, contrary to what was long believed, contains nothing from the hand of Jean Goujon. Under Louis XII. the archbishops of Rouen also rebuilt their palace at the side of the cathedral; but in spite of the richness of its architecture this lordly mansion cannot compete with the "palace of justice" begun in the same year, 1499, when the *châquequer* of Normandy, which had been established at Rouen in 1302, was erected into a *parlement*, though the title was not adopted till 1515. This sumptuous building is in the Gothic style; but the Hôtel de Bourgtheroulde, which dates from the time of Francis I., is undisputedly of the Renaissance, and is justly celebrated for its bas-reliefs, the subjects of which are borrowed from two quite different orders of things—the allegories from Petrarch's *Triumphs*, and the interview of the Field of the Cloth of Gold between Henry VIII. and Francis I. Many other secular Renaissance buildings in Rouen bear witness to the great commercial prosperity of its citizens and to their keen appreciation of the

arts:—numerous private houses in stone and especially in wood; the gate of the great clock; and a unique structure, the "*fierte*" of St Romain, a sort of pulpit from which every year a person condemned to death raised before the people the shrine or *fierte* (*feretrum*) of St Romain, and then received pardon and liberty.

This splendour of the arts began to decline during the wars of religion; in 1562 the town was sacked by the Protestants, which did not prevent the League from obtaining so firm a footing there that Henry IV., after having vainly besieged it, did not obtain entrance till long after his abjuration. To the 18th century belong the exchange and the claustral buildings of the abbey of St Ouen, transformed into an *hôtel de ville*. Much more important works have been executed in recent times, but in great part at the expense of the historic and picturesque features of the town. On the other hand, handsome structures of various kinds have been erected in the interests of public utility or embellishment—churches, civil and military establishments, fountains, statues, &c.; and many old buildings have been carefully restored or completed. Rouen, moreover, has recently been provided with museums of antiquities, of fine arts, of ceramic art, of natural history, and of industry,—the first two being very important. During the Franco-German War the city was occupied by the invaders from 5th December 1870 to 22d July 1871, and had to submit to heavy requisitions. Among the famous men born at Rouen are the brothers Corneille, Fontenelle, the journalists Armand Carrel and De Villemessant, the composer Boieldieu, the painters Jouvenet, Restout, and Géricault, the architect Blondel, Dulong the physicist, and La Salle the American explorer. (A. S.-P.)

ROUGE. This name is applied to various colouring substances of a brilliant carmine tint, especially when used as cosmetics. The least harmful of these preparations are such as have for their basis carthamine, obtained from the safflower (*Carthamus tinctorius*). The Chinese prepare a rouge, said to be from safflower, which, spread on the cards on which it is sold, has a brilliant metallic green lustre, but when moistened and applied to the skin assumes a delicate carmine tint. Jeweller's rouge for polishing gold and silver plate is a fine red oxide of iron prepared by calcination from sulphate of iron (green vitriol).

ROUGET DE LISLE, CLAUDE JOSEPH (1760–1836), one of the most noteworthy of those authors whom a single short piece of work has made famous, was born on 10th May 1760, at Lons-le-Saunier. He entered the army as an engineer and attained the rank of captain. He wrote complimentary verses pretty early, and appears to have been a good musician. The song which has immortalized him, the *Marseillaise*, was composed at Strasburg, where Rouget de Lisle was quartered in April 1792, and he is said to have composed both the words and the music in a fit of patriotic excitement after a public dinner. The piece was at first called *Chant de l'armée du Rhin*, and only received its name of *Marseillaise* from its adoption by the Provençal volunteers whom Barbaroux introduced into Paris, and who were prominent in the storming of the Tuileries. The author himself was unfavourably affected by that very event. He was a moderate republican, and was cashiered and thrown into prison; but the counter-revolution set him at liberty. Little is recorded of his later years, and he received no pension or other mark of favour till the accession of Louis Philippe. He died at Choisy on the 26th June 1836.

The *Marseillaise* (of which as usually given six-sevenths only are Rouget's) is so well known that no elaborate criticism of it is necessary. The extraordinarily stirring character of the air and its ingenious adaptation to the words serve to disguise the alternate poverty and bombast of the words themselves. As poetry the sixth stanza alone has much merit. Rouget de Lisle wrote a few other songs of the same kind, and set a good many of others' writing to music. He also produced a play or two and some translations. But his chief literary monument is a slender and rather rare little volume entitled *Essais en Vers et en Prose* (Paris, 1796). This contains the *Marseillaise*, a prose tale of the sentimental kind called *Adelaide at Monville*, and a collection of occasional poems of various styles and dates, from which the author's poetic faculty can be fairly judged. It is humble enough. Rouget was a mere follower of standard models, imitating by turns J. B. Rousseau, La Fontaine, and Voltaire, and exaggerating the artificial language of his time. In *Tom et Lucy*, which turns on a romantic story of

the English army in America, he has contrived without in the least knowing it to make a pathetic subject supremely ludicrous. But he seems to have been a very well meaning and harmless person, and he had one moment of remarkable inspiration.

ROULERS, or ROUSSELAERE, a town of Belgium, in the province of West Flanders, on the Mandelbeke, a tributary of the Lys, 22½ miles south of Ostend on the railway to Courtrai. From time immemorial it has been the seat of a great weaving industry, which now produces both cotton, union, and linen goods; and it also manufactures in various other departments. The principal buildings are the town-house, the college, and the church of St Michel with its conspicuous Gothic tower. The population was 16,345 in 1874, and 17,219 in 1884.

Roulers is mentioned in 822 as Roslar and in 847 as Rollare. Baldwin VIII., count of Flanders, died in a house in the principal square of the town in 1120 on his return from the battle of Angers. In 1794 Roulers was the scene of a conflict between the Austrians and the French.

ROUM (RÚM) is the name by which the Arabs call the Romans, *i.e.*, all subjects of the Roman power. *Bilád al-Rúm*, "the lands of the Romans," accordingly means the Roman empire. The parts of the old empire conquered by the Arabs were regarded as having ceased to be Roman, but the Western Christian lands were still called lands of the Rúm, without reference to the fact that they had in great part ceased to pay any allegiance to the "king of the Rúm," *i.e.*, the Byzantine emperor. When Ibn Jobair takes a passage in a Genoese vessel he speaks of the crew as Romans; and in Spain a "Rúmíya" meant a "Christian slave-girl." Sometimes all Europe is included in the lands of the Rúm; at other times the northern nations are excluded; sometimes again the word means the Byzantine empire; and, finally, the kingdom founded by the Seljûks, in lands won by them from Byzantium, is the kingdom of the Seljûks of Rúm, so that Rúm comes to take the restricted sense of Asia Minor. So Abulfeda uses the term. Roumelia and Roumania in like manner mean no more than the "Roman country" in a special limitation.

Plate I.

ROUMANIA, a kingdom in the south-east of Europe between the Carpathians, the Pruth, the Black Sea, and the Danube. The Pruth and the Kilia mouth of the Danube now form the frontier with Russia. West of Silistria the Danube is the boundary between Roumania and Bulgaria, while to the east of that point the boundary is formed by an irregular line passing east by south to the coast about ten miles to the south of Mangalia. The territory thus shut off between the Danube and the Black Sea is known as the DOBRUDJA (*q.v.*), and differs in its physical features and products from the rest of the kingdom. It was given to Roumania at the close of the last Russo-Turkish War as a compensation for the territory of Bessarabia, east of the Pruth, which was then restored to Russia. The area of the kingdom is estimated at about 49,250 square miles, which is rather less than that of England without Wales. The greatest length of the kingdom is from east to west near the parallel of 45°, along which the length is about 350 miles. The line stretching from north-west to south-east between the extreme points of the kingdom is about fifteen miles shorter.

The crescent-shaped portion of the kingdom lying between the Danube and Pruth and the Carpathians is tolerably uniform in its physical features. The southern part of the area is a plain continuous with that of southern Russia. Towards the interior the surface rises gradually but slowly until we come to the spurs of the Carpathians. The Roumanian frontier on this side runs for the most part along the very crest of the mountains, which have peaks rising to from 6000 to 8000 feet and upwards. The lowest part of this plain is that which stretches along the left bank of the Danube, and this also

is the dreariest and least productive. Large tracts of it are marshy and subject to inundation, and even beyond the marshy districts the aspect of the country remains extremely uninviting. Agriculture is neglected; coarse grasses occupy large areas; and the most conspicuous feature in the landscape is probably a rude well, such as is seen in the pusztas of Hungary and some parts of southern Russia, where the general aspect of the country is so like what we find here. Farther inland, however, the appearance of the surface improves: agriculture becomes more general, trees (willows, alders, and poplars) more abundant; on the still higher ground nearer the Carpathians the outward signs of comfort and prosperity become more and more apparent; the vine clothes the hill slopes; plums, peaches, and southern fruits are grown in profusion; large forests of oak, beech, and elm reach to the hill tops, and various minerals form an important addition to the present and prospective resources of the country. At elevations too high for the foliage trees just mentioned these are succeeded by pines and firs, birches and larches, which crown the mountains to a height of 5000 or 6000 feet. Extensive as the plains of Roumania are, 40 per cent. of the entire surface is more than a thousand feet above sea-level, while the greater part of the northern (or Moldavian) half of the crescent varies from 300 to 1000 feet, almost all the rest of Moldavia being still more elevated.

The superficial geology of Roumania, so far as it is known, is extremely simple, at least on the left bank of the Danube. Quaternary deposits are spread over all the plains. Among these the most important is the yellow loess, which covers such large areas in Hungary also, and which in Roumania attains in places a depth of 150 to 300 feet. In certain parts the black soil of southern Russia extends into Roumania, and is important on account of its richness, though its depth is nowhere above 3 feet. Advancing inland one meets next with Miocene and Eocene deposits, until, in ascending the slopes of the Carpathians, Secondary, Primary, and crystalline rocks are seen to crop out in succession. The desolate plateau of the Dobrudja contrasts with the region on the left of the Danube in its geology as in other respects. Its basis consists of crystalline rocks, but these are covered with sedimentary formations of various ages. On the north this plateau, which is hilly and even mountainous, sinks down rather abruptly to the delta of the Danube, a congeries of alluvial marshes occupied chiefly by aquatic and marsh-loving birds.

Of the rivers of Roumania by far the most important Rivers is the Danube, which is navigable for large vessels throughout its Roumanian reach, the first obstruction to navigation, the celebrated Iron Gates, occurring just where it enters Roumanian territory. The breadth of the river is of some consequence in view of the fact that it is a frontier stream, and the marshes on the left bank have at least this advantage that they enable it to serve all the more effectually as a natural boundary. The plains on the left are traversed by numerous winding tributaries of the Danube, but of these the only one of importance as a means of communication is the Pruth, which is navigable for small grain-carrying vessels. The others—the Sereth, Jalomitza, Dambovitza, Olta—are sluggish streams, often half-dry, but yet at certain seasons subject to inundations, which unfortunately occur at a time when the crops are so far advanced as to be liable to be much damaged. In consequence of this the Government has bestowed much pains on the regulation of these streams, and the works for this purpose are rendered further serviceable by the fact that the Roumanian rivers can be turned to account for irrigation.

Climate. The climate of Roumania is one of extremes as regards temperature. Winter and summer are almost equally trying. In the former season the thermometer may sink to -15° Fahr., while in the latter it may rise to from 90° to 95° . The mean temperature of spring at Bucharest is 53° , summer $72\frac{1}{2}^{\circ}$, autumn 65° , winter $27\frac{1}{2}^{\circ}$. Spring, however, scarcely exists except in name, the interval between the cold winter and hot summer being very short. The autumn, on the other hand, is long and is the most genial season of the year. It lasts to the end of November. Being continuous with the Russian plain, Roumania is exposed to the bitterly cold wind from the north-east by which southern Russia is also scourged. In Roumania this wind, known as *crivets*, blows on an average 155 days in the year, while a west or south-west wind, called the *austru*, equally disagreeable for its scorching heat, blows on an average 126 days. The rainfall is not excessive. The number of rainy days in the year is about 74, or only about two-fifths of the number round London. The summer months are those in which the rains are most abundant. Snow is unfrequent (12 days in the year). As regards salubrity the low-lying plains near the Danube are the worst part of the kingdom. Marsh fever is there prevalent, and the tendency to suffer from disease is increased by the miserable character of the dwellings occupied by the peasantry of that district. The houses are mere pits dug out in the ground and covered over with sloping roofs formed of branches and twigs.

Agri-culture. Three-fourths of the population are dependent upon agriculture. The plains covered by loess and black soil are admirably adapted for the growth of cereals, and of these the most important are maize, wheat, and barley. The methods of cultivation are to a large extent primitive and imperfect, but great improvements are taking place through the application of foreign capital to the development of the native resources. Improved agricultural implements of all kinds have been introduced of late years in great numbers. The old plough, which has a share resembling a lance head, which enters the ground horizontally and thus merely scratches the surface, is being rapidly superseded by ploughs of English and Austrian manufacture. These improvements, which have been greatly stimulated by the alteration in the status of the Roumanian peasantry brought about by the law of 1864, and likewise by the introduction of railways, have resulted in an enormous increase in the amount of the production of cereals. Roumania is one of the principal grain-exporting countries in Europe, and the increase in the production just alluded to is sufficiently well indicated by the figures given below relative to the exports of grain to the United Kingdom. The great variations in these figures, though obviously due in part to political causes, likewise serve to illustrate the chief drawback under which Roumanian agriculture labours—namely, the liability to drought.

Besides forming a valuable article of export maize furnishes the chief food of the people. The great body of Roumanians seldom eat meat except on feast days, and the favourite food is a dish called *mamaiga*, made by boiling maize-meal and flavouring it with a little salt. It thus resembles the hominy of the Americans. In addition to cereals many kinds of vegetables, including garlic, melons, and cucumbers, are grown. Hemp and colza are also important products, and tobacco furnished a considerable article of export until it was made a monopoly of the state in 1872. As already mentioned, wine and numerous fruits are produced on the foot-hills of the Carpathians, but owing to neglect the products are greatly inferior to what they ought to be. Nothing, it is said, but care in the cultivation of the vine and the preparation and preservation of the wine is necessary to make Roumania a wine-growing country of the first rank. As it is, vines are estimated to cover only about 250,000 acres, or about $\frac{1}{15}$ of the entire surface. From plums the Roumanians extract a strong spirit known as *tsuica*, and it is chiefly for this that the plum-tree is cultivated.

The rearing of domestic animals is likewise an important industry, but it has not advanced so much of late years as the growth of cereals. The exports of cattle are almost stationary. Oxen are of much more importance than horses, being chiefly used in field labours. Buffaloes also are reared for the purpose, and are much valued for their strength. Sheep and cattle rearing forms the chief occupation of the sparse population of the Dobrudja.

Forests. About one-sixth of the total surface of Roumania is estimated to be covered with forests producing valuable timber trees. Oaks, fir, and beeches are said to be met with having a diameter of more than 8 feet at the height of 33 feet above the ground. The warm

summers and cold winters are favourable to the quality of the wood, which is hard and lasting. Unfortunately there is a good deal of recklessness in the way in which the forests are utilized, and they are said to be fast disappearing; but it is to be hoped that the influence of the College of Agriculture and Sylviculture at Ferestren, 2 miles from Bucharest, will help to put a check upon this improvidence, as it is without doubt contributing greatly to the promotion of Roumanian agriculture.

The mineral wealth on the Roumanian side of the Carpathians Minerals is considerable, but at present there are only three minerals that have any great industrial importance. These are rock-salt, petroleum, and lignite. The salt mines are a state monopoly, and two of them, at Oena-Mare and Telegra, are partly worked by convicts. The depth from which the salt is extracted nowhere exceeds 300 feet. The average quantity of salt sold annually is about 62,000 tons. Lignite is important inasmuch as it is used along with wood on the railways, as well as in brick and lime kilns. Coal is also found, in some places even at the surface, but, though one or two mines have been opened, the total production is insignificant. Ozocerite, or fossil wax, is frequently found in association with lignite, but is used only in small quantity by the peasantry. Among other minerals are anthracite, iron, gold, copper, lead, sulphur, cobalt, and arsenic; and there is little doubt that some of these at least might be made economically valuable if the resources of the country were adequately developed.

So far the manufacturing industries of Roumania are hardly Manu-worthy of mention. There are petroleum refineries, one or two factories, sugar refineries, numerous steam-mills for grinding flour, besides large numbers of floating maize-mills on the Danube; but in addition to these there are only a few manufactories at Galatz.

From the account just given of the products of Roumania it Trade. follows that the exports of the kingdom consist chiefly of raw produce, and above all of cereals, while the imports are mainly composed of manufactured articles. The countries with which the trade is chiefly carried on are Austria (with about 40 per cent. of the whole trade in 1883), Great Britain (about 30 per cent.), France (about 10 per cent.), Germany (about 8 per cent.), Turkey, and Russia. The foreign commerce of Roumania is centred in Galatz, which is situated at the bend of the Danube where the river once more turns eastward on reaching the northern extremity of the Dobrudja plateau. From this centre there is one line of railway leading into Russia, while others pass through the interior of Roumania and connect with the Austrian lines in the north and south of Hungary. The first Roumanian railway was that from Giurgevo to Bucharest, opened in 1869. In 1884 there were about 1000 miles of railway in the kingdom. The internal trade of Roumania is almost entirely in the hands of the Jews. It is greatly hampered by the existence of the octroi in all the large towns, almost all the necessaries of life as well as luxuries being taxed when introduced within the municipal boundaries.

See Samuelson, *Roumania, Past and Present* (London, 1892); Ozanne, *Three Years in Roumania* (London, 1878); Kanitz, *Donau-Bulgarien und der Balkan* (1879); and R. Roessler, *Romanische Studien*. (G. G. C.)

Statistics.

The approximate proportion of cultivated and uncultivated land Produce. in Roumania is given in pogones ($=1\frac{1}{2}$ acres) as follows:—

Cereals, gardens, vines	4,945,708
Pasture and hay.....	7,693,910
Forests.....	4,029,947
Uncultivated.....	7,574,336

The annual yield of cereals of all kinds is roughly estimated at 15,000,000 quarters. The number of horned cattle in the country is about 8,000,000.

In 1883 the following were the values of the principal articles Imports and exports.

	Imports.	Exports.		Imports.	Exports.
	£	£		£	£
Textiles.....	4,706,063	248,504	Minerals, pottery..	455,510	12,760
Metals.....	2,926,376	78,198	Oils, fat, &c.....	374,387	5,992
Skins, leather.....	1,749,674	257,136	Cereals.....	281,377	6,902,280
Wood and manu- factures.....	754,754	323,372	Animals.....	159,420	455,682
Exotic products...	713,000	24,080	Fruits, vegetables..	62,846	171,381

The total imports of British home produce, mostly cotton goods, &c., and iron, into Roumania in 1883 amounted to £1,344,619, and the total exports, mostly barley and maize, of Roumania to Great Britain to £3,516,442.

There were in 1884 about 1000 miles of railway complete in the kingdom, and 3000 miles of telegraph lines.

The estimated population of the country is 5,376,000, including Popula- millions of the population belong to the Roumanian branch of the Orthodox Greek Church, and there are 114,000 Roman Catholics and 18,800 Protestants.

An official analysis of the occupations of the people gives the following results (the figures representing heads of families):—

Agriculturists.....	684,168
Artisans and labourers.....	83,061
Traders.....	30,417
Officials.....	22,811
Professors and teachers.....	6,066
Medical and legal professions and druggists..	995
Artists, musicians, and publicists.....	2,156
Priests, monks, and nuns.....	18,452
Various.....	125,815

Total..... 973,941

Of the larger cities Bucharest (Bucurest) numbered in 1876 221,805 inhabitants, Jassy 90,125, and Galatz 80,763.

**Educa-
tion.** In 1883 there were 2742 primary schools with 124,130 pupils, 8 normal schools with 830 pupils, and 54 high schools with 7993 pupils, besides the two universities of Bucharest and Jassy, containing 97 professors and readers and 705 students. It is estimated that about 1000 young men receive their university education abroad, mostly at Paris. There is also a ladies' college, called the Asyle Hélène from its founder in its present form, the Princess Helena Cuza, and accommodating 230 girls, many of whom are orphans. Amongst learned institutions the Roumanian Academy claims the first place, and excellent contributions on subjects of national and scientific interest will be found amongst its proceedings (*Analele Academiei Romane*, 1878 sq.). The academy building at Bucharest contains the national library of over 30,000 volumes and a fine archaeological museum containing many Old Dacian antiquities.

Army. The peace strength of the permanent army consists of 1200 officers and 18,532 men, with 180 guns. Besides this, there are the territorial army, consisting of 120,000 men and 84 guns; the militia, consisting of thirty-two regiments of infantry; and finally the *levée en masse*. Every Roumanian, from his twenty-first to his forty-sixth year, is obliged to serve his time in one of the above categories. The total of the Roumanian forces, exclusive of the *levée en masse*, amounts to about 150,000 men and 288 guns.

Mediæval and Modern History of Walachia and Moldavia.

Roumania is the name officially adopted by the united kingdom that comprises the former principalities of Walachia and Moldavia. In its native form it appears simply as "Romania," representing the claim to Roman descent put forward by its inhabitants. These call themselves "Romani" or "Rumeni," but by their neighbours, Slavonic, Greek, Magyar, and German, they are universally known by one or other form of the word "Vlach." As, however, this Vlach or Rouman race occupies a far wider area than that included in the present Roumanian kingdom, it may be convenient to postpone the vexed questions connected with its origin, migrations, and distribution for more general treatment under the heading VLACHS, and to confine ourselves on this occasion to Roumania proper—the country between the Carpathians, the Lower Danube, and the Black Sea. It may be sufficient here to observe that, according to the concurrent accounts from various sources, the great plains of the later Walachian and Moldavian principalities were first occupied by an immigrant Rouman population coming from the Carpathian lands and the present Transylvania in the early Middle Ages. According to the Russian Nestor and the earliest Hungarian chroniclers, the Carpathian region, including tracts of eastern Hungary, were occupied by a Rouman ("Roman") population at the time of the Magyar invasion in the 9th century. On the other hand, the meagre annals of the plains that lie on the left bank of the Lower Danube are exclusively occupied till at least the 11th century with Slovenes, Petchenegs, Cumans, and Bulgarians. Whatever title the Carpathian Roumans may have to be considered the descendants *in situ* of the Romanized provincials of Trajan's Dacia, it seems fairly ascertained that the present extension of this easternmost branch of the Latin peoples over the Walachian and Moldavian plains is due to a colonizing movement from the Alpine regions to the west, effected for the most part in the 12th and succeeding centuries.

Walachia.—For the early history of the Walachian (Valachian, or Wallachian) principality the native sources are late and untrustworthy. These sources really reduce themselves to a single chronicle, a part of which appears to have been drawn up in the 16th century in Bulgaro-Slovene, and of which two Rouman translations have seen the light. This "History of the Rouman land since the arrival of the Roumans" (*Istoria țerei Romanesci de cândă au descălitcată Romanii*) gives a precise account of the founding of the Walachian state by Radul Negru, voivode of the Roumans of Fogaras in Transylvania, who in 1290 descended with a numerous people into the Transalpine plain and established his capital first at Cîmpulung and then at Argish. Radul dies in 1314 and is succeeded by a series of voivodes whose names and dates are duly given; but this early chapter of Walachian history has been

rudely handled by Roesler in his essay on the oldest history of the Walachian voivodeship (*Romänische Studien*, p. 261 sq.). The so-called "Chronicle of Hurul" is a modern forgery, and our only real authorities for the beginnings of Roumanian history are Hungarian, Polish, and Byzantine.

In 1330 the voivode Alexander Bazarad or Bassaraba succeeded Hun-in inflicting a crushing defeat on his suzerain King Charles of garian Hungary, and for fourteen years Wallachia enjoyed complete inde-supre-pendence. Louis the Great succeeded for a while in restoring the macy. Hungarian supremacy, but in 1367 the voivode Vlad or Vladislav inflicted another severe defeat on the Hungarians, and succeeded for a time in ousting the Magyar ban of Severin and thus incorporating Little Walachia, the country west of the Aluta, in his dominions. Subsequently, in order to retain a hold on the loyalty of the Walachian voivode, the king of Hungary invested him with the title of duke of Fogaras and Omlas, Rouman districts situate in Transylvania, and this investiture seems to have left its impress on the traditional account of Radul Negru.

Under the voivode Mircea (1383-1419), whose prowess is still Mircea. celebrated in the national folk-songs, Walachia played for a while a more ambitious part. This prince, during the earlier part of his reign, sought a counterpoise to Hungarian influence in the close alliance with King Vladislav Jagiełło of Poland. He added to his other titles that of "count of Severin, despot of the Dobrudja, and lord of Silistria," and both Widin and Sistov appear in his possession. A Walachian contingent, apparently Mircea's, aided the Servian Kniaz Lazar on the fatal field of Kosovo; later he was led by the force of circumstances to ally himself with his former enemy Sigismund of Hungary against Bajazet, and in 1396 shared with him the disaster of Nikopolis. Bajazet subsequently invaded and laid waste a large part of Walachia, but the voivode succeeded in inflicting considerable loss on the retiring Turks, and the capture of Bajazet by Timur in 1402 gave the country a reprieve. In the internecine struggle that followed amongst the sons of Bajazet, Mircea espoused the cause of Musa; but, though he thus obtained for a while considerable influence in the Turkish councils, this policy eventually drew on him the vengeance of Sultan Mahomet I., who succeeded in reducing him to a tributary position.

During the succeeding period the Walachian princes appear alternately as the allies of Hungary or the creatures of the Turk. In the later battle of Kosovo of 1448, between Hunyadi and Sultan Murad, the Walachian contingent treacherously surrendered to the Turks, but this did not hinder the victorious sultan from massacring the prisoners and adding to the tribute a yearly contribution of 3000 javelins and 4000 shields. In 1453 Constantinople fell; in 1454 Hunyadi died; and two years later the sultan invaded Walachia to set up Vlad IV., the son of a former voivode. The Vlad the father of this Vlad had himself been notorious for his ferocity, Impaler. but his son, during his Turkish sojourn, had improved on his father's example. He was known in Walachia as "Dracul," or the Devil, and has left a name in history as Vlad the Impaler. The stories of his ferocious savagery exceed belief. He is said to have feasted amongst his impaled victims. When the sultan Mahomet, infuriated at the impalement of his envoy, the pasha of Widin, who had been charged with Vlad's deposition, invaded Walachia in person with an immense host, he is said to have found at one spot a forest of pales on which were the bodies of men, women, and children. The voivode Radul, who was now substituted for this monster by Turkish influence, was constrained to pay a tribute of 12,000 ducats.

The shifting policy of the Walachian princes at this time is State of well described in a letter of the Hungarian king Matthias to Walachia Casimir of Poland. "The voivodes," he writes, "of Walachia and *circ.* Moldavia fawn alternately upon the Turks, the Tatars, the Poles, 1500. and the Hungarians, that among so many masters their perfidy may remain unpunished." The prevalent laxity of marriage, the frequency of divorce, and the fact that illegitimate children could succeed as well as those born in lawful wedlock, by multiplying the candidates for the voivodeship and preventing any regular system of succession, contributed much to the internal confusion of the country. The elections, though often controlled by the Divan, were still constitutionally in the hands of the boiars, who were split up into various factions, each with its own pretender to the throne. The princes followed one another in rapid succession, and a large proportion met with violent ends. A large part of the population led a pastoral life, and at the time of Verantius's visit to Walachia in the early part of the 16th century the towns and villages were built of wood and wattle and daub. Tirgovist alone, at this time the capital of the country, was a considerable town, with two stone castles. Nagul Bassaraba, who succeeded in 1512, was a great builder of monasteries, and, besides erecting a monastic church at Argish, which he coated with white marble, and a new cathedral at Tirgovist, adorned Mount Athos with his pious works. He transferred the direct allegiance of the Walachian Church to Constantinople. On Nagul's death, however, in 1521, the brief period of comparative prosperity which his architectural works attest was tragically interrupted, and it seemed for a time

Turkish oppressions. that Walachia was doomed to sink into a Turkish pashalic. The Turkish commander Mahmoud Bey became treacherously possessed of Nagul's young son and successor, and, sending him a prisoner to Stamboul, proceeded to nominate Turkish governors in the towns and villages of Walachia. The Walachians resisted desperately, elected Radul, a kinsman of Nagul, voivode, and succeeded with Hungarian help in defeating Mahmoud Bey at Grumatz in 1522. The conflict was prolonged with varying fortunes, but in 1524 the dogged opposition of the Walachians finally triumphed in the sultan's recognition of Radul.

But, though Walachia thus escaped conversion into a Turkish pashalic, the battle of Mohacs in 1526 decided the long preponderance of Turkish control. The unfortunate province served as a transit route for Turkish expeditions against Hungary and Transylvania, and was exhausted by continual requisitions. Turkish settlers were gradually making good their footing on Walachian soil, and mosques were rising in the towns and villages. The voivode Alexander, who succeeded in 1591, and who like his predecessors had bought his post of the Divan, carried the oppression still further by introducing against the capitulations a janizary guard, and farming out his possessions to his Turkish supporters. Meanwhile the Turkish governors on the Bulgarian bank never ceased to ravage the country, and again it seemed as if Walachia must share the fate of the Balkan states and succumb to the direct government of the Ottoman. In the depth of the national distress the choice of the people fell on Michael, the son of Petrushko, ban of Krajova, the first dignitary of the realm, who had fled to Transylvania to escape Alexander's machinations. Supported at Constantinople by two at that time influential personages, Sigmund Báthori and the English ambassador, Edward Barton, and aided by a loan of 200,000 florins, Michael succeeded in procuring from the Divan the deposition of his enemy and his own nomination.

Michael the Brave. The genius of Michael "the Brave" (1593-1601) secured Walachia for a time a place in universal history. The moment for action was favourable. The emperor Rudolph II. had gained some successes over the Turks, and Sigmund Báthori, prince of Transylvania, had been driven by Turkish extortions to throw off the allegiance to the sultan. But the first obstacle to be dealt with was the presence of the enemy within the walls, and Michael had recourse to the same desperate expedient as the Montenegrins at a later date. By previous concert with the Moldavian voivode Aaron, on November 13, 1594, the Turkish guards and settlers in the two principalities were massacred at a given signal. Michael followed up these "Walachian Vespers" by an actual invasion of Turkish territory, and, aided by Sigmund Báthori, succeeded in carrying by assault Rustchuk, Silistria, and other places on the right bank of the lower Danube. A simultaneous invasion of Walachia by a large Turkish and Crim-Tatar host was successfully defeated; the Tatar khan withdrew with the loss of his bravest followers, and, in the great victory of Mantin on the Danube (1595), the Turkish army was annihilated, and its leader Mustafa slain. The sultan now sent Sinan Pasha "the Renegade" to invade Walachia with 100,000 men. Michael withdrew to the mountains before this overwhelming force, but, being joined by Báthori with a Transylvanian contingent, the voivode resumed the offensive, stormed Bucharest, where Sinan had entrenched a Turkish detachment, and, pursuing the main body of his forces to the Danube, overtook the rearguard and cut it to pieces, capturing enormous booty. Sinan Pasha returned to Constantinople to die, it is said, of vexation, and in 1597 the sultan, weary of a disastrous contest, sent Michael a red flag in token of reconciliation, reinvested him for life in an office of which he had been unable to deprive him, and granted the succession to his son.

Conquest of Transylvania. In 1599, on the definitive abdication of Sigmund Báthori in Transylvania, Michael, in league with the imperialist forces under General Basta, and in connivance with the Saxon burghers, attacked and defeated his successor Andreas Báthori near Hermannstadt, and, seizing himself the reins of government, secured his proclamation as prince of Transylvania. The emperor consented to appoint him his "locum tenens per Transylvaniam," and the sultan ratified his election. As prince of Transylvania he summoned diets in 1599 and 1600, and, having expelled the voivode of Moldavia, united under his sceptre three principalities. The partiality that he showed for the Rouman and Szekler parts of the population alienated, however, the Transylvanian Saxons, who preferred the direct government of the emperor. The imperial commissioner General Basta lent his support to the disaffected party, and Michael was driven out of Transylvania by a successful revolt, while a Polish army under Zamoyski invaded Walachia from the Moldavian side. Michael's coolness and resource, however, never for a moment deserted him. He resolved to throw himself on the emperor, rode to Prague, won over Rudolph by his singular address, and, richly supplied with funds, reappeared in Transylvania as imperial governor. In conjunction with Basta he defeated the superior Transylvanian forces at Gorosló, expelling Sigmund Báthori, who had again aspired to the crown, and taking one hundred and fifty flags and forty-five cannon. But at the moment

of his returning prosperity Basta, who had quarrelled with him about the supreme command of the imperial forces, procured his murder (August 19, 1601). Thus perished Michael the Brave in the forty-third year of his age, after performing in the course of his short reign achievements which, considering the small resources at his disposal, must place his name beside those of Hunyadi and Sobieski in the annals of eastern Europe. Not only did he succeed in rolling back for a time the tide of Turkish conquest, but for the first and last time in modern history he united what once had been Trajan's Dacia, in its widest extent, and with it the whole Rouman race north of the Danube, under a single sceptre.

Michael's wife Florika and his son Petrushko were carried off Turkish into Tatar captivity, and Serban, of the Bassaraba family, was dominated to the voivodeship of Walachia by imperialist influences. On his deposition by the Porte in 1610, there followed a succession of princes who, though still for the most part of Rouman origin, bought their appointment at Stamboul. Walachian contingents were continually employed by the Turks in their Polish wars, and the settlement of Greeks in an official or mercantile capacity in the principality provoked grave discontent, which on one occasion took the form of a massacre. The reign of the voivode Matthias Bassaraba, who succeeded in 1633, was an interval of comparative prosperity, and its length, twenty-one years, forms itself a panegyric. He defended himself successfully against his powerful rival Vasilje Lupul, the voivode of Moldavia, and his Tatar and Cossack allies, and found a golden key to Turkish tolerance. He appears as a lawgiver, translating the *Basilica* of Jo. Comnenus, and founded many churches and monasteries. His last days were embittered, however, by an outbreak of military anarchy. On his death the Turkish yoke again weighed heavier on Walachia. The old capital Tirgovist was considered by the Divan to be too near the Transylvanian frontier, and the voivodes were accordingly compelled to transfer their residence to Bucharest. The mechanical skill of the Walachians was found useful by the Turks, who employed them as carpenters and pontonniers; and during the siege of Vienna by Kara Mustafa in 1683 the Walachian contingent, which, under the voivode Serban Cantacuzene, had been forced to co-operate with Serban the Turks, was entrusted with the construction of the two bridges Cantacuzene over the Danube above and below Vienna. The Walachian as well as the Moldavian prince, who had been also forced to bring his contingent, maintained a secret intelligence with the besieged, an intelligence continued by the voivode Serban after his return to Walachia. The emperor granted him a diploma creating him count of the empire and recognizing his descent from the imperial house of Cantacuzene, Serban meanwhile collecting his forces for an open breach with the Porte. His prudence, however, perpetually postponed the occasion, and Walachia enjoyed peace to his death in 1688. This peaceful state of the country gave the voivode leisure to promote its internal culture, and in the year of his death he had the satisfaction of seeing the first part of a Walachian Bible issue from the first printing-press of the country, which he had established at Bucharest. He had also caused to be compiled a history of Walachia, and had called to the country many teachers of the Greek language, whose business it was to instruct the sons of the boiars in "grammar, rhetoric, and philosophy."

Immediately on Serban's death the boiars, to prevent the Porte Constantine Brancovan, it is true, found it expedient to devote his predecessor's treasure to purchasing the confirmation of his title from the Divan, but the account of his coronation ceremony remains an interesting landmark in the constitutional history of the country. In his foreign relations with the Hapsburg power he displayed the same caution as the voivode Serban. In spite of the victories of the margrave of Baden at Pojarevatz, Nish, and Widin in 1689, it was only by an exercise of force that the imperial troops secured winter quarters in Walachia, and, though after the battle of Pultava in 1709 Brancovan concluded a secret treaty with Czar Peter, he avoided giving open effect to it. The tranquillity which he thus obtained was employed by Brancovan as by his predecessor in furthering the internal well-being of the country, with what success is best apparent from the description of Walachia left by the Florentine Del Chiaro, who Del visited the country in 1709 and spent seven years there. He describes the stoneless Walachian plain, with its rich pastures, its crops of maize and millet, and woods so symmetrically planted and carefully kept by Brancovan's orders that hiding in them was out of the question. Butter and honey were exported to supply the Grand Signor's kitchen at Stamboul; wax and cattle to Venice; and the red and white wine of Walachia, notably that of Pitesti, to Transylvania. The Walachian horses were in demand amongst

the Turks and Poles. Near Ribnik and elsewhere were salt-mines which supplied all the wants of the Transdanubian provinces; there were considerable copper mines at Maidan; and iron was worked near Tirgovist. The Gipsy community was bound to bring fifteen pounds weight of gold from the washings of the Argish. The boiars were many of them wealthy, but the common people were so ground down with taxation that "of their ancient Roman valour only the name remained." To avoid the extortion of their rulers numbers had emigrated to Transylvania and even to the Turkish provinces. The principal Walachian city was Bucharest (Bucurest), containing a population of about 50,000; but, except for two large "hans" or merchants' halls built by Brancovan and his predecessor, and the recently-erected palace, which had a marble staircase and a fine garden, the houses were of wood. The other principal towns were Tirgovist, the old capital, Cernetz, Fokshani, supplied by Brancovan with an aqueduct, Ploiesti, Ghierghitza, Rusi di Vede, and Krajova, the capital of the banat of that name, where a fine han had also been built. At Cimpulungu was a great annual fair. The dress of the men was thoroughly Turkish except for their lambskin caps, that of the women half-Greek half-Turkish. The houses were scrupulously clean and strewn with sweet herbs. Del Chiaro notices the great imitative capacity of the race, both artistic and mechanical. A Walachian in Venice had copied several of the pictures there with great skill; the copper-plates and wood engravings for the new press were executed by native hands. The Walachians imitated every kind of Turkish and European manufacture; and, though the boiars imported finer glass from Venice and Bohemia, a glass manufactory had been established near Tirgovist which produced a better quality than the Polish. From the Bucharest press, besides a variety of ecclesiastical books, there were issued in the Rouman tongue a translation of a French work entitled "The Maxims of the Orientals" and "The Romance of Alexander the Great." In 1700 Brancovan had a map of the country made and a copper-plate engraving of it executed at Padua.

Fall of
Bran-
covan.

The prosperity of Walachia, however, under its "Golden Bey," as Brancovan was known at Stamboul, only increased the Turkish exactions. In 1701 the tribute was increased to 80,500 purses of 500 florins each. In 1703 the voivode was summoned in person to Adrianople, and again must resort to extraordinary means to mollify the Divan. Shortly after, the Walachians were called on to supply masons, carpenters, and other workmen for the fortification of Bender, and, though these and other demands were punctually met and the increased tribute regularly paid, the sultan finally resolved on the removal of his too prosperous vassal. Brancovan was accused of secret correspondence with the emperor, the czar, the king of Poland, and the Venetian republic, of betraying the Porte's secrets, of preferring Tirgovist to Bucharest as a residence, of acquiring lands and palaces in Transylvania, of keeping agents at Venice and Vienna, in both of which cities he had invested large sums, and of striking gold coins with his effigy, one of which, with the legend CONSTANTINVS BASSARABA DE BRANCOVAN D. G. VOEVODA ET PRINCEPS VALACHIAE TRANSALPINAE, and having on the reverse the crowned shield of Walachia containing a raven holding a cross in its beak between a moon and a star, is engraved by Del Chiaro. They were of 2, 3, and 10 ducats weight. A capidji pasha arrived at Bucharest on April 4, 1714, and proclaimed Brancovan "mazil," i.e., deposed. He was conducted to Constantinople and beheaded, together with his four sons. A scion of the rival Cantacuzenian family was elected by the pasha's orders, and he, after exhausting the principality for the benefit of the Divan, was in turn deposed and executed in 1716.

The
Fan-
ariote
regime.

From this period onwards the Porte introduced a new system with regard to its Walachian vassals. The line of national princes ceases. The office of voivode or hospodar was sold to the highest bidder at Stamboul, to be farmed out from a purely mercenary point of view. The princes who now succeeded one another in rapid succession were mostly Greeks from the Fanar quarter of Constantinople who had served the palace in the quality of dragoman, or held some other court appointment. They were nominated by imperial firman without a shadow of free election, and were deposed and transferred from one principality to another, executed or reappointed, like so many pashas. Like pashas they rarely held their office more than three years, it being the natural policy of the Porte to multiply such lucrative nominations. The same hospodar was often reappointed again and again as he succeeded in raising the sum necessary to buy back his title. Constantine Mavrocordato was in this way hospodar of Walachia at six different times, and paid on one occasion as much as a million lion-dollars for the office. The princes thus imposed on the country were generally men of intelligence and culture. Nicholas Mavrocordato, the first of the series, was himself the author of a Greek work on duties, and maintained at his court Demeter Prokopios of Moschopolis, who wrote a review of Greek literature during the 17th and beginning of the 18th centuries. Constantine Mavrocordato was the author of really liberal reforms. He introduced an "urbanism" for the peasants, limiting the days of "angaria," or forced labour for the landlord, to twenty-four, and in 1747 decreed the abolition of serfdom. But

the new system could not but be productive of grinding oppression, and the swarms of "hungry Greeklings" who accompanied the Fanariote rulers from Stamboul made their rule doubly hateful. Numbers of the peasantry emigrated, and the population rapidly diminished. In 1745 the number of tax-paying families, which a few years before had amounted to 147,000, had sunk to 70,000. Yet the taxes were continually on the increase, and the hospodar Scarlati Ghika (1758-61), though he tried to win some popularity by the removal of Turkish settlers and the abolition of the "vakarit," or tax on cattle and horses, which was peculiarly hateful to the peasantry, raised the total amount of taxation to 25,000,000 lion-dollars. The Turks meantime maintained their iron grip on the country by holding on the Walachian bank of the Danube the fortresses of Giurgevo, Turnul, and Orsova, with the surrounding districts.

But the tide of Ottoman dominion was ebbing fast. Already, by the peace of Passarowitz (Pojarevatz) in 1718, the banat of Krajova had been ceded to the emperor, though by the peace of Belgrade in 1739 it was recovered by the Porte for its Walachian vassal. In 1769 the Russian general Romanzoff occupied the principality, the bishops and clergy took an oath of fidelity to the empress Catherine, and a deputation of boiars followed. The liberties of the country were guaranteed, taxation reformed, and in 1772 the negotiations at Fokshani between Russia and the Porte broke down because the czarina's representatives insisted on the sultan's recognition of the independence of Walachia and Moldavia under an European guarantee. By the treaty of Kutshuk Kainardji, concluded in 1774, Russia consented to hand back the principalities to the Kutshuk sultan, but by Art. xvi. several stipulations were made in favour Kainardji. The people of the principalities were to enjoy all the privileges that they had possessed under Mahomet IV.; they were to be freed from tribute for two years, as some compensation for the ruinous effects of the last war; they were to pay a moderate tribute; the agents of Walachia and Moldavia at Constantinople were to enjoy the rights of nations, and the Russian minister at the Porte should on occasion watch over the interests of the principalities. The stipulations of the treaty of Kutshuk Kainardji, though deficient in precision (the Walachians, for instance, had no authentic record of the privileges enjoyed under Mahomet IV.), formed the basis of the future liberties in both principalities; and, as from this period onwards Walachian history is closely connected with that of Moldavia, it may be convenient before continuing this review to turn to the earlier history of the sister principality.

Moldavia.—The mention of Vlachs on the borders of Galicia in Early 1160 (Nic. Chon., p. 171) gives just ground for believing that a Mol-Rouman population existed in Moldavia at least as early as the first half of the 12th century. Under the successive domination, however, of Petchenegs, Cumans, and Tatars, it occupied as yet a subordinate position. It was not till 1352 that the Tatars, already weakened by Polish assaults on the Podolian side, were expelled from this Cumanian region by the Transylvanian voivode Andreas Laszkovich. It is in fact to the period immediately succeeding this event that the first establishment of an independent Rouman state in Moldavia is referred by the concurrent testimony of Moldavian, Russian, and Hungarian sources.

According to the native traditional account, as first given by the Moldavian chroniclers of the 17th and 18th centuries (Grigorie Urechie and Miron Costin), Dragosh the son of Bogdan, the founder of the new principality, emigrated with his followers towards the end of the 14th century from the Hungarian district of Marmaros in the North Carpathians. The story is related with various fabulous accompaniments. From the aurochs (*zimbru*), in pursuit of which Dragosh first arrived on the banks of the Molda, is derived the ox-head of the Moldavian national arms, and from his favourite hound who perished in the waters the name of the river. From the Hungarian and Russian sources, which are somewhat more precise, the date of the arrival of Dragosh, who otherwise appears as Bogdan, in Moldavia appears to have been 1359, and his departure from Marmaros was carried out in defiance of his Hungarian suzerain.

In the agreement arrived at between King Louis of Hungary and Rival the emperor Charles IV. in 1372, the voivodate of Moldavia was claims of recognized as a dependency of the crown of St Stephen. The over-Poland lordship over the country was, however, contested by the king of Poland, and their rival claims were a continual source of dispute between the two kingdoms. In 1412 a remarkable agreement was arrived at between Sigismund, in his quality of king of Hungary, and King Jagieffo of Poland, by which both parties consented to postpone the question of suzerainship in Moldavia. Should, however, the Turks invade the country, the Polish and Hungarian forces were to unite in expelling them, the voivode was to be deposed, and the Moldavian territories divided between the allies. During the first half of the 15th century Polish influence was preponderant, and it was customary for the voivodes of Moldavia to do homage to the king of Poland at Kameniec or Snyatin.

In 1456 the voivode Peter, alarmed at the progress of the Turks,

Stephen the Great. who were now dominant in Servia and Walachia, offered Sultan Mahomet a yearly tribute of 2000 ducats. On his deposition, however, in 1458 by Stephen, known as "the Great," Moldavia became a power formidable alike to Turk, Pole, and Hungarian. Throughout the long reign of this voivode, which lasted forty-six years, from 1458 to 1504, his courage and resources never failed him. In the early part of his reign he appears, in agreement with the Turkish sultan and the king of Poland, turning out the Hungarian vassal, the ferocious Vlad, from the Walachian throne, and annexing the coast cities of Kilia and Cetatea Alba or Bielogorod, the Turkish Akierman. In the autumn of 1474 the sultan Mahomet entered Moldavia at the head of an army estimated by the Polish historian Dlugoss at 120,000 men. Voivode Stephen withdrew into the interior at the approach of this overwhelming host, but on January 17, 1475, turned at bay on the banks of Lake Rakovietz and gained a complete victory over the Turks. Four pashas were among the slain; over a hundred banners fell into the Moldavian hands; and only a few survivors succeeded in reaching the Danube. In 1476 Mahomet again entered Moldavia, thirsting for vengeance, but, though successful in the open field, the Turks were sorely harassed by Stephen's guerilla onslaughts, and, being thinned by pestilence, were again constrained to retire. In 1484 the same tactics proved successful against an invasion of Bajazet. Three years later a Polish invasion of Moldavia under John Albert with 80,000 men ended in disaster, and shortly afterwards the voivode Stephen, aided by a Turkish and Tatar contingent, laid waste the Polish territories to the upper waters of the Vistula, and succeeded in annexing for a time the Polish province of Pokutia that lay between the Carpathians and the Dniester.

Moldavia circ. 1500. Exclusive of this temporary acquisition, the Moldavian territory at this period extended from the river Milcov, which formed the boundary of Walachia, to the Dniester. It included the Carpathian region of the Bukovina, literally "the beechwood," where lay Sereth and Suciava, the earliest residences of the voivodes, the maritime district of Budzak (the later Bessarabia), with Kilia and Bielogorod, and the left bank of the lower Danube from Galatz to the Sulina mouth. The government, civil and ecclesiastical, was practically the same as that described in the case of Walachia, the officials bearing for the most part Slavonic titles derived from the practice of the Bulgaro-Vlachian czardom. The church was Orthodox Oriental, and depended from the patriarch of Ohrida. In official documents the language used was the old Slovene, the style of a Moldavian ruler being *Natchalnik i Voievoda Moldovlasi*, prince and duke (= Germ. "Fürst" and "Herzog") of the Moldovlachs. The election of the voivodes, though in the hands of the boiars, was strictly regulated by hereditary principles, and Cantemir describes the extinction of the house of Dragosh in the 16th century as one of the unsettling causes that most contributed to the ruin of the country. The Moldavian army was reckoned 40,000 strong, and the cavalry arm was especially formidable. Verantius of Sebenico, an eye-witness of the state of Moldavia at the beginning of the 16th century, mentions three towns of the interior provided with stone walls—Suciava, Chotim, and Njamtz; the people were barbarous, but more warlike than the Walachians and more tenacious of their national costume, punishing with death any who adopted the Turkish.

Moldavia tributary to the Turks. In 1504 Stephen the Great died, and was succeeded by his son, Bogdan "the One-eyed." At feud with Poland about Pokutia, despairing of efficacious support from hard-pressed Hungary, the new voivode saw no hope of safety except in a dependent alliance with the advancing Ottoman Power, which already hemmed Moldavia in on the Walachian and Crimean sides. In 1513 he agreed to pay an annual tribute to Sultan Selim in return for the sultan's guarantee to preserve the national constitution and religion of Moldavia, to which country the Turks now gave the name of Kara Bogdan, from their first vassal. The terms of Moldavian submission were further regulated by a firman signed by Sultan Suleiman at Buda in 1529 by which the yearly present or "backshish," as the tribute was euphoniouly called, was fixed at 4000 ducats, 40 horses, and 25 falcons, and the voivode was bound at need to supply the Turkish army with a contingent of a thousand men. The Turks pursued much the same policy as in Walachia. The tribute was gradually increased. A hold was obtained on the country by the occupation of various strongholds on Moldavian soil with the surrounding territory,—in 1538 Cetatea Alba (Akierman), in 1592 Bender, in 1702 Chotim (Khotin). Already by the middle of the 16th century the yoke was so heavy that the voivode Elias (1546-1551) became Mohammedan to avoid the sultan's anger.

The impostor Jacob Basilicus. At this period occurs a curious interlude in Moldavian history. In 1561 the adventurer and impostor Jacob Basilicus succeeded with Hungarian help in turning out the voivode Alexander and seizing on the reins of government. A Greek by birth, adopted son of Jacob Heraklides, despot of Paros, Samos, and other Ægean islands, acquainted with Greek and Latin literature, and master of most European languages, appearing alternately as a student of astronomy at Wittenberg, whither he had been invited by Count Mansfeld, as a correspondent of Melanchthon and as a writer of

historical works which he dedicated to Philip II. of Spain, Basilicus, finding that his Ægean sovereignty *in partibus* was of little practical value beyond the crowning of poet laureates, fixed his roving ambition on a more substantial dominion. He published an astounding pedigree, in which, starting from "Hercules Triptolemus" he wound his way through the royal Servian line to the kinship of Moldavian voivodes, and, having won the emperor Ferdinand and Albert Lasky to his financial and military support, succeeded, though at the head of only 1600 cavalry, in routing by a bold dash the vastly superior forces of the voivode, and even in purchasing the Turkish confirmation of his usurped title. He assumed the style of *Βασιλεὺς Μολδαβίας*, and eluded the Turkish stipulation that he should dismiss his foreign guards. In Moldavia he appeared as a moral reformer, endeavouring to put down the prevalent vices of bigamy and divorce. He erected a school, placed it under a German master, and collected children from every part of the country to be maintained and educated at his expense. He also busied himself with the collection of a library. But his taxes—a ducat for each family—were considered heavy; his orthodoxy was suspected, his foreign counsellors detested. In 1563 the people rose, massacred the Hungarian guards, the foreign settlers, and finally Jacob himself.

The expelled voivode Alexander was now restored by the Porte, the schools were destroyed, and the country relapsed into its normal state of barbarism. His successor Iyonia was provoked by the Porte's demand for 120,000 ducats as tribute instead of 60,000 as heretofore to rise against the oppressor, but after gaining three victories he was finally defeated and slain (1574), and the country was left more than ever at the mercy of the Ottoman. Voivodes were now created and deposed in rapid succession by the Divan, but the victories of Michael the Brave in Walachia infused a more independent spirit into the Moldavians. The Moldavian dominion was now disputed by the Transylvanians and Poles, and in 1600 Michael succeeded in annexing it to his "Great Dacian" realm. On Michael's murder the Poles under Zamoyski again asserted their supremacy, but in 1618 the Porte once more recovered its dominion and set up successively two creatures of its own as voivodes—Gratiani, an Italian who had been court jeweller, and a Greek custom-house official, Alexander.

As in Walachia at a somewhat later date the Fanariote regime The seemed now thoroughly established in Moldavia, and it became the Fanariote rule that every three years the voivode should procure his confirmation by a large backshish, and every year by a smaller one. The prince Vasilje Lupul, however, an Albanian, who succeeded in 1634, showed great abilities, and for twenty years succeeded in maintaining his position on the Moldavian throne. He introduced several internal reforms, codified the written and unwritten laws of the country, established a printing press, Greek monastic schools, and also a Latin school. He brought the Moldavian Church into more direct relation with the patriarch of Constantinople, but also showed considerable favour to the Latins, allowing them to erect churches at Suciava, Jassy, and Galatz.

During the wars between Sobieski and the Turks Moldavia found itself between hammer and anvil, and suffered frightfully moreover from Tatar devastations. The voivode Duka was forced like his Walachian contemporary to supply a contingent for the siege of Vienna in 1683. After Sobieski's death in 1696, the hopes of Moldavia turned to the advancing Muscovite power. In 1711 the voivode Demetriu Cantemir, rendered desperate by the Turkish Demetria exactions, concluded an agreement with the czar Peter by which Cantemir. Moldavia was to become a protected and vassal state of Russia, with the enjoyment of its traditional liberties, the voivodeship to be hereditary in the family of Cantemir. On the approach of the Russian army the prince issued a proclamation containing the terms of the Russian protectorate and calling on the boiars and people to aid their Orthodox deliverers. But the iron had entered into the people's soul. The long Turkish terrorism had done its work, and at the approach of a Turkish and Tatar host the greater part of the Moldavians deserted their voivode. The Russian campaign was unsuccessful, and all that Czar Peter could offer Cantemir and the boiars who had stood by him was an asylum on Russian soil.

In his Russian exile Cantemir composed in a fair Latin style Cante-his *Descriptio Moldaviæ*, the counterpart so far as Moldavia is mir's concerned to Del Chiaro's contemporary description of Walachia. The capital of the country was now Jassy, to which city Stephen the Great had transferred his court from Suciava, the earlier residence of the voivodes. It had at this time forty churches—some of stone, some of wood. Fifty years before it had contained 12,000 houses, but Tatar devastations had reduced it to a third of its former size. The most important commercial emporium was the Danubian port of Galatz, which was frequented by vessels from the whole of the Levant from Trebizond to Barbary. The cargoes which they here took in consisted of Moldavian timber (oak, deal, and cornel), grain, butter, honey and wax, salt, and nitre; Kilia at the north mouth of the Danube was also frequented by trading vessels, including Venetian and Ragusan. Moldavian wine was exported to Poland, Russia, Transylvania, and Hungary; that of Cotnar was

in Cantemir's opinion superior to Tokay. The excellence of the Moldavian horses is attested by a Turkish proverb; and annual droves of as many as 40,000 Moldavian oxen were sent across Poland to Dantzic. Moldavia proper was divided into the upper country or *T'erra de sus*, and the lower country, or *T'erra de josu*. Bessarabia had been detached from the rest of the principality and placed under the direct control of the seraskier. It was divided into four provinces:—that of Budzak, inhabited by the Nogai Tatars; that of Akierman or Cetatea Alba, the Greek Monkastron, a strongly fortified place; and those of Ismaila and Kilia. The voivodes owed their nomination entirely to the Porte, and the great officers of the realm were appointed at their discretion. These were the Great Logothete (*Marele Logofetu*) or chancellor; the governor of Lower Moldavia—*Vorniculul de l'erra de josu*; the governor of Upper Moldavia—*Vorniculul de l'erra de sus*; the *Haiman* or commander in chief; the high chamberlain—*Marele Postelnicu*; the great *Spathar*, or swordbearer; the great cupbearer—*Marele Paharnicu*; and the treasurer, or *Vistiernicu*, who together formed the prince's council and were known as *Boiari de Svatu*. Below these were a number of subordinate officers who acted as their assessors and were known as boiars of the Divan (*Boiari de Divanu*). The high court of justice was formed by the prince, metropolitan, and boiars: the *Boiari de Svatu* decided on the verdict; the metropolitan declared the law; and the prince pronounced sentence. The boiars were able to try minor cases in their own residences, but subject to the right of appeal to the prince's tribunal. Of the character of the Moldavian people Cantemir does not give a very favourable account. Their best points were their hospitality and, in Lower Moldavia, their valour. They cared little for letters and were generally indolent, and their prejudice against mercantile pursuits left the commerce of the country in the hands of Armenians, Jews, Greeks, and Turks. The pure-blood Rouman population, noble and plebeian, inhabited the cities and towns or larger villages; the peasantry were mostly of Little Russian and Hungarian race and were in a servile condition. There was a considerable Gipsy population, almost every boiar having several Zingar families in his possession; these were mostly smiths.

Officers
of state.

Continuation
of
Fanariote
regime.

From this period onwards the character of the Ottoman domination in Moldavia is in every respect analogous to that of Walachia. The office of voivode or hospodar was farmed out by the Porte to a succession of wealthy Greeks from the Fanar quarter of Constantinople. All formality of election by the boiars was now dispensed with, and the princes received their caftan of office at Constantinople, where they were consecrated by the Greek patriarch. The system favoured Turkish extortion in two ways: the presence of the voivode's family connexions at Stamboul gave the Porte so many hostages for his obedience; on the other hand the princes themselves could not rely on any support due to family influence in Moldavia itself. They were thus mere puppets of the Divan, and could be deposed and shifted with the same facility as so many pashas—an object of Turkish policy, as each change was a pretext for a new levy of "backshish." The chief families that shared the office during this period were those of Mavrocordato, Ghika, Callimachi, Ypsilanti, and Murusi. Although from the very conditions of their creation they regarded the country as a field for exploitations, they were themselves often men of education and ability, and unquestionably made some praiseworthy attempts to promote the general culture and wellbeing of their subjects. In this respect, even the Fanariote regime was preferable to mere pasha rule, while it had the further consequence of preserving intact the national form of administration and the historic offices of Moldavia. Gregory Ghika (1774-1777), who himself spoke French and Italian, founded a school or "gymnasium" at Jassy, where Greek, Latin, and theology were taught in a fashion. He encouraged the settlement of German protestant colonists in the country, some of whom set up as watchmakers in Jassy, where they were further allowed to build an evangelical church. Carra, a Swiss who had been tutor to Prince Ghika's children, and who published in 1781 an account of the actual state of the principalities, speaks of some of the boiars as possessing a taste for French literature and even for the works of Voltaire, a tendency actively combated by the patriarch of Constantinople.

Cession
of Buko-
vina.

The Russo-Turkish War, which ended in the peace of Kutshuk Kaimardji, was fatal to the integrity of Moldavian territory. The house of Austria, which had already annexed Galicia in 1772, profited by the situation to arrange with both contending parties for the peaceful cession of the Bukovina to the Hapsburg monarchy. This richly-wooded Moldavian province, containing Suciava, the earliest seat of the voivodes, and Cernauti or Czernovitz, was in 1774 occupied by Hapsburg troops with Russian connivance, and in 1777 Baron Thugut procured its formal cession from the sultan. The Bukovina is still an Austrian province.

Russian
protec-
tion.

Walachian and Moldavian History from the Treaty of Kutshuk Kaimardji in 1774 to the Establishment of the Roumanian Kingdom.—The treaty of Kutshuk Kaimardji was hardly concluded when it was violated by the Porte, which refused to recognize the right of the Walachian boiars to elect their voivode, and nominated

Alexander Ypsilanti, a creature of its own. In 1777 Constantine Murusi was made voivode of Moldavia in the same high-handed fashion. The Divan seemed intent on restoring the old system of government in its entirety, but in 1783 the Russian representative extracted from the sultan a hattisherif defining more precisely the liberties of the principalities and fixing the amount of the annual tribute—for Walachia 619 purses exclusive of the bairam and other presents amounting to 130,000 piasters, and for Moldavia 135 purses and further gifts to the extent of 115,000 piasters. By the peace of Jassy in 1792 the Dniester was recognized as the Russian frontier, and the privileges of the principalities as specified in the hattisherif confirmed. In defiance of treaties, however, the Porte continued to change the hospodars almost yearly and to exact extraordinary installation presents. The revolt of Pasvan Oglu in Bulgaria was the cause of great injury to Walachia. The rebels ravaged Little Walachia in 1801-2, and their ravages were succeeded by those of the Turkish troops, who now swarmed over the country. Exaction followed exaction, and in 1802 Russia resolved to assert her treaty rights in favour of the oppressed inhabitants of the principalities. On the accession of Constantine Ypsilanti the Porte was constrained to issue a new hattisherif by which every prince was to hold his office for at least seven years, unless the Porte satisfied the Russian minister that there were good and sufficient grounds for his deposition. All irregular contributions were to cease, and all citizens, with the exception of the boiars and clergy, were to pay their share of the tribute. The Turkish troops then employed in the principalities were to be paid off, and one year's tribute remitted for the purpose. The boiars were to be responsible for the maintenance of schools, hospitals, and roads; they and the prince together for the militia. The number of Turkish merchants resident in the country was limited. Finally, the hospodars were to be amenable to representations made to them by the Russian envoy at Constantinople, to whom was entrusted the task of watching over the Walachian and Moldavian liberties. This, it will be seen, was a veiled Russian protectorate.

In 1804 the Serbs under Karageorge rose against the Turkish dominion, and were secretly aided by the Walachian voivode Ypsilanti. The Porte, instigated by Napoleon's ambassador Sebastiani, resolved on Ypsilanti's deposition, but the hospodar succeeded in escaping to St Petersburg. In the war that now ensued between the Russians and the Turks, the former were for a time successful, and even demanded that the Russian territory should extend to the Danube. In 1808 the Russians, then in occupation of the principalities, formed a governing committee consisting of the metropolitan, another bishop, and four or five boiars under the presidency of General Kusunoff. The seat of the president was at Jassy, and General Engelhart was appointed as vice-president at Bucharest. By the peace of Bucharest, however, in 1812, the principalities were restored to the sultan under the former conditions, with the exception of Bessarabia, which was ceded to the czar. The Pruth thus became the Russian boundary.

The growing solidarity between the two Rouman principalities "Hetær-received a striking illustration in 1816, when the Walachian and ist" Moldavian hospodars published together a code applicable to both move- countries, and which had been elaborated by a joint commission. ment. The Greek movement was now beginning, and in 1821 Alexander Ypsilanti entered Moldavia at the head of the Hetærists, and prevailed on the hospodar Michael Sutzu to aid him in invading the Ottoman dominions. To secure Walachian help, Ypsilanti advanced on Bucharest, but the prince, Theodore Vladimirescu, who represented the national Rouman reaction against the Fanariotes, repulsed his overtures with the remark "that his business was not to march against the Turks, but to clear the country of Fanariotes." Vladimirescu was slain by a Greek revolutionary agent, but Ypsilanti's legion was totally routed by the Turks at Drăgășani, and the result of his enterprise was a Turkish occupation of the principalities. In 1822 the Turkish troops, who had committed great excesses, were withdrawn on the combined representations of Russia, Austria, and Great Britain. The country, however, was again ravaged by the retiring troops, quarters of Jassy and Bucharest burnt, and the complete evacuation delayed till 1824, when the British Government again remonstrated with the Porte. By the convention of Akierman between the Russians and the Turks in 1826 the privileges of the principalities were once more confirmed, and they were again ratified in 1829, under Russian guarantee, by the peace of Adrianople. By this peace all the towns on the left bank of the Danube were restored to the principalities, and the Porte undertook to refrain from fortifying any position on the Walachian ope, side of the river. The principalities were to enjoy commercial free- 1829. dom, and the right of establishing a quarantine cordon along the Danube or elsewhere. The internal constitution of the countries was to be regulated by an "Organic Law," which was drawn up by assemblies of bishops and boiars at Jassy and Bucharest, acting, however, under Russian control. The Organic Law thus elaborated was by no means of a liberal character, and amongst other abuses maintained the feudal privileges of the boiars. It was ratified by the Porte in 1834, and the Russian army of occupation thereupon withdrew.

Move-
ment of
1848.

The revolutionary movement of 1848 extended from the Roumans of Hungary and Transylvania to their kinsmen of the Transalpine regions. In Moldavia the agitation was mostly confined to the boiars, and the hospodar Michael Sturdza succeeded in arresting the ringleaders. In Walachia, however, the outbreak took a more violent form. The people assembled at Bucharest, and demanded a constitution. The prince Bibescu, after setting his signature to the constitution submitted to him, fled to Transylvania, and a provisional government was formed. The Turks, however, urged thereto by Russian diplomacy, crossed the Danube, and a joint Russo-Turkish dictatorship restored the "Organic Law." By the Balta-Liman convention of 1849 the two Governments agreed to the appointment of Barbu Stürbeiu as prince of Walachia, and Gregoriu Ghika for Moldavia.

Russian
and
Austrian
occupa-
tion,
1853-54.

On the entry of the Russian troops into the principalities in 1853, the hospodars fled to Vienna, leaving the government in the hands of their ministers. During the Danubian campaign that now ensued great suffering was inflicted on the inhabitants, but in 1854 the cabinet of Vienna induced the Russians to withdraw. Austrian troops occupied the principalities, and the hospodars returned to their posts.

Treaty of
Paris,
1856.

By the treaty of Paris in 1856 the principalities with their existing privileges were placed under the collective guarantee of the contracting powers, while remaining under the suzerainty of the Porte,—the Porte on its part engaging to respect the complete independence of their internal administration. A strip of southern Bessarabia was restored to Moldavia, so as to push back the Russian frontier from the Danube mouth. The existing laws and statutes of both principalities were to be revised by a European commission sitting at Bucharest, and their work was to be assisted by a Divan or national council which the Porte was to convoke *ad hoc* in each of the two provinces, and in which all classes of Walachian and Moldavian society were to be represented. The European commission, in arriving at its conclusions, was to take into consideration the opinion expressed by the representative councils; the Powers were to come to terms with the Porte as to the recommendations of the commission, and the final result was to be embodied in a hattisherif of the sultan, which was to lay down the definitive organization of the two principalities. In 1857 the commission arrived, and the representative councils of the two peoples were convoked. On their meeting in September they at once proceeded to vote with unanimity the union of the two principalities into a single state under the name of Romania (Roumania), to be governed by a foreign prince elected from one of the reigning dynasties of Europe, and having a single representative assembly. The Powers decided to undo the work of national union. By the convention concluded by the European congress at Paris in 1858, it was decided that the principalities should continue as heretofore to be governed each by its own prince. Walachia and Moldavia were to have separate assemblies, but a central commission was to be established at Fokshani for the preparation of laws of common interest, which were afterwards to be submitted to the respective assemblies. In accordance with this convention the deputies of Moldavia and Walachia met in separate assemblies at Bucharest and Jassy, but the choice of both fell unanimously on Prince Alexander John Cuza, thus ensuring the personal union of the two principalities (January 1859). A new conference was now summoned to Paris to discuss the affairs of the principalities, and the election of Prince Cuza finally ratified by the Powers and the Porte. The two assemblies and the central commission were preserved till 1862, when a single assembly met at Bucharest and a single ministry was formed for the two countries. The central commission was at the same time abolished, and a council of state charged with preparing bills substituted for it. In May 1864, owing to difficulties between the Government and the general assembly, the latter was dissolved, and a statute was submitted to universal suffrage giving greater authority to the prince, and creating two chambers (of senators and of deputies). The franchise was now extended to all citizens, a cumulative voting power being reserved, however, for property, and the peasantry were emancipated from forced labour.

Union of
the two
princi-
palities
pro-
claimed.

On their meeting in September they at once proceeded to vote with unanimity the union of the two principalities into a single state under the name of Romania (Roumania), to be governed by a foreign prince elected from one of the reigning dynasties of Europe, and having a single representative assembly. The Powers decided to undo the work of national union. By the convention concluded by the European congress at Paris in 1858, it was decided that the principalities should continue as heretofore to be governed each by its own prince. Walachia and Moldavia were to have separate assemblies, but a central commission was to be established at Fokshani for the preparation of laws of common interest, which were afterwards to be submitted to the respective assemblies. In accordance with this convention the deputies of Moldavia and Walachia met in separate assemblies at Bucharest and Jassy, but the choice of both fell unanimously on Prince Alexander John Cuza, thus ensuring the personal union of the two principalities (January 1859). A new conference was now summoned to Paris to discuss the affairs of the principalities, and the election of Prince Cuza finally ratified by the Powers and the Porte. The two assemblies and the central commission were preserved till 1862, when a single assembly met at Bucharest and a single ministry was formed for the two countries. The central commission was at the same time abolished, and a council of state charged with preparing bills substituted for it. In May 1864, owing to difficulties between the Government and the general assembly, the latter was dissolved, and a statute was submitted to universal suffrage giving greater authority to the prince, and creating two chambers (of senators and of deputies). The franchise was now extended to all citizens, a cumulative voting power being reserved, however, for property, and the peasantry were emancipated from forced labour.

Attempt
to dis-
unite
them.

In 1865 a conflict broke out between the Government and the people in Bucharest, and in February 1866 Prince Cuza, whose personal vices had rendered him detestable, was forced to abdicate. The chambers chose first as his successor the count of Flanders, but on his declining the office proceeded to elect Prince Charles of Hohenzollern-Sigmaringen, who was proclaimed hospodar or *Domnu* of Roumania April 29, 1866. A new constitution was at the same time introduced. Its provisions secure the universal suffrage of tax-paying citizens, ministerial responsibility, trial by jury, freedom of meeting and petition, of speech and of the press (except as regards breaches of the criminal code), gratuitous and compulsory primary education, and the right of asylum for political exiles. Legislative power is shared between the prince and chambers, but bills relating to the budget and army must originate with the chamber of deputies. There are two chambers—the senate and the chamber of deputies. Both houses are elective, and the election is carried out by means of electoral colleges classified

It fails.

In 1865 a conflict broke out between the Government and the people in Bucharest, and in February 1866 Prince Cuza, whose personal vices had rendered him detestable, was forced to abdicate. The chambers chose first as his successor the count of Flanders, but on his declining the office proceeded to elect Prince Charles of Hohenzollern-Sigmaringen, who was proclaimed hospodar or *Domnu* of Roumania April 29, 1866. A new constitution was at the same time introduced. Its provisions secure the universal suffrage of tax-paying citizens, ministerial responsibility, trial by jury, freedom of meeting and petition, of speech and of the press (except as regards breaches of the criminal code), gratuitous and compulsory primary education, and the right of asylum for political exiles. Legislative power is shared between the prince and chambers, but bills relating to the budget and army must originate with the chamber of deputies. There are two chambers—the senate and the chamber of deputies. Both houses are elective, and the election is carried out by means of electoral colleges classified

according to property and professional qualifications. For the house of deputies each constituency is divided in this way into four colleges, each of which elects a member. The two highest of these colleges also elect the senators, each senator being elected for a term of eight years. The senate also includes *ex officio* certain high officials and ecclesiastics, and members for the universities. The senate consists at present of 120 members, the chamber of deputies of 178. The sovereign has a right of veto reserved to him on all measures. The judicial system is based on the *Code Napoléon*, with some modifications.

On the outbreak of the Russo-Turkish war in 1877 Roumania found herself once more between hammer and anvil. Yielding to *force majeure* the Government of Prince Charles consented to the Turkish passage of Russian troops across Roumanian territory, on the understanding that the scene of hostilities was as far as possible to be removed outside the limits of the principality. The Porte, however, refusing to recognize that Roumania had acted under constraint, proclaimed the Roumanians rebels, and the prince's Government accordingly resolved to offer active assistance to the Russians. A Roumanian division of 32,000 men under General Rou-Cernat, took part in the siege of Plevna, and the Roumanian manian soldiers distinguished themselves in the opinion of the most com-petent judges alike for their heroism and endurance. The successful Plevna assault by the Roumanian troops on the "indomitable redoubt" of Grivitzia formed in fact the turning point of the siege and of the war. In the peace of St Stefano, however, Russia insisted on the retrocession of the strip of Bessarabia that had been restored to Moldavia by the treaty of Paris, giving Roumania "in exchange" the islands of the Danubian delta, and the Dobrudja, which had been ceded by the sultan. This territorial readjustment was ratified by the treaty Berlin of Berlin (1878). The high contracting powers at the same time treaty consented by Art. xliii. to recognize the independence of the principality subject to the provision (Art. xlii.) that all the inhabitants should enjoy complete religious freedom, a clause inserted on account of the Jewish persecutions that had previously taken place, and that foreigners in the country should be treated on a footing of perfect equality. All Danubian fortresses were to be razed, and the jurisdiction of the European commission to regulate the Danubian navigation, on which Roumania now acquired the right of representation, was extended from the mouth to the Iron Gates. The coping-stone to Roumanian independence was set by the proclama- tion on March 26, 1881, of Prince Charles as king of Roumania, Charles and on May 22 of the same year his coronation took place with the crowned European sanction. The crown placed on King Carol's head was king made from the captured cannon of the Plevna redoubts.

Authorities.—As the questions regarding the first appearance of the Roumans north of the Danube are reserved for the article VLACHS, it may be sufficient here to refer the reader to the works of Roesler, especially *Romanische Studien*; J. Jung, *Anfänge der Rumänen*, and Roemer und Rumänen; Lad. Pič, *Abstammung der Rumänen*; A. D. Xenopol, *Les Roumains au Moyen Âge*. For the history of the principalities down to the end of the last century J. C. Engel's works, *Die Geschichte der Walachei und Geschichte der Moldau*, are still the most trustworthy authorities. J. A. Vaillant, *La Roumanie. Histoire, Langue, &c.*, and A. T. Laurianu, *Istoria Romaniloru*, &c., may be consulted for the later history, but a really critical history of the principalities has yet to be written. The materials for it are, however, being rapidly amassed—thanks to the publications of the Roumanian Academy and the documents collected by native scholars; cf. especially Hurmuzaki, *Documente privitoare la Istoria Romanilor*, and Hasdeu, *Publicațiuni istorico-filologice*, &c. For a useful account of the present state of Roumania, see James Samuelson, *Roumania Past and Present*, 1892. For views of Walachia and Moldavia, as they existed from the 15th century onwards, reference has already been made to the works of Verantius and Del Chiaro, and Cantemir's *Descriptio Moldaviae*. (A. J. E.)

ROUMANIAN LANGUAGE. See VLACHS.

ROUMELIA. The name of Roumili, "the land of the Romans," was applied from the 15th century downwards to all that portion of the Balkan peninsula westwards from the Black Sea which was subject to Turkey. More precisely it was the country bounded N. by Bulgaria, W. by Albania, and S. by the Morea, or in other words the ancient provinces, including Constantinople and Salonica, of Thrace, Thessaly, and Macedonia. The name was ultimately applied more especially to an eyalet or province composed of Central Albania and Western Macedonia, having Monastir for its chief town and including Kesrie (Castoria), Ocri (Ochrida), and Scodra (Scutari); and at length it disappeared altogether in the administrative alterations effected between 1870 and 1875. Eastern Roumelia was constituted an autonomous province of the Turkish empire by the Berlin treaty of 1878, to be governed by a Christian governor-general appointed by the sultan for a term of five years. In 1879, in obedience to an international commission, it was divided into six departments and twenty-eight cantons, the departments being Philippopolis (187,095), Tatarbazarjik (117,063),

Hasskői (134,268), Eski-Zagra (158,905) Kazanlik, Slivno or Sliven (130,136), and Burgas (88,046). On the N. and N.W. East Roumelia was bounded by Bulgaria, the frontier running along the line of the Balkans though not keeping to the watershed; on the S.W. and S. lay the vilayets of Salonika and Adrianople, the borderlands forming part of the Rhodope or Despoto mountain system. The direct distance between the northmost and southmost point on the Black Sea is only 40 miles, but the actual coast-line is lengthened by the ramifications of the Bay of Burgas, which is the only part of the Black Sea affording several good anchorages. The great bulk of the country belongs to the basin of the Maritza and its tributary the Tunja (confluence at Adrianople, to the south of Roumelia), though a certain part drains north-eastwards by several small streams. The whole area is estimated at 14,858 square miles, and the population in 1880 was 815,513, of whom 573,231 were Bulgarians, 176,759 Turks, 42,526 Greeks, 19,524 Gipsies, 4177 Jews, and 1306 Armenians. This preponderance of Bulgarians led in September 1885 to the Philippopolis revolution, which resulted in the principality of Bulgaria declaring East Roumelia part and parcel of United Bulgaria; and the United Bulgarians have since been successful in a war with the Servians, who invaded their territory.

ROUND TOWERS. A peculiar class of round tower exists scattered throughout Ireland; about one hundred and twenty examples once existed; most of these are ruined, but eighteen or twenty are almost perfect. These towers were built either near or adjoining a church; they are of various dates from perhaps the 8th to the 13th century; though varying in size and detail, they have many characteristics which are common to all. They are built with walls slightly battering inwards, so that the tower tapers towards the top. The lower part is formed of solid masonry, the one doorway being raised from 6 to 20 feet above the ground, and so only accessible by means of a ladder. The towers within are divided into several stories by two or more floors, usually of wood, but in some cases, as at Keneith, of stone slightly arched. The access from floor to floor was by ladders, no stone staircase being provided. The windows, which are always high up, are single lights, mostly arched or with a flat stone lintel. In some of the oldest towers they have triangular tops, formed by two stones leaning together, like the windows at Deerhurst and other pre-Norman buildings in England. One peculiarity of the door and window openings in the Irish round towers is that the jambs are frequently set sloping, so that the opening grows narrower towards the top, as in the temples of ancient Egypt. The later examples of these towers, dating from the 12th and 13th centuries are often decorated with chevron, billet, and other Norman enrichments round the jambs and arches. The roof is of stone, usually conical in shape, and some of the later towers are crowned by a circle of battlements. The height of the round towers varies from about 60 feet to 132; that at Kilcullen was the highest. The masonry differs according to its date,—the oldest examples being built of almost uncut rubble work, and the later ones of neatly-jointed ashlar.

Much has been written as to the use of these towers, and the most conflicting theories as to their origin have been propounded. It is, however, fairly certain that they were constructed by Christian builders, both from the fact that they always are or once were near to a church, and also because crosses and other Christian emblems frequently occur among the sculptured decorations of their doors and windows. The original purpose of these towers was probably for places of refuge, for which the solid base and the door high above the ground seem specially adapted. They

may also have been watch-towers, and in later times often contained bells. Their circular form was probably for the sake of strength, angles which could be attacked by a battering ram being thus avoided, and also because no quoins or dressed stones were needed, except for the openings—an important point at a time when tools for working stone were scarce and imperfect. Both these reasons may also account for the Norman round towers which are so common at the west end of churches in Norfolk, Suffolk, and Essex, though these have little resemblance to those of Ireland except in the use of a circular plan. One example exactly like those of Ireland still exists in the Isle of Man, within the precincts of Peel Castle adjacent to the cathedral of St German; it was probably the work of Irish builders. There are also three in Scotland, viz. at Egilshay in Orkney, and at Abernethy and Brechin.

Round towers wider and lower in proportion than those of Ireland appear to have been built by many prehistoric races at different parts of Europe. Many examples exist in Scotland, and in the islands of Corsica and Sardinia. The towers of this class in Scotland are called "brochs"; they average about 50 feet high and 30 feet in internal diameter. Their walls, which are usually about 15 feet thick at the bottom, are built hollow, of rubble masonry, with series of passages one over the other running all round the tower. As in the Irish towers, the entrance is placed at some distance from the ground; and the whole structure is designed as a stronghold. The brochs appear to have been the work of a pre-Christian Celtic race. Many objects in bronze and iron and fragments of hand-made pottery have been found in and near these towers, all bearing witness of a very early date. See Anderson, *Scotland in Pagan Times*, 1883, and *Scotland in Early Christian Times*, 1881. During the 6th century church towers at and near Ravenna were usually built round in plan, and not unlike those of Ireland in their proportions. The finest existing example is that which stands by the church of S. Apollinare in Classe, the old port of the city of Ravenna (see *BASILICA*, vol. iii. p. 415, fig. 5). It is of brick, divided into nine stories, with single-light windows below, three-light windows in the upper stories, and two-lights in the intermediate ones. The most magnificent example of a round tower is the well-known leaning tower of Pisa, begun in the year 1174. It is richly decorated with tiers of open marble arcades, supported on free columns. The circular plan was much used by Moslem races for their minarets. The finest of these is the 13th-century minar of Kootub at Old Delhi, built of limestone with bands of marble. It is richly fluted on plan, and when complete was at least 250 feet high.

The best account of the Irish round towers is that given by Petrie, in his *Ecclesiastical Architecture of Ireland* (Dublin, 1845). See also Keane, *Towers and Temples of Ancient Ireland* (Dublin, 1850); Brash, *Ecclesiastical Architecture of Ireland* (Dublin, 1875); and Stokes, *Early Architecture in Ireland* (Dublin, 1878). (J. H. M.)

ROUNDEL. See **RONDEAU**.

ROUS, or **ROUSE**, FRANCIS (1579–1659), known by his translation of the Psalms; see vol. xii. p. 590. His works appeared at London in 1657.

ROUSSEAU, JACQUES (1630–1693), painter, a member of a Huguenot family, was born at Paris in 1630. He was remarkable as a painter of decorative landscapes and classic ruins, somewhat in the style of Canaletto, but without his delicacy of touch; he appears also to have been influenced by Nicolas Poussin. While quite young Rousseau went to Rome, where he was fascinated by the noble picturesqueness of the ancient ruins, and spent some years in painting them, together with the surrounding landscapes. He thus formed his style, which was highly artificial and conventionally decorative. His colouring for the most part is unpleasing, partly owing to his violent

treatment of skies with crude blues and orange, and his chiaroscuro usually is much exaggerated. On his return to Paris he soon became distinguished as a painter, and was employed by Louis XIV. to decorate the walls of his palaces at St Germain and Marly. He was soon admitted a member of the French Academy of the Fine Arts, but on the revocation of the edict of Nantes he was obliged to take refuge in Holland, and his name was struck off the Academy roll. From Holland he was invited to England by the duke of Montague, who employed him, together with other French painters, to paint the walls of his palace, Montague House.¹ Rousseau was also employed to paint architectural subjects and landscapes in the palace of Hampton Court, where many of his decorative panels still exist. He spent the latter part of his life in London, where he died in 1693.

Besides being a painter in oil and fresco Rousseau was an etcher of some ability; many etchings by his hand from the works of the Caracci and from his own designs still exist; they are vigorous, though too coarse in execution.

ROUSSEAU, JEAN BAPTISTE (1670-1741), a poet of some merit and a wit of considerable dexterity, was born at Paris on the 10th April 1670; he died at Brussels on the 17th March 1741. The son of a shoemaker, he is said to have been ashamed of his parentage and relations when he acquired a certain popularity, but the abundance of literary quarrels in which he spent his life, and the malicious inventiveness of his chief enemy, Voltaire, make any such stories of small account. He was certainly well educated and early gained favour with Boileau, who did not regard many people favourably; but authentic intelligence as to his youth is very scarce. He does not seem to have attempted literature very young, and when he began he began with the theatre, for which at no part of his life does he seem to have had any aptitude. A one-act comedy, *Le Café*, failed in 1694, and he was not much happier with a more ambitious play, *Les Flatteurs*, or with the opera of *Venus and Adonis*. He would not take these warnings, and tried in 1700 another comedy, *Le Capricieux*, which had the same fate. By this time he had already (it is not quite clear how) obtained influential patrons, such as Breteuil and Tallard, had gone with Tallard as an attaché to London, and, in days when literature still led to high position, seemed likely to achieve success. To tell the whole story of his misfortunes would take far more space than can be spared him here. They began with what may be called a club squabble at a certain Café Laurent, which was much frequented by literary men, and where Rousseau indulged in lampoons on his companions. A shower of libellous and sometimes obscene verses was written by or attributed to him, and at last he was practically turned out of the café. At the same time his poems, as yet only singly printed or in manuscript, acquired him a great reputation, and not unjustly, for Rousseau is certainly the best French writer of serious lyrics between Racine and Chénier. He had in 1701 been made a member of the Académie des Inscriptions; he had been offered, though he had not accepted, profitable places in the revenue department; he had become a favourite of the libertine but not unimportant coterie of the Temple; and in 1710 he presented himself as a candidate for the Académie Française. Then began the second chapter (the first had lasted ten years) of a history of the animosities of authors which is almost the strangest though not the most important on record. A copy of verses, more offensive than ever, was handed to the original object of Rousseau's jealousy, and, getting wind, occasioned the bastinadoing of the reputed author by a certain La Faye or La Faille, a soldier who was reflected

on. Legal proceedings of various kinds followed, and Rousseau either had or thought he had ground for ascribing the lampoon to Joseph Saurin. More law ensued, and the end of it was that in 1712 Rousseau, not appearing, was condemned *par contumace* to perpetual exile. He actually suffered it, remaining for the rest of his life in foreign countries except for a short time in 1738, when he returned clandestinely to Paris to try for a recall. It should be said that he might have had this if he had not steadfastly protested his innocence and refused to accept a mere pardon. No one has ever completely cleared up the story, and it must be admitted that, except as exhibiting very strikingly the strange idiosyncrasies of the 18th century in France, and as having affected the fortunes of a man of letters of some eminence, it is not worth much attention.

Rousseau's good and ill luck did not cease with his exile. First Prince Eugene and then other persons of distinction took him under their protection, and he printed at Soleure the first edition of his poetical works. But by fault or misfortune he still continued to quarrel. Voltaire and he met at Brussels in 1722, and, though Voltaire had hitherto pretended or felt a great admiration for him, something happened which turned this admiration into hatred. Voltaire's *Le Pour et Le Contre* is said to have shocked Rousseau, who expressed his sentiments freely. At any rate the latter had thenceforward no fiercer enemy than Voltaire. Rousseau, however, was not much affected by Voltaire's enmity, and pursued for nearly twenty years a life of literary work, of courtiership, and of rather obscure speculation and business. Although he never made his fortune, it does not seem that he was ever in want. When he died his death had the singular result of eliciting from a poetaster, Lefranc de Pompignan, an ode of real excellence and perhaps better than anything of Rousseau's own work. That work, however, has high merits, and is divided, roughly speaking, into two strangely contrasted divisions. One consists of formal and partly sacred odes and *cantates* of the stiffest character, the other of brief epigrams, sometimes licentious and always or almost always ill-natured. In the latter class of work Rousseau is only inferior to his friend Piron. In the former he stands almost alone. The frigidity of conventional diction and the disuse of all really lyrical rhythm which characterize his period do not prevent his odes and *cantates* from showing true poetical faculty, grievously cramped no doubt, but still existing.

Besides the Soleure edition mentioned above, Rousseau published (visiting England for the purpose) another issue of his work at London in 1723. The chief edition since is that of Amar in 1820. M. A. de Latour has published (Paris, Garnier, 1869) a useful though not complete edition, with notes of merit and a biographical introduction which would have been better if the facts had been more punctually and precisely stated.

ROUSSEAU, JEAN JACQUES (1712-1778), was born at Geneva on the 28th June 1712. His family had established themselves in that city at the time of the religious wars, but they were of pure French origin. Rousseau's father Isaac was a watchmaker; his mother, Suzanne Bernard, was the daughter of a minister; she died in childbirth, and Rousseau, who was the second son, was brought up in a very haphazard fashion, his father being a dissipated, violent-tempered, and foolish person. He, however, taught him to read early, and seems to have laid the foundation of the flighty sentimentalism in morals and politics which Rousseau afterwards illustrated with his genius. When the boy was ten years old his father got entangled in a disgraceful brawl and fled from Geneva, apparently without troubling himself about Jean Jacques. The father and son had little more to do with each other and rarely met. Rousseau was, however, taken charge of

¹ Montague House stood on the site of the British Museum.

by his mother's relations and was in the first place committed by them to the tutorship of a M. Lambercier, pastor at Bossey. Of these times as of the greater part of his life there are ample details in the *Confessions*, but it may be as well to remark at once that this famous book, however charming as literature, is to be used as documentary evidence only with great reserve. In 1724 he was removed from this school and taken into the house of his uncle Bernard, by whom he was shortly afterwards apprenticed to a notary. His master, however, found or thought him quite incapable and sent him back. After a short time (April 25, 1725) he was apprenticed afresh, this time to an engraver. He did not dislike the work, but was or thought himself cruelly treated by his master. At last in 1728, when he was sixteen, he ran away, the truancy being by his own account unintentional in the first instance, and due to the fact of the city gates being shut earlier than usual. Then began a very extraordinary series of wanderings and adventures, for much of which there is no authority but his own. He first fell in with some proselytizers of the Roman faith at Confignon in Savoy, and by them he was sent to Madame de Warens at Annecy, a young and pretty widow who was herself a convert. Her influence, however, which was to be so great, was not immediately exercised, and he was, so to speak, passed on to Turin, where there was an institution specially devoted to the reception of neophytes. His experiences here were (according to his own account, it must always be understood) sufficiently unsatisfactory, but he abjured duly and was rewarded by being presented with twenty francs and sent about his business. He wandered about in Turin for some time, and at last established himself as footman to a Madame de Vercellis. Here occurred the famous incident of the theft of a ribbon, of which he accused a fellow servant—a girl too. But, though he kept his place by this piece of cowardice, Madame de Vercellis died not long afterwards and he was turned off. He found, however, another place with the Comte de Gouvion, but lost this also through coxcombry. Then he resolved to return to Madame de Warens at Annecy. The chronology of all these events is somewhat obscure, but they seem to have occupied about three years.

Even then Rousseau did not settle at once in the anomalous but to him charming position of domestic lover to this lady, who, nominally a converted Protestant, was in reality, as many women of her time were, a kind of deist, with a theory of noble sentiment and a practice of libertinism tempered by good nature. It used to be held that in her conjugal relations she was even more sinned against than sinning. But recent investigations seem to show that M. de Vuarrens (which is said to be the correct spelling of the name) was a very unfortunate husband, and was deserted and robbed by his wife. However, she welcomed Rousseau kindly, thought it necessary to complete his education, and he was sent to the seminarians of St Lazare to be improved in classics, and also to a music master. In one of his incomprehensible freaks he set off for Lyons, and, after abandoning his companion in an epileptic fit, returned to Annecy to find Madame de Warens gone no one knew whither. Then for some months he relapsed into the life of vagabondage, varied by improbable adventures, which (according to his own statement) he so often pursued. Hardly knowing anything of music, he attempted to give lessons and a concert at Lausanne; and he actually taught at Neuchâtel. Then he became or says he became secretary to a Greek archimandrite who was travelling in Switzerland to collect subscriptions for the rebuilding of the Holy Sepulchre; then he went to Paris, and, with recommendations from the French ambas-

sador at Soleure, saw something of good society; then he returned on foot through Lyons to Savoy, hearing that Madame de Warens was at Chambéry. This was in 1732, and Rousseau, who for a time had unimportant employments in the service of the Sardinian crown, was shortly installed by Madame de Warens, whom he still called Manian, as *amant en titre* in her singular household, wherein she diverted herself with him, with music, and with chemistry. In 1736 Madame de Warens, partly for Rousseau's health, took a country house, Les Charmettes, a short distance from Chambéry. Here in summer, and in the town during winter, Rousseau led a delightful life, which he has delightfully described. In a desultory way he did a good deal of reading, but in 1738 his health again became bad, and he was recommended to go to Montpellier. By his own account this journey to Montpellier was in reality a *voyage à Cythère* in company with a certain Madame de Larnage. This being so, he could hardly complain when on returning he found that his official position in Madame de Warens's household had been taken by a person named Vintzenried. He was, however, less likely than most men to endure the position of second in command, and in 1740 he became tutor at Lyons to the children of M. de Mably, not the well-known writer of that name, but his and Condillac's elder brother. But Rousseau did not like teaching and was a bad teacher, and after a visit to Les Charmettes, finding that his place there was finally occupied, he once more went to Paris in 1741. He was not without recommendations. But a new system of musical notation which he thought he had discovered was unfavourably received by the Académie des Sciences, where it was read in August 1742, and he was unable to obtain pupils. Madame Dupin, however, to whose house he had obtained the entry, procured him the honourable if not very lucrative post of secretary to M. de Montaigu, ambassador at Venice. With him he stayed for about eighteen months, and has as usual infinite complaints to make of his employer and some strange stories to tell. At length he threw up his situation and returned to Paris (1745).

Up to this time—that is to say, till his thirty-third year—Rousseau's life, though continuously described by himself, was of the kind called subterranean, and the account of it must be taken with considerable allowances. There are, to say the least, grave improbabilities in it; there are some chronological difficulties; and in one or two instances his accounts have been flatly denied by persons more or less entitled to be heard. He had written nothing, and if he was known at all it was as an eccentric vagabond. From this time, however, he is more or less in view; and, though at least two events of his life—his quarrel with Diderot and his death—are and are likely long to be subjects of dispute, its general history can be checked and followed with reasonable confidence. On his return to Paris he renewed his relations with the Dupin family and with the literary group of Diderot, to which he had already been introduced by M. de Mably's letters. He had an opera, *Les Muses Galantes*, privately represented; he copied music for money, and received from Madame Dupin and her son-in-law M. de Francueil a small but regular salary as secretary. He lived at the Hotel St Quentin for a time, and once more arranged for himself an equivocal domestic establishment. His mistress, whom towards the close of his life he married after a fashion, was Thérèse le Vasseur, a servant at the inn. She had little beauty, no education or understanding, and few charms of any kind that his friends could discover, besides which she had a detestable mother, who was the bane of Rousseau's life. But he made himself at any rate for a time quite happy with her, and (according to Rousseau's account, the accuracy of

which has been questioned) five children were born to them, who were all consigned to the foundling hospital. This disregard of responsibility was partly punished by the use his critics made of it when he became celebrated as a writer on education and a preacher of the domestic affections. Diderot, with whom he became more and more familiar, admitted him as a contributor to the *Encyclopédie*. He formed new musical projects, and he was introduced by degrees to many people of rank and influence, among whom his warmest patron for a time was Madame d'Épinay. It was not, however, till 1749 that Rousseau made his mark. The academy of Dijon offered a prize for an essay on the effect of the progress of civilization on morals. Rousseau took up the subject, developed his famous paradox of the superiority of the savage state, won the prize, and, publishing his essay next year, became famous. The anecdote as to the origin of this famous essay is voluminous. It is agreed that the idea was suggested when Rousseau went to pay a visit to Diderot, who was in prison at Vincennes for his *Lettre sur les Aveugles*. Rousseau says he thought of the paradox on his way down; Morellet and others say that he thought of treating the subject in the ordinary fashion and was laughed at by Diderot, who showed him the advantages of the less obvious treatment. Diderot himself, who in such matters is almost absolutely trustworthy, does not claim the suggestion, but uses words which imply that it was at least partly his. It is very like him. The essay, however, took the artificial and crotchety society of the day by storm. Francueil gave Rousseau a valuable post as cashier in the receiver general's office. But he resigned it either from conscientiousness, or crotchety, or nervousness at responsibility, or indolence, or more probably from a mixture of all four. He went back to his music copying, but the salons of the day were determined to have his society, and for a time they had it. In 1752 he brought out at Fontainebleau an operetta, the *Devin du Village*, which was very successful. He received a hundred louis for it, and he was ordered to come to court next day. This meant the certainty of a pension. But Rousseau's shyness or his perversity (as before, probably both) made him disobey the command. His comedy *Narcisse*, written long before, was also acted, but unsuccessfully. In the same year, however, a letter *Sur la Musique Française* again had a great vogue.¹ Finally, for this was an important

¹ Rousseau's influence on French music was greater than might have been expected from his very imperfect education; in truth, he was a musician by natural instinct only, but his feeling for art was very strong, and, though capricious, based upon true perceptions of the good and beautiful. The system of notation (by figures) concerning which he read a paper before the Académie des Sciences, August 22, 1742, was ingenious, but practically worse than useless, and failed to attract attention, though the paper was published in 1748 under the title of *Dissertation sur la musique moderne*. In the famous "guerre des buffons," he took the part of the "buffonists," so named in consequence of their attachment to the Italian "opera buffa," as opposed to the true French opera; and, in his *Lettre sur la musique Française*, published in 1753, he indulged in a violent tirade against French music, which he declared to be so contemptible as to lead to the conclusion "that the French neither have, nor ever will have, any music of their own, or at least that, if they ever do have any, it will be so much the worse for them." This silly libel so enraged the performers at the Opera that they hanged and burned its author in effigy. Rousseau revenged himself by printing his clever satire entitled *Lettre d'un symphoniste de l'Académie Royale de Musique à ses camarades de l'orchestre*. His *Lettre à M. Burney* is of a very different type, and does full justice to the genius of Gluck. His articles on music in the *Encyclopédie* deal very superficially with the subject; and his *Dictionnaire de Musique* (Geneva, 1767), though admirably written, is not trustworthy, either as a record of facts or as a collection of critical essays. In all these works the imperfection of his musical education is painfully apparent, and his compositions betray an equal lack of knowledge, though his refined taste is as clearly displayed there as is his literary power in the *Letters* and *Dictionnaire*. His first opera, *Les Muses Galantes*, privately prepared at

year with him, the Dijon academy, which had founded his fame, announced the subject of "The Origin of Inequality," on which he wrote a discourse which was unsuccessful, but at least equal to the former in merit. During a visit to Geneva in 1754 Rousseau saw his old friend and love Madame de Warens (now reduced in circumstances and having lost all her charms), while after abjuring his abjuration of Protestantism he was enabled to take up his freedom as citizen of Geneva, to which his birth entitled him and of which he was proud. Some time afterwards, returning to Paris, he accepted a cottage near Montmorency (the celebrated Hermitage) which Madame d'Épinay had fitted up for him, and established himself there in April 1756. He spent little more than a year there, but it was a very important year. Here he wrote *La Nouvelle Héloïse*; here he indulged in the passion which that novel partly represents, his love for Madame d'Houdetot, sister-in-law of Madame d'Épinay, a lady still young and extremely amiable but very plain, who had a husband and a lover (St Lambert), and whom Rousseau's burning devotion seems to have partly pleased and partly annoyed. Here too arose the incomprehensible triangular quarrel between Diderot, Rousseau, and Grimm which ended Rousseau's sojourn at the Hermitage. It is impossible to discuss this at length here. The supposition least favourable to Rousseau is that it was due to one of his numerous fits of half-insane petulance and indignation at the obligations which he was nevertheless always ready to incur. That most favourable to him is that he was expected to lend himself in a more or less complaisant manner to assist and cover Madame d'Épinay's adulterous affection for Grimm. It need only be said that Madame d'Épinay's morals and Rousseau's temper are equally indefensible by anyone who knows anything about either, but that the evidence as to the exact influence of both on this particular transaction is hopelessly inconclusive. Diderot seems to have been guilty of nothing but thoughtlessness (if of that) in lending himself to a scheme of the Le Vasseurs, mother and daughter, for getting Rousseau out of the solitude of the Hermitage. At any rate Rousseau quitted the Hermitage in the winter, and established himself at Montlouis in the neighbourhood.

Hitherto Rousseau's behaviour had frequently made him enemies, but his writings had for the most part made him friends. The quarrel with Madame d'Épinay, with Diderot, and through them with the philosophe party reversed this. In 1758 appeared his *Lettre à d'Alembert contre les Spectacles*, written in the winter of the previous year at Montlouis. This was at once an attack on Voltaire, who was giving theatrical representations at Les Délices, on d'Alembert, who had condemned the prejudice against the stage in the *Encyclopédie*, and on one of the favourite amusements of the society of the day. Diderot personally would have been forgiving enough. But Voltaire's strong point was not forgiveness, and, though Rousseau no doubt exaggerated the efforts of his "enemies," he was certainly henceforward as obnoxious to the philo-

the house of La Popelinière, attracted very little attention; but *Le Devin du Village*, given at Fontainebleau in 1752, and at the Académie in 1753, achieved a great and well-deserved success. Though very unequal, and exceedingly simple both in style and construction, it contains some charming melodies, and is written throughout in the most refined taste. His *Pygmalion* (1775) is a melodrama without singing. Some posthumous fragments of another opera, *Daphnis et Chloé*, were printed in 1780; and in 1781 appeared *Les Consolations des Misères de ma Vie*, a collection of about one hundred songs and other fugitive pieces of very unequal merit. The popular air known as *Rousseau's Dream* is not contained in this collection, and cannot be traced back farther than J. B. Cramer's celebrated "Variations." M. Castil-Blaze has accused Rousseau of extensive plagiarisms (or worse) in *Le Devin du Village* and *Pygmalion*, but apparently without sufficient cause.

(W. S. R.)

sophe coterie as to the orthodox party. He still, however, had no lack of patrons—he never had—though his unsurpassable perversity made him quarrel with all in turn. The amiable duke and duchess of Luxembourg, who were his neighbours at Montlouis, made his acquaintance, or rather forced theirs upon him, and he was eagerly industrious in his literary work—indeed most of his best books were produced during his stay in the neighbourhood of Montmorency. A letter to Voltaire on his poem about the Lisbon earthquake embittered the dislike between the two, being surreptitiously published. *La Nouvelle Héloïse* appeared in the same year (1760), and it was immensely popular. In 1762 appeared the *Contrat Social* at Amsterdam, and *Émile*, which was published both in the Low Countries and at Paris. For the latter the author received 6000 livres, for the *Contrat* 1000.

Julie, ou La Nouvelle Héloïse, is a novel written in letters describing the loves of a man of low position and a girl of rank, her subsequent marriage to a respectable freethinker of her own station, the mental agonies of her lover, and the partial appeasing of the distresses of the lovers by the influence of noble sentiment and the good offices of a philanthropic Englishman. It is too long, the sentiment is overstrained, and severe moralists have accused it of a certain complaisance in dealing with amatory errors; but it is full of pathos and knowledge of the human heart. The *Contrat Social*, as its title implies, endeavours to base all government on the consent, direct or implied, of the governed, and indulges in much ingenious argument to get rid of the practical inconveniences of such a suggestion. *Émile*, the second title of which is *De l'Éducation*, is much more of a treatise than of a novel, though a certain amount of narrative interest is kept up throughout.

Rousseau's reputation was now higher than ever, but the term of the comparative prosperity which he had enjoyed for nearly ten years was at hand. The *Contrat Social* was obviously anti-monarchic; the *Nouvelle Héloïse* was said to be immoral; the sentimental deism of the "Profession du vicaire Savoyard" in *Émile* irritated equally the philosophe party and the church. On June 11, 1762, *Émile* was condemned by the parlement of Paris, and two days previously Madame de Luxembourg and the Prince de Conti gave the author information that he would be arrested if he did not fly. They also furnished him with means of flight, and he made for Yverdon in the territory of Bern, whence he transferred himself to Motiers in Neuchâtel, which then belonged to Prussia. Frederick II. was not indisposed to protect the persecuted when it cost him nothing and might bring him fame, and in Marshal Keith, the governor of Neuchâtel, Rousseau found a true and firm friend. He was, however, unable to be quiet or to practise any of those more or less pious frauds which were customary at the time with the unorthodox. The archbishop of Paris had published a pastoral against him, and Rousseau did not let the year pass without a *Lettre à M. de Beaumont*. The council of Geneva had joined in the condemnation of *Émile*, and Rousseau first solemnly renounced his citizenship, and then, in the *Lettres de la Montagne* (1763), attacked the council and the Genevan constitution unsparingly. All this excited public opinion against him, and gradually he grew unpopular in his own neighbourhood. This unpopularity is said on very uncertain authority to have culminated in a nocturnal attack on his house, which reminds the reader remarkably of an incident in the life of the greatest French man of letters of the present century. At any rate he thought he was menaced if he was not, and migrated to the Île St Pierre in the Lake of Bièvre, where he once more for a short, and the last, time enjoyed that idyllic existence

which he loved. But the Bernese Government ordered him to quit its territory. He was for some time uncertain where to go, and thought of Corsica (to join Paoli) and Berlin. But finally David Hume offered him, late in 1765, an asylum in England, and he accepted. He passed through Paris, where his presence was tolerated for a time, and landed in England on January 13, 1766. Thérèse travelled separately, and was entrusted to the charge of James Boswell, who had already made Rousseau's acquaintance. Here he had once more a chance of settling peaceably. Severe English moralists like Johnson thought but ill of him, but the public generally was not unwilling to testify against French intolerance, and regarded his sentimentalism with favour. He was lionized in London to his heart's content and discontent, for it may truly be said of Rousseau that he was equally indignant at neglect and intolerant of attention. When, after not a few displays of his strange humour, he professed himself tired of the capital, Hume procured him a country abode in the house of Mr Davenport at Wootton in Derbyshire. Here, though the place was bleak and lonely, he might have been happy enough, and he actually employed himself in writing the greater part of his *Confessions*. But his habit of self-tormenting and tormenting others never left him. His own caprices interposed some delay in the conferring of a pension which George III. was induced to grant him, and he took this as a crime of Hume's. The publication of a spiteful letter (really by Horace Walpole, one of whose worst deeds it was) in the name of the king of Prussia made Rousseau believe that plots of the most terrible kind were on foot against him. Finally he quarrelled with Hume because the latter would not acknowledge all his own friends and Rousseau's supposed enemies of the philosophe circle to be rascals. He remained, however, at Wootton during the year and through the winter. In May 1767 he fled to France, addressing letters to the lord chancellor and to General Conway, which can only be described as the letters of a lunatic. He was received in France by the Marquis de Mirabeau (father of the great Mirabeau), of whom he soon had enough, then by the Prince de Conti at Trye. From this place he again fled and wandered about for some time in a wretched fashion, still writing the *Confessions*, constantly receiving generous help, and always quarrelling with, or at least suspecting, the helpers. In the summer of 1770 he returned to Paris, resumed music copying, and was on the whole happier than he had been since he had to leave Montlouis. He had by this time married Thérèse le Vasseur, or had at least gone through some form of marriage with her.

Many of the best-known stories of Rousseau's life date from this last time, when he was tolerably accessible to visitors, though clearly half-insane. He finished his *Confessions*, wrote his *Dialogues* (the interest of which is not quite equal to the promise of their curious sub-title *Rousseau juge de Jean Jacques*), and began his *Rêveries du Promeneur Solitaire*, intended as a sequel and complement to the *Confessions*, and one of the best of all his books. It should be said that besides these, which complete the list of his principal works, he has left a very large number of minor works and a considerable correspondence. During this time he lived in the Rue Platière, which is now named after him. But his suspicions of secret enemies grew stronger rather than weaker, and at the beginning of 1778 he was glad to accept the offer of M. de Girardin, a rich financier, and occupy a cottage at Ermenonville. The country was beautiful; but his old terrors revived, and his woes were complicated by the alleged inclination of Thérèse for one of M. de Girardin's stable boys. On July 2d he died in a manner which has been much discussed, sus-

pitions of suicide having at the time and since been frequent. On the whole the theory of a natural death due to a fit of apoplexy and perhaps to injuries inflicted accidentally during that fit seems most probable. He had always suffered from internal and constitutional ailments not unlikely to bring about such an end.

Rousseau's character, the history of his reputation, and the intrinsic value of his literary work are all subjects of much interest. There is little doubt that for the last ten or fifteen years of his life, if not from the time of his quarrel with Diderot and Madame d'Épinay, he was not wholly sane—the combined influence of late and unexpected literary fame and of constant solitude and discomfort acting upon his excitable temperament so as to overthrow the balance, never very stable, of his fine and acute but unrobust intellect. He was by no means the only man of letters of his time who had to submit to something like persecution. Fréron on the orthodox side had his share of it, as well as Voltaire, Helvétius, Diderot, and Montesquieu on that of the innovators. But Rousseau had not, like Montesquieu, a position which guaranteed him from serious danger; he was not wealthy like Helvétius; he had not the wonderful suppleness and trickiness which even without his wealth would probably have defended Voltaire himself; and he lacked entirely the "bottom" of Fréron and Diderot. When he was molested he could only shriek at his enemies and suspect his friends, and, being more given than any man whom history mentions to this latter weakness, he suffered intensely from it. His moral character was undoubtedly weak in other ways than this, but it is fair to remember that but for his astounding *Confessions* the more disgusting parts of it would not have been known, and that these *Confessions* were written, if not under hallucination, at any rate in circumstances entitling the self-condemned criminal to the benefit of very considerable doubt. If Rousseau had held his tongue, he might have stood lower as a man of letters; he would pretty certainly have stood higher as a man. He was, moreover, really sinned against, if still more sinning. The conduct of Grimm to him was certainly very bad; and, though Walpole was not his personal friend, a worse action than his famous letter, considering the well-known idiosyncrasy of the subject, would be difficult to find. It was his own fault that he saddled himself with the Le Vasseurs, but their conduct was probably if not certainly ungrateful in the extreme. Only excuses can be made for him; but the excuses for a man born, as Hume after the quarrel said of him, "without a skin" are numerous and strong.

It was to be expected that his peculiar reputation would increase rather than diminish after his death; and it did so. During his life his personal peculiarities and the fact that his opinions were nearly as obnoxious to the one party as to the other worked against him, but it was not so after his death. The men of the Revolution regarded him with something like idolatry, and his literary merits conciliated many who were very far from idolizing him as a revolutionist. His style was taken up by Bernardin de Saint Pierre and by Chateaubriand. It was employed for purposes quite different from those to which he had himself applied it, and the reaction triumphed by the very arms which had been most powerful in the hands of the Revolution. Byron's fervid panegyric enlisted on his side all who admired Byron—that is to say, the majority of the younger men and women of Europe between 1820 and 1850—and thus different sides of his tradition were continued for a full century after the publication of his chief books. His religious unorthodoxy was condoned because he never scoffed; his political heresies, after their first effect was over, seemed harmless from the very want of logic and practical spirit in them, while part at least of his literary secret was the common property of almost everyone who attempted literature. At the present day persons as different as M. Renan and Mr Ruskin are children of Rousseau.

It is therefore important to characterize this influence which was and is so powerful, and there are three points of view—those of religion, politics, and literature—which it is necessary to take in doing this. In religion Rousseau was undoubtedly what he has been called above—a sentimental deist; but no one who reads him with the smallest attention can fail to see that sentimentalism was the essence, deism the accident of his creed. In his time orthodoxy at once generous and intelligent hardly existed in France. There were ignorant persons who were sincerely orthodox; there were intelligent persons who pretended to be so. But between the time of Massillon and D'Aguesseau and the time of Lamennais and Joseph de Maistre the class of men of whom in England Berkeley, Butler, and Johnson were representatives simply did not exist in France. Little inclined by nature to any but the emotional side of religion, and utterly undisciplined in any other by education, course of life, or the general tendency of public opinion, Rousseau naturally took refuge in the nebulous kind of natural religion which was at once fashionable and convenient. If his practice fell very far short even of his own very arbitrary standard of morality as much may be said of persons far more dogmatically orthodox.

In politics, on the other hand, there is no doubt that Rousseau was a sincere and, as far as in him lay, a convinced republican. He had no great tincture of learning, he was by no means a profound logician, and he was impulsive and emotional in the extreme—characteristics which in political matters undoubtedly predispose the subject to the preference of equality above all political requisites. He saw that under the French monarchy the actual result was the greatest misery of the greatest number, and he did not look much further. The *Contrat Social* is for the political student one of the most curious and interesting books existing. Historically it is null; logically it is full of gaping flaws; practically its manipulations of the *volonté de tous* and the *volonté générale* are clearly insufficient to obviate anarchy. But its mixture of real eloquence and apparent cogency is exactly such as always carries a multitude with it, if only for a time. Moreover, in some minor branches of politics and economics Rousseau was a real reformer. Visionary as his educational schemes (chiefly promulgated in *Émile*) are in parts, they are admirable in others, and his protest against mothers refusing to nurse their children hit a blot in French life which is not removed yet, and has always been a source of weakness to the nation.

But it is as a literary man pure and simple—that is to say, as an exponent rather than as an originator of ideas—that Rousseau is most noteworthy, and that he has exercised most influence. The first thing noticeable about him is that he defies all customary and mechanical classification. He is not a dramatist—his work as such is insignificant—nor a novelist, for, though his two chief works except the *Confessions* are called novels, *Émile* is one only in name, and *La Nouvelle Héloïse* is as a story diffuse, prosy, and awkward to a degree. He was perfectly without command of poetic form, and he could only be called a philosopher in an age when the term was used with such meaningless laxity as was customary in the 18th century. If he must be classed, he was before all things a describer—a describer of the passions of the human heart and of the beauties of nature. In the first part of his vocation the novelists of his own youth, such as Marivaux, Richardson, and Prévost, may be said to have shown him the way, though he improved greatly upon them; in the second he was almost a creator. In combining the two and expressing the effect of nature on the feelings and of the feelings on the aspect of nature he was absolutely without a forerunner or a model. And, as literature since his time has been chiefly differentiated from literature before it by the colour and tone resulting from this combination, Rousseau may be said to hold, as an influence, a place almost unrivalled in literary history. The defects of all sentimental writing—occasional triviality and exaggeration of trivial things, diffuseness, overstrained emotion, false sentiment, disregard of the intellectual and the practical—are of course noticeable in him, but they are excused and palliated by his wonderful feeling, and by what may be called the passionate sincerity even of his insincere passages. Some cavils have been made against his French, but none of much weight or importance. And in such passages as the famous "Voilà de la pervenche" of the *Confessions*, as the description of the isle of St Pierre in the *Réveries*, as some of the letters in the *Nouvelle Héloïse* and others, he has achieved the greatest success possible—that of absolute perfection in doing what he intended to do. The reader, as it has been said, may think he might have done something else with advantage, but he can hardly think that he could have done this thing better.

The dates of most of Rousseau's works published during his lifetime have been given above. The *Confessions* and *Réveries*, which, read in private, had given much umbrage to persons concerned, and which the author did not intend to be published until the end of the century, appeared at Geneva in 1782. In the same year and the following appeared a complete edition in forty-seven small volumes. There have been many since, the most important of them being that of Musset-Pathay (Paris, 1822). Some unpublished works, chiefly letters, were added by Bosscha (Paris, 1858) and Streckeisen Moulton (Paris, 1861). The most convenient edition is perhaps that of Didot in 4 vols. large 8vo, but a handsome and well-edited collection is still something of a desideratum. Works on Rousseau are innumerable. The chief are—in French that of Saint Marc Girardin (1874), in English the excellent book of Mr John Morley. (G. SA.)

ROUSSEAU, THÉODORE (1812–1867), a distinguished landscape painter, was born at Paris, and studied in the École des Beaux-Arts, after which he spent some time in travelling and making studies of landscape and sky effects. He first exhibited at the Salon in 1834, obtained gold medals in 1849 and 1854, and in 1852 received the Legion of Honour. His paintings became very popular in France, and Rousseau grew to be the acknowledged founder of the modern realistic school of landscape. He was largely influenced in style by Constable and Turner, the former of whom was perhaps more thoroughly appreciated in France than in England. The influence of Turner is clearly seen in some of Rousseau's pictures, with striking effects of cloud or storm,—as, for example, in his *Effet de Soleil et Après la Pluie* (1852), in the *Matinée*

Orageuse (1857), the *Coucher de Soleil* (1866), and one of his last works, the *Soleil par un Temps Orageux*, which appeared in the exhibition of 1867. Rousseau's study of Constable is more especially apparent in some of his fine forest scenes near Fontainebleau, and in some magnificently painted views on the banks of the Loire and other French rivers. His execution was of extraordinary brilliance, and he was a thorough master of atmospheric effect and glowing sunset colours. Though in some respects a realistic painter, he treated nature in a strongly dramatic way and showed great imaginative power. His style is broad and dashing, with rapid and at times apparently careless handling. His fame has increased rather than diminished since his death in 1867; and one of his paintings has recently received the high distinction of being transferred from the Luxembourg Palace to the Louvre, an honour which is but rarely conferred. It is not, however, one of the best specimens of his work. Most of Théodore Rousseau's pictures are in private collections in Paris and elsewhere in France.

ROUSSILLON, a province of France, which now forms the greater part of the department of PYRÉNÉES ORIENTALES (*q.v.*). It was bounded on the south by the Pyrenees, on the west by the county of Foix, on the north by Languedoc, and on the east by the Mediterranean. The province derived its name from a small bourg near Perpignan, the capital, called Ruscino (Rosceliona, Castel Rossello), where the Gallic chieftains met to consider Hannibal's request for a conference. The district formed part of the Roman province of Gallia Narbonensis from 121 B.C. to 462 A.D., when it was ceded with the rest of Septimania to Theodoric II., king of the Visigoths. His successor, Amalaric, on his defeat by Clovis in 531 retired to Spain, leaving a governor in Septimania. In 719 the Saracens crossed the Pyrenees, and Septimania was held by them until their defeat by Pippin in 756. On the invasion of Spain by Charlemagne in 778 he found the borderlands wasted by the Saracenic wars, and the inhabitants hiding among the mountains. He accordingly made grants of land to Visigothic refugees from Spain, and founded several monasteries, round which the people gathered for protection. In 792 the Saracens again invaded France, but were repulsed by Louis, king of Aquitaine, whose rule extended over all Catalonia as far as Barcelona. The different portions of his kingdom in time grew into allodial fiefs, and in 893 Suniaria II. became the first hereditary count of Roussillon. But his rule only extended over the eastern part of what became the later province. The western part, or Cerdagne, was ruled in 900 by Miron as first count, and one of his grandsons, Bernard, was the first hereditary count of the middle portion, or Bésalu. In 1111 Raymond-Bérenger III., count of Barcelona, inherited the fief of Bésalu, to which was added in 1117 that of Cerdagne; and in 1172 his grandson, Alphonso II., king of Aragon, united Roussillon to his other states on the death of the last count, Gerard II. The counts of Roussillon, Cerdagne, and Bésalu were not sufficiently powerful to indulge in any wars of ambition. Their energies had been accordingly devoted to furthering the welfare of their people, who enjoyed both peace and prosperity under their rule. Under the Aragonese monarchs the progress of the united province still continued, and Collioure, the port of Perpignan, became a centre of Mediterranean trade. But the country was in time destined to pay the penalty of its position on the frontiers of France and Spain in the long struggle for ascendancy between these two powers. James I. of Aragon had wrested the Balearic Isles from the Moors and left them with Roussillon to his son James (1276), with the title of king of Majorca. The consequent

disputes of this monarch with his brother Pedro III. of Aragon were not lost sight of by Philip III. of France in his quarrel with the latter about the crown of the Two Sicilies. Philip espoused James's cause and led his army into Spain, but retreating died at Perpignan in 1285. James then became reconciled to his brother, and in 1311 was succeeded by his son Sancho, who founded the cathedral of Perpignan shortly before his death in 1324. His successor James II. refused to do homage to Philip VI. of France for the seignior of Montpellier, and applied to Pedro IV. of Aragon for aid. Pedro not only refused it, but on various pretexts declared war against him, and seized Majorca and Roussillon in 1344. The province was now again united to Aragon, and enjoyed peace until 1462. In this year the disputes between John II. and his son about the crown of Navarre gave Louis XI. of France an excuse to support John against his subjects, who had risen in revolt. Louis at the fitting time turned traitor, and the province having been pawned to him for 300,000 crowns was occupied by the French troops until 1493, when Charles VIII. restored it to Ferdinand and Isabella. During the war between France and Spain (1496-98) the people suffered equally from the Spanish garrisons and the French invaders. But dislike of the Spaniards was soon effaced in the pride of sharing in the glory of Charles V., and in 1542, when Perpignan was besieged by the dauphin, the Roussillonnais remained true to their allegiance. Afterwards the decay of Spain was France's opportunity, and, on the revolt of the Catalans against the Castilians in 1641, Louis XIII. espoused the cause of the former, and by the treaty of 1659 secured Roussillon to the French crown.

ROVEREDO (in German sometimes *Rofreit*), one of the chief industrial cities in South Tyrol, and, after Trent, the chief seat of the Tyrolese silk industry, is situated on the left bank of the Adige (Etsch), in the fertile Val Lagarina, 35 miles north of Verona and 100 miles south of Innsbruck. Though there are several open places within the town, the streets, except in the newer quarters, are narrow, crooked, and uneven. Of the two parish churches, S. Marco dates from the 15th century and Sta Maria del Carmine from 1678. The only other interesting building is the quaint old castle known as Castell Junk. As an active trading town and administrative centre Roveredo is well equipped with commercial, judicial, educational, and benevolent institutions. Though the district between Trent and Verona yields about 120,000 lb of silk annually, the silk industry of Roveredo, introduced in the 16th century, has declined during the last fifty years. The establishments in which the cocoons are unwound (*filande*) are distinct from those in which the silk is spun (*filatoje*). The silk is not woven at Roveredo. Paper and leather are the other chief manufactures of the place; and a brisk trade in southern fruits and red wine is carried on. The population is 8864.

The origin of Roveredo is probably to be traced to the founding of the castle by William of Castelbarco-Lizzana about 1300. Later it passed to the emperor Frederick of the Empty Pockets, who sold it to Venice in 1413. The treaty of Cambray transferred it from Venice to the emperor Maximilian in 1510, since which time it has shared the fate of southern Tyrol, finally passing to Austria in 1814. In September 1709 the French under Masséna won a victory over the Austrians near Roveredo. Near the neighbouring village of St Marco are the traces of a destructive landslide in 883, described in the *Inferno* (xii. 4-9) by Dante, who spent part of his exile in 1302 in a castle near Lizzana.

ROVIGNO, a city of Austria, in the province of Istria, is picturesquely situated on the coast of the Adriatic, about 12 miles south of Parenzo, and 10 miles by rail from Canfanaro, a junction on the railway between Divazza (Trieste) and Pola. It has two harbours, with ship-building yards; and it carries on several industries and a

good export trade, especially in olive-oil and a cement manufactured in the little island of Sant' Andrea. The population was 9564 in 1869 and 9522 in 1880.

According to tradition Rovigno was originally built on an island, Cissa by name, which disappeared during the earthquakes about 787. In the 6th century, as the local legend has it, the body of St. Euphemia of Chalcedon was miraculously conveyed to the island; and at a later date it was transported to the summit of the promontory, Monte di Sant' Eufemia, whither it was restored by the Venetians in 1410 after being in the possession of the Genoese from 1380. The diocese of Rovigno was merged in 1008 in the bishopric of Parenzo; but its church continued to have the title of cathedral. Rovigno passed definitively into the hands of the Venetians in 1830, and it remained true to the republic till the treaty of Campo Formio (1797).

ROVIGO, a city of Italy, the chief town of a province, and the seat of the bishop of Adria, lies between the Po and the Adige, and is traversed by the Adigetto, a navigable branch of the Adige. By rail it is 27 miles south-south-west of Padua. The architecture bears the stamp both of Venetian and Ferrarese influence. The cathedral church of Santo Stefano (1696) is of less interest than La Madonna del Soccorso, an octagon (with a fine campanile), begun in 1594. The town-hall contains a library of 80,000 volumes belonging to the Accademia de' Concordi, founded in 1580, and a picture gallery enriched with the spoils of the monasteries. Wool, silk, linen, and leather are among the local manufactures. The population of the city proper was 7452 in 1871 and 7272 in 1881; the commune in 1881 had 11,460 inhabitants.

Rovigo (Neo-Latin *Rhodigium*) appears to be mentioned as Rudigo in 838. It was selected as his residence by the bishop of Adria on the destruction of his city by the Huns. From the 11th to the 14th century the Este family was usually in authority; but the Venetians who obtained the town and castle in pledge between 1390 and 1400 took the place by siege in 1482, and, though the Este more than once recovered it, the Venetians, returning in 1514, retained possession till the French Revolution. In 1806 the city was made a duchy in favour of General Savary. The Austrians in 1815 created it a royal city.

ROVIGO, DUKE OF. See SAVARY.

ROWE, NICHOLAS (1674–1718), the descendant of a family long resident at Lamerton in Devon, was born at Little Barford in Bedfordshire, June 30, 1674. The house in which he was born is close to the Great North Road, and a small stone to his memory has been erected in the centre of the garden. His father, John Rowe, took to the law as his profession, and at his death in 1692 (by which time he had attained to the dignity of being a serjeant at law) had amassed sufficient property to leave to his son an income of £300 a year. Nicholas Rowe passed some time in a private school at Highgate, and then proceeded to Westminster School, at that time under the charge of the celebrated master Dr Busby. In 1688 he became a king's scholar in this foundation, but three years later he was called away from school and entered as a student at the Middle Temple. The study of the law had little attraction for a young man of good person and lively manners, and at his father's death in the following year he devoted himself to society and to literature. His first play, *The Ambitious Stepmother*, was produced when he was twenty-five years old. It was followed by *Tamerlane*, a patriotic composition in which the virtues of William III. were lauded under the disguise of Tamerlane and the vices of the French king, Louis XIV., were denounced in the person of Bajazet. The popularity of this production soon declined, but for many years it was acted once every year, on the anniversary of the landing at Torbay of the Dutch prince. His next play, *The Fair Penitent*, long retained the favourable reception which marked its first appearance, and was pronounced by the great critic of the 18th century one of the most pleasing tragedies which had ever been written. Through its suc-

cess the name of the principal male character Lothario became identified in popular language as the embodiment of the manners and habits of a fashionable rake. After the production of two more tragedies, *Ulysses* and *The Royal Convert*, of slight account at the time and long since forgotten, Rowe tried his hand on a comedy, *The Biter*. Much to the author's surprise his attempt in this new direction proved a failure, but Rowe recognized the justice of the verdict of the audience sufficiently to abstain from risking a second disappointment. His two last dramatic works were entitled *Jane Shore* and *Lady Jane Grey*, and the former of them, from the popularity of its subject and the elegance of its language, kept its position on the stage longer than any other of his works.

Rowe excelled most of his contemporaries in the knowledge of languages. He was acquainted more or less thoroughly with Greek, Latin, French, Italian, and Spanish. The latter tongue he is said to have acquired on the recommendation of Harley and with the expectation that he would afterwards be rewarded by some high office. When, however, he reported his new acquisition to the new minister he was met with the dry remark from Harley—"How I envy you the pleasure of reading Don Quixote in the original!" Notwithstanding this disappointment, Rowe enjoyed many lucrative posts during his short life. When the duke of Queensberry was principal secretary of state for Scotland (1708–10), Rowe acted as his under-secretary. On the accession of George I. he was made a surveyor of customs, and on the death of Tate he became poet laureate. He was also appointed clerk of the council to the prince of Wales, and the list of preferments was closed by his nomination by Lord-Chancellor Parker (5th May 1718) as secretary of presentations in Chancery. He died 6th December 1718, and was buried in the south cross of Westminster Abbey. By his first wife, a daughter of Mr Parsons, one of the auditors of the revenue, he left a son John; and by his second wife, Anne, the daughter of Joseph Devenish of a Dorsetshire family, he had an only daughter, Charlotte, born in 1718, who married Henry Fane, a younger brother of Thomas, eighth earl of Westmoreland. The burials of mother and daughter are recorded in Colonel Chester's *Registers of Westminster Abbey*.

Rowe's tragedies were marked by passionate feeling set off by a graceful diction, and were well adapted for stage effect. If *The Fair Penitent* and *Jane Shore* have been expelled from the stage, their historic reputation and their style will repay perusal.

Among Rowe's other literary efforts may be mentioned an edition of the works of Shakespeare (1709), for which he received from Lintot the bookseller the sum of £36, 10s., a rate of pay not out of proportion to the labour which was bestowed upon the task. At the time of his death he had also finished a translation of Lucan's *Pharsalia*, a work then much praised and not yet superseded by any competitor. Rowe's minor poems were beneath the level of his age. An edition of his works was published in 1720 under the care of Mr (afterwards Bishop) Newton. His translation of Lucan was edited by Dr Welwood.

ROWING is the act of driving forward or propelling a boat along the surface of the water by means of oars. It is remarkable how scanty, until quite recent times, are the records of this art, which at certain epochs has played no insignificant part in the world's history. It was the oar that brought Phœnician letters and civilization to Greece; it was the oar that propelled the Hellenic fleet to Troy; it was the oar that saved Europe from Persian despotism; it was the skilful use of the oar by free citizens which was the glory of Athens in her prime. It is to be regretted that so little is known of the details connected with it, or of the disposal of the rowers on board the splendid fleet which started in its pride for Sicily, when 17,000 oars at a given signal smote the brine, and 100 long ships raced as far as Ægina. The vessels of the ancient Greeks and

Romans—the biremes, quadriremes, quinquiremes, and hexiremes—owed their pace to the exertions of men who plied the oar rather than to the sails with which they were fitted, and which were only used when the wind was favourable. Professor Gardner has shown that boat racing was not uncommon among the Greeks;¹ and that it was practised among the Romans Virgil testifies in the well-known passage in the fifth book of the *Æneid*. And the Venetian galleys which were subsequently used on the shores of the Mediterranean in mediæval times were only a modified form of the older kind of craft. These were for the most part manned by slaves and criminals, and were in constant employment in most European countries.

Rowing was understood by the ancient Britons, as they trusted themselves to the mercy of the waves in coracles composed of wicker-work covered with leather, similar no doubt in many respects to those now used in Wales; but these frail vessels were propelled by paddles and not by oars. The Saxons seem to have been expert in the management of the oar, as well as the Danes and Norwegians, as it is recorded that the highest nobles in the land devoted themselves to it. Alfred the Great introduced long galleys from the Mediterranean, which were propelled by forty or sixty oars on each side, and for some time these vessels were used for war purposes. It is stated by William of Malmesbury that Edgar the Peaceable was rowed in state on the river Dee from his palace, in the city of West Chester, to the church of St John and back again, by eight tributary kings, himself acting as coxswain.

Boat quintain, or tilting at one another on the water, was first brought into England by the Normans as an amusement for the spring and summer season, and probably much of the success of the champions depended upon the skill of those who managed the boats. Before the beginning of the 12th century the rivers were commonly used for conveying passengers and merchandise on board barges and boats, and until the introduction of coaches they were almost the only means of transit for royalty, and for the nobility and gentry who had mansions and watergates on the banks of the Thames. It is, however, impossible to trace the first employment of bargemen, wherry-men, or watermen, but they seem to have been well established by that time, and were engaged in ferrying and other waterside duties. During the long frosts of the early part of the 13th century, frequent mention is made in the chronicles of the distress among the watermen, from which we may assume that their numbers were large. They were employed in conveying the nobles and their retinues to Runnymede, where they met King John and where Magna Charta was signed. Towards the close of this century the watermen of Greenwich were frequently fined for overcharging at the established ferries, and about the same time some of the city companies established barges for water processions. We learn from Fabian and Middleton that in 1454 "Sir John Norman, then lord mayor of London, built a noble barge at his own expense, and was rowed by watermen with silver oars, attended by such of the city companies as possessed barges, in a splendid manner," and further "that he made the barge he sat in burn on the water"; but there is no explanation of this statement. Sir John Norman was highly commended for this action by the members of the craft, as no doubt it helped to popularize the fashion then coming into vogue of being rowed on the Thames by the watermen who plied for hire in their wherries. The lord mayor's procession by water to Westminster, which figures on the front page of the *Illustrated London News*, was made annually until the year 1856, when it was discontinued. The lord

mayor's state barge was a magnificent species of shallop rowed by watermen; and the city companies had for the most part barges of their own, all rowed double-banked with oars in the fore half, the after part consisting of a cabin something like that of a gondola. The watermen became by degrees so large and numerous a body that in the sixth year of the reign of Henry VIII. (1514) an Act was passed making regulations for them. This Act has from time to time been amended by various statutes, and the last was passed in 1858. Much time seems to have been spent in pleasuring on the water in the 15th and 16th centuries, and no doubt competitions among the watermen were not uncommon, though there is no record of them. The principal occupation of watermen, who were obliged to serve an apprenticeship, used to be ferrying and rowing fares on the Thames, but in process of time the introduction of bridges and steamers drove them from this employment, and the majority of them now work as bargemen, lightermen, and steamboat hands, having still to serve an apprenticeship. For many years matches for money stakes were frequent (1831 to 1880), but the old race of watermen, of which Phelps, the senior Kelley, Campbell, Coombes, Newell, the MacKinneys, Messenger, Pocock, and Henry Kelley were prominent members, has almost died out, and some of the best English scullers during the last fifteen years have been landmen.

Apart from the reference already made to the ancients, we do not find any records of boat-racing before the establishment in England of the coat and badge, instituted by the celebrated comedian Thomas Doggett in 1715, in honour of the house of Hanover, to commemorate the anniversary of "King George I.'s happy accession to the throne of Great Britain." The prize was a red coat with a large silver badge on the arm, bearing the white horse of Hanover, and the race had to be rowed on the 1st of August annually on the Thames, by six young watermen who were not to have exceeded the time of their apprenticeship by twelve months. Although the first contest took place in the year above mentioned, the names of the winners have only been preserved since 1791. The race continues at the present day, but under slight modifications. The first regatta appears to have occurred about sixty years later, for we learn from the *Annual Register* of the year 1775 that an entertainment called by that name (Ital., *regata*), introduced from Venice into England, was exhibited on the Thames off Ranelagh Gardens, and a lengthy account of it is given at the end of the work. The lord mayor's and several of the city companies' pleasure barges were conspicuous, and, although we learn very little indeed of the competing wager boats, it seems clear they were rowed by watermen. We find from Strutt's *Sports and Pastimes* (first published in 1801) that the proprietor of Vauxhall Gardens had for some years given a new wherry to be rowed for by watermen, two in a boat, which is perhaps the first pair-oared race on record. Similar prizes were also given by Astley, the celebrated horseman and circus proprietor of the Westminster Bridge Road, about the same period; but thus far rowing was apparently viewed as a laborious exercise, and the rowers were paid. At the commencement of the present century, however, rowing associations were formed, and the "Star," "Arrow," "Shark," and "Siren" Clubs had races amongst themselves, generally over long courses and in heavy six-oared boats. The Star and Arrow Clubs ceased to exist in the early years of this century, and were merged in the newly formed Leander Club. The date of its establishment cannot be fixed exactly, but it was probably about 1818 or 1819. It ranked high, because the majority of its members had frequently distinguished themselves in matches with the oar and sculls. They were the first to patronize and lend

¹ *Journal of Hellenic Studies*, 1881.

a helping hand to young watermen who showed promise of aquatic fame, and they likewise instituted a coat and badge for scullers.

The first record of public-school racing which can now be seen is the Water Ledger of Westminster School, which commences in the year 1813 with a list of the crew of the six-oared Fly. This craft continued for some time to be the only boat of the school, and in 1816 beat the Temple six-oar in a race from Johnson's Dock to Westminster Bridge by half a length. Eton possessed a fleet of boats in 1811, if not at an earlier date, consisting of a ten-oar and three boats with eight oars. In those days some of the crews had a waterman to pull stroke and drill the crew, but this practice was abolished in 1828, as the waterman frequently rowed a bad stroke and the crew were obliged to subscribe for his day's pay, beer, and clothes; thenceforward the captain of each crew rowed the stroke-oar. (The earliest record of a race at Eton is when Mr Carter's four rowed against the watermen and beat them in 1817; but the professionals had a boat too small for them. In 1818 Eton challenged Westminster School to row from Westminster to Kew Bridge against the tide, but the match was stopped by the authorities; and it was not until 1829 that the first contest between the two schools was brought to an issue.

Rowing appears to have commenced at the universities soon after the beginning of the century, but earlier at Oxford than at Cambridge. There were college boats on the river for some time before there were any races. Those first recorded at Oxford were in 1816, said to be college eights, but the boats used are more likely to have been fours, when Brasenose was "head of the river" and Jesus their chief opponent. These two clubs were constantly rowing races, but they were not very particular about the oarsmen in the boats, as the Brasenose crew in 1824 was composed of two members of the college, a Worcester man, and a waterman. The first authentic records commence in 1836, and the Oxford University Boat Club was established in 1839. At Cambridge eight-oared rowing was not in fashion so soon as at Oxford, the first eight (belonging to St John's College) not having been launched until 1826; and between that year and 1829 the Cambridge University Boat Club was formed. Eight-oared races were established on the Cam in 1827, when First Trinity was "head of the river," and in 1828 the first Oxford and Cambridge University boat race was proposed and fixed for June 10, 1829, on the Thames, from Hambledon Lock to Henley Bridge. The race was rowed at intermittent periods up to 1856, since which year it has been annual. In 1830 the amateur championship of the Thames was instituted by Mr Henry C. Wingfield, who presented a pair of silver sculls to be rowed for annually by the amateur scullers of the Thames on the 10th August from Westminster to Putney at half flood, but the course and date of the race have been changed since then. The first scullers' race for the professional championship of the Thames was rowed from Westminster to Putney on the 8th September 1831, Charles Campbell of Westminster defeating John Williams of Waterloo Bridge. During the next eight years rowing increased in favour among amateurs, and, as it had taken its proper place among the national pastimes, and the want of a central spot for a regatta was much felt, Henley-on-Thames was chosen, and it was decided that a regatta should be held there in 1839, and the Grand Challenge cup for eight oars was established. This has been an annual fixture ever since, prizes being given for four oars, pair oars, and scullers, as well as for eight oars. In 1843 the Royal Thames Regatta was started at Putney, and it gave a gold challenge cup for eight oars and a silver challenge cup for four oars, to be rowed by amateurs. In 1844 Oxford beat Cambridge at this regatta, and in the same year the committee added a champion prize for watermen. About this time the Old Thames Club was established, and they carried off the gold challenge cup by winning it for three years in succession, viz., 1846 to 1848. In 1852 the Argonauts Club first appeared at Henley and won the Visitors' cup, and in 1853 the Royal Chester Rowing Club were successful in the Stewards' cup for four oars, and won the Grand Challenge cup for eight oars the next year. In 1856 the London Rowing Club was established, but those members of it who rowed at Henley were obliged to enter under the name of the Argonauts Club, as, not having been in existence a year, its crew could not compete under its name. The next year, however, they carried off the Grand Challenge cup from Oxford University, and were successful in the Stewards' cup as well. Many more clubs, such as the Kingston, Radley, West London, Twickenham, Thames, Moulsey, and other metropolitan and provincial clubs were subsequently established, and have met with varied success.

Boats.—The boats of the present day differ very much from those formerly used, and the heavy lumbering craft which alone were known to our forefathers have been superseded by a lighter description,—skiffs, gigs, and racing outriggers. The old Thames wherry with its long projecting bow is now seldom seen, and a roomy skiff, often used with a sail when the wind is favourable, has taken its place. The gig is an open boat with several strakes, having the rowlocks or pieces of wood between which the oar works, fixed upon the

gunwale, which is level all round. The skiff is wider and longer than the gig and of greater depth, and, rising higher fore and aft, with rowlocks placed on a curved and elevated gunwale, has greater carrying power and rows lighter than the gig. The wherry rises high at the bows with a long nose pointed upwards and a very low stern, being consequently unsuited for rough water. The modern racing boat differs much from the foregoing, as its width has been decreased so as to offer as little resistance to the water as possible, while it is propelled by oars working between rowlocks fixed on projecting iron rods and cross pieces which are made fast to the timbers. These rods and cross pieces are rigged out from the side of the boats, and hence the term outriggers. These boats are constructed for single scullers, for pairs, for fours, for eights, and occasionally for twelve oars. The outrigger was first brought to perfection by the late Henry Clasper of Newcastle-on-Tyne, who is generally believed to have been its inventor; but the first outriggers, which were only rude pieces of wood fastened on the boat's sides, were used in 1828, and were fixed to a boat at Ouseburn-on-Tyne. The first iron outriggers were affixed to a boat in 1830 at Dents' Hole on Tyne. In 1844 Clasper, who had been improving upon these inventions, made his first boat of the kind and brought her to London; but her outriggers were only 8 inches in length, and she was built of several strakes, with a small keel. In process of time keels were dispensed with, the outriggers were lengthened, and the skin of the boat is now composed of a single strake of cedar planed very thin and bent by means of hot water to take the form of the timbers of the boat. It is fastened by copper nails to curved timbers of ash, one extremity of which is fixed into the keelson while the other is made fast to long pieces of deal that run from end to end of the boat and are called inwales. The timbers in the middle are thicker than the rest, so as to support the iron outriggers which are fastened to them, and the thwart, which is wider than it used to be in order to carry the sliding seat, which works backward and forward with the oarsman, is screwed to the inwales. This seat moves to and fro on rollers made of steel, wood, or brass, and travels over a distance varying from 12 to 6 inches according to the judgment of the instructor. The sliding seat seems to have been the invention of an American oarsman, who fixed one to a sculling boat in 1857, but it was not until 1870 that he had mastered the principles sufficiently to discover how much was gained mechanically and physically. The value of the improvement is now universally recognized, but it was some little time before it was understood and came into general use. The members of the London Rowing Club, who defeated the representatives of the New York Atalanta Club at Putney in June 1872, used sliding seats, and the club also had them fitted to their eight, which easily carried off the Grand Challenge cup at Henley a few days afterwards. In 1873 the sliding seat was adopted by the crews rowing in the University boat race. The Americans have also the credit of two other inventions, viz., the steering apparatus, which enables a crew to dispense with a coxswain, and the swivel rowlock; but, though the former is now fitted to the majority of non-coxswain pairs and fours, the use of the latter is confined for the most part to sculling boats. In outrigger eights, fours, and pairs the outriggers are placed, one for each thwart, at each side alternately, but in gigs, skiffs, wherries, and funnies they are placed opposite one another, so as to be used on either side at discretion. The oars generally used are about 12 feet long, varying with the width of the boat, and sculls are as much as 10 feet long.

Directions for Rowing.—In modern rowing the oarsman, grasping the handle of the oar with both hands, sits forward on the edge of his seat, stretches out his arms until they are fully extended—the blade of the oar being, just previous to entering the water, at right angles to its surface. It is then dipped into the water just so far as to cover it, and the handle pulled towards the oarsman's body, the weight of the latter being thrown backward at the same time, so as to make one movement, and the legs pressed hard against the stretcher, and the handle finally pulled home to the chest with the arms, the elbows being allowed to pass the sides until the handle of the oar just touches the lower extremity of the breast. The blade of the oar thus appears to be forced through the water, but in reality this is very slightly the case, as the water, which is the fulcrum, remains almost immovable. In sculling, the operation is the same except that the sculler has a scull in each hand and drives the boat himself, whereas a man rowing an oar must have one or more comrades to assist him. Rowing is made up of two parts, the stroke and the feather. Feathering is turning the oar at the end of the stroke by lowering the hands and dropping the wrists, thus bringing the flat blade of the oar parallel with the surface of the water, and is generally considered to include the driving forward of the handle of the oar and the consequent carrying back of the blade previous to the beginning of a new stroke.

When prepared to embark, the pupil should lay his oar on the water if an outside or upon the land if a shoreside oar, and step into the boat with his face to the stern, when he should at once seat himself and ship his oar, and then try the length of his stretcher to see that it suits his length of leg. This arranged, he should

proceed to settle himself firmly upon his thwart, sitting quite square and upright but not too near the edge of it, because if so the chances are that the lower part of the back will not be straight, and if his seat is not firm he cannot aid in balancing the boat. He should sit about three quarters of the thwart aft in an ordinary racing boat, about an inch and a half from the edge, and he must be exactly opposite the handle of his oar. His feet must be planted firmly against the stretcher and immediately opposite his body and oar,—the heel as well as the ball of the foot pressing against the stretcher, and the two heels close together with the toes wide apart, so as to keep the knees open and separate. Of course if the pupil sits fair and square, and immediately opposite the handle of his oar, he will be at one side and not in the centre of the boat. The stretcher, it may be added, should be as short as possible conveniently for clearing the knees and for exercising complete control over the oar. The body should be upright, not bent forward and sunk down upon the trunk; the shoulders should be thrown back, the chest out, and the elbows down close alongside the flanks. The oar should be held firmly, but withal lightly, in both hands, not clutched and cramped as in a vice—the outside hand close to the end of the handle, with the fingers above and the thumb underneath it, and the inside hand, or that nearest the body of the oar, from an inch and a half to 2 inches away from its fellow, but grasping the oar more convexly than the latter, the thumb being kept underneath. The forearms should be below the level of the handle, and the wrists dropped and relaxed, the oar lying flat and feathered upon the surface of the water. The diverse positions of the two hands and wrists enable the oar to be wielded with greater facility than if they were alike, and allow both arms to be stretched out perfectly straight, a crooked arm being perhaps the least pardonable fault in rowing. In taking the stroke the body should be inclined forwards with the backbone straight, the stomach well out and down between the legs, the chest forward and elevated as much as possible. The knees must be pressed slightly outwards; and the shoulders should come moderately forward, but perfectly level, and at an equal height. The arms should play freely in the shoulder joints, and should be perfectly straight from the shoulders to the wrists; the action of the hips also should be free. The inside wrist, however, must be somewhat raised, and the outside one bent slightly round, in order that the knuckles may be parallel to the oar, and the oar itself be firmly grasped with both hands, not with the tips of the fingers but with the whole of the fingers well round it, and each one feeling the handle distinctly; the knuckles of the thumbs should be about an inch and a half or 2 inches apart. In reaching forward the hands should be shot out straight from the body without the least pause, and as soon as the oar has passed the knees the wrists should be raised to bring the blade at right angles to the water preparatory to dipping it, and when the arms are at their extreme limit, which will be just over the stretcher, the oar should be struck down firmly and decisively into the water until covered up to the shoulder, and the weight of the body be thrown entirely upon it, by which the beginning of the stroke is caught, and the stroke itself pulled through; in a word, the pupil should, as it were, knit himself up, and then spring back like a bow when the string is loosened, bringing the muscles of his back and legs into play. The stroke should be finished with the arms and shoulders, the elbows being kept close to the sides, and the shoulders down and back, the head still up, and the chest out, and the oar itself be brought straight home to the chest, the knuckles touching the body about an inch or less below the bottom of the breast bone where the ribs branch off; when there the hands should be dropped down and then turned over, and shot out again close along the legs, the body following at once. Care should likewise be taken not to lessen the force applied to the oar as the stroke draws to a conclusion, but to put the whole strength of the arms and shoulders into the finish of the stroke, where it will naturally diminish quite fast enough, as the oar forms an obtuse angle with that portion of the boat before the rowlock. To effect a quick recovery the back must be kept straight, the knees must not be dropped too low, and the muscles of the body, especially of the stomach, must be used to enable the pupil to get forward for the next stroke. At the same time, no matter how minute and precise written instructions may be, they can never impart the knowledge that can be picked up by watching the actions of an accomplished oarsman for the space of five minutes; hence the imperative necessity of a practical exponent of the principles of the art in contradistinction to a merely theoretical "coach."

The foregoing are the essentials of rowing, and have been given at some length and in detail as the motions are necessarily very complicated. The operations are much the same whether a person be rowing on a fixed or sliding seat, but a novice should be taught to row on a fixed seat, and he will afterwards be easily able to acquire the art of sliding, which may soon be done from following the accompanying directions. The oarsman, in getting forward, should extend his arms to their full length, and with the assistance of the straps on the stretcher, simultaneously draw himself as close up to the latter as he can, his knees being slightly and symmetrically opened, and the body reached forward as much as possible, the

back being kept quite straight. On catching hold of the water, the knees must be gradually straightened and the body thrown back, the two actions going on simultaneously, so that the legs are straight out by the time the stroke is finished and not before, the body and shoulders at the end of the stroke being thrown well back. The body is then recovered to the upright position from the hips, the hands thrown forward, and by the time they are just past the knees the body is being drawn forward, and the knees bent. The motion then begins the same as before. (E. D. B.)

Boat-Racing in America.—This pastime can be traced back to the beginning of the present century. The earliest important affair was in 1811,—a sectional match, New York City against all Long Island, four-oared barges, with coxswains, from Harsimus, New Jersey, to the flag-staff on the Battery. New York won easily, and such was the popular enthusiasm over the race that its boat, the "Knickerbocker," was suspended in a public museum, where it remained for fifty-four years, a constant recipient of public admiration until destroyed by fire in July 1865. Since this historic contest no year has been without boat races. At that time the words amateur and professional were unknown on the water; the Castle Garden Amateur Boat Club Association—America's first avowedly amateur club—was founded in 1834.

There had been informal clubs and desultory racing at Yale College as early as 1833, but the first regular organization was in March 1843. Harvard followed in September 1844, and Yale and Harvard first met on the water at Lake Winnepesaukee, New Hampshire, August 3, 1852; since 1878 they have met annually at New London, Conn. In 1865 Harvard, Yale, Trinity, and Brown formed the Union College Regatta Association, which lasted three years. The Racing Association of American Colleges, which at one time included sixteen colleges, died in 1876. In 1883 Bowdoin, Columbia, Cornell, Princeton, Rutgers, University of Pennsylvania, and Wesleyan formed the Intercollegiate Racing Association, which still flourishes and gives annual regattas.

The control of amateur racing in America belongs to the National Association of Amateur Oarsmen, founded in 1873, whose membership includes all the better class of amateur boat clubs. Its management is vested in an Executive Committee of nine members, three of whom are elected at each annual meeting of the association. The rulings of this committee are subject to review, approval, or reversal, at each annual meeting of the full association. This association gives an annual open amateur regatta, similar to the Royal Henley Regatta in being the chief aquatic event of the year, but unlike it in not being rowed always on the same course, but moving about from year to year—having, since 1873, been rowed at Philadelphia, Newark, Troy, and Watkins (N.Y.), Detroit, Washington, and Boston. There are in the United States eleven regularly organized amateur rowing associations, formed by the union of amateur rowing clubs and giving each year one or more regattas. These associations are the National Association of Amateur Oarsmen, the North-Western Amateur Rowing Association, the Mississippi Valley Amateur Rowing Association, the Passaic River Amateur Rowing Association, the Intercollegiate Rowing Association, the Harlem Regatta Association, the Louisiana State Amateur Rowing Association, the Virginia State Rowing Association, the Schuylkill Navy, the Upper Hudson Navy, and the Kill von Kull Regatta Association. At English regattas it is usual to start three boats in a heat, sometimes four, five being the utmost limit, whereas at Saratoga, in the great regattas of 1874 and 1875, there were started abreast, in four separate races, eleven singles (twice), thirteen coxswainless fours, and thirteen coxswainless sixes.

The primary division of American racing craft is into (a) lap-streaks or clinkers, built of wood in narrow streaks with overlapping edges at each joint, and (b) smooth bottoms, made of wood or paper, and having a fair surface, without projecting joint or seam. Lap-streak boats are, however, now rarely used save in barge races. Then follows the subdivision into barges, which are open inrigged boats, gigs, which are open outriggered boats, and shells, which are covered outriggered boats. These three classes of boats are further subdivided, in accordance with the means of propulsion, into single, double, and quadruple sculling boats, and pair-, four-, six-, and eight-oared boats. In America the double-screw is more frequent than the pair, and the six-oar much more common than the eight-oar.

The sliding seat is now being gradually superseded by various styles of rolling seats, in which the actual seat travels backward and forward on frictionless wheels or balls. The best of these devices run more easily, are cleaner, and less liable to accident than the ordinary sliding seat. English oarsmen use the sliding seat as a means of making their old accustomed stroke longer and more powerful. American oarsmen hold that what is needed by an oarsman is not the addition of the long slide to the old-fashioned long swing, but the almost total substitution of slide for swing, the transfer of the labour from back to legs—in fact, a totally new style.

ROWLANDSON, THOMAS (1756–1827), caricaturist, was born in Old Jewry, London, in July 1756, the son of a tradesman or city merchant. It is recorded that "he could

make sketches before he learned to write," and that he covered his lesson-books with caricatures of his masters and fellow-pupils. On leaving school he became a student in the Royal Academy. At the age of sixteen he resided and studied for a time in Paris, and he afterwards made frequent tours on the Continent, enriching his portfolios with numerous jottings of life and character. In 1775 he exhibited at the Royal Academy a drawing of Delilah visiting Samson in Prison, and in the following years he was represented by various portraits and landscapes. Possessed of much facility of execution and a ready command of the figure, he was spoken of as a promising student; and had he continued his early application he would have made his mark as a painter. But he was the victim of a disastrous piece of good fortune. By the death of his aunt, a French lady, he fell heir to a sum of £7000, and presently he plunged into the dissipations of the town. Gambling became a passion with him, and he has been known to sit at the gaming-table for thirty-six hours at a stretch. In time poverty overtook him; and the friendship and example of Gillray and Bunbury seem to have suggested that his early aptitude for caricature might furnish a ready means of filling an empty purse. His drawing of Vauxhall, shown in the Royal Academy exhibition of 1784, had been engraved by Pollard, and the print was a success. Rowlandson was largely employed by Rudolph Ackermann, the art publisher, who in 1809–1811 issued in his *Poetical Magazine* "The Schoolmaster's Tour"—a series of plates with illustrative verses by Dr William Coombe. They were the most popular of the artist's works. Again engraved by Rowlandson himself in 1812, and issued under the title of the Tour of Dr Syntax in Search of the Picturesque, they had attained a fifth edition by 1813, and were followed in 1820 by Dr Syntax in Search of Consolation, and in 1821 by the Third Tour of Dr Syntax, in Search of a Wife. The same collaboration of designer, author, and publisher appeared in the English Dance of Death, issued in 1814–16, one of the most admirable of Rowlandson's series, and in the Dance of Life, 1822. Rowlandson also illustrated Smollett, Goldsmith, and Sterne, and his designs will be found in *The Spirit of the Public Journals* (1825), *The English Spy* (1825), and *The Humourist* (1831). He died in London, after a prolonged illness, on the 22d April 1827.

Rowlandson's designs were usually executed in outline with the reed-pen, and delicately washed with colour. They were then etched by the artist on the copper, and afterwards aqua-tinted—usually by a professional engraver, the impressions being finally coloured by hand. As a designer he was characterized by the utmost facility and ease of draughtsmanship. He poured forth his designs in ill-considered profusion, and the quality of his art suffered from this haste and over-production. He was a true if not a very refined humorist, dealing less frequently than his fierce contemporary Gillray with politics, but commonly touching, in a rather gentle spirit, the various aspects and incidents of social life. His most artistic work is to be found among the more careful drawings of his earlier period; but even among the gross forms and exaggerated caricature of his later time we find, here and there, in the graceful lines of a figure or the sweet features of some maiden's face, sufficient hints that this master of the humorous might have attained to the beautiful had he so willed.

See J. Grego, *Rowlandson the Caricaturist, a Selection from his Works*, &c. (2 vols., 1880).

ROWLEY, WILLIAM, actor and dramatist, collaborated with several of the celebrated dramatists of the Elizabethan period—Dekker, Middleton, Heywood, Fletcher, Webster, Massinger, and Ford. Nothing is known of his life except that he was an actor in various companies, and married in 1637. There was another Rowley, an actor and playwright in the same generation, Samuel, and probably a third, Ralph. Four plays by W. Rowley are extant,—*A Woman never Vext* (printed 1632), *A Match at Midnight* (1633), *All's Lost by Lust* (1633), and *A Shoemaker a*

Gentleman (1638). From these an opinion may be formed of his individual style. Effectiveness of situation and ingenuity of plot are more marked in them than any special literary faculty, from which we may conjecture why he was in such request as an associate in play-making. There are significant quotations from two of his plays in Lamb's *Specimens*. It is recorded by Langbaine that he "was beloved of those great men Shakespeare, Fletcher, and Jonson"; and the tradition of his personal amiability is supported by the fact of his partnerships with so many different writers.

ROWLEY REGIS, an urban sanitary district of Staffordshire, is situated on the Birmingham Canal, and on the Stourbridge branch of the Great Western Railway, 6 miles west of Birmingham. The original village surrounds the parish church, dating from the 13th century, but rebuilt in 1840 with the exception of the tower, which was also rebuilt in 1858. The village is situated in a rich coal and ironstone district, and round it numerous hamlets have grown up within recent years. Lately the parish has been erected into an urban sanitary district, governed by a local board of fifteen members. Besides collieries, iron works, and extensive quarries for "Rowley rag" (a basaltic intrusion), there are potteries, rivet, chain, and anchor works, breweries, and agricultural implement works, the district being one of the most important manufacturing centres of Staffordshire. The population of the urban sanitary district (area 3670 acres) in 1871 was 23,534 and in 1881 it was 27,385.

ROXANA, or ROXANE, daughter of the Bactrian Oxyartes and wife of Alexander the Great (see ALEXANDER, vol. i. p. 484, and MACEDONIAN EMPIRE, vol. xv. p. 142).

ROXBURGH, a border county of Scotland, occupying the greater part of the border line with England, is bounded E. and S.E. by Northumberland, S.E. by Cumberland, S.W. by Dumfriesshire, W. by Selkirkshire, N.W. by Midlothian, and N.E. by Berwickshire. It lies between 55° 6' 30" and 55° 42' 30" N. lat., and between 2° 10' and 3° 7' W. long. Its greatest length from north to south is 43 miles, and its greatest breadth about 30 miles. The area is 428,464 acres, or about 670 square miles.

Surface and Geology.—The greater part of Roxburgh is included in Teviotdale. The whole course of the Teviot, 40 miles in length, is included within the county. It rises in the ranges of greywacke hills which separate the county from Dumfriesshire and Selkirk, and runs north-eastwards, following the deposition of the greywacke rocks to the Tweed at Kelso, and dividing the county into two unequal parts. On the north a high range of land runs parallel with its banks and slopes to its margin. South-west between Dumfries and Cumberland the greywacke formation constitutes an almost continuous succession of eminences, through which the Liddel finds its way southwards. The highest summits of the greywacke ranges exceed 1800 feet. Although occasionally rocky and rugged, the hills are for the most part rounded in outline and clothed with grass to their summits. This Silurian formation occupies nearly the whole of the western half of the county, but along with the greywacke rocks is associated clay slate of a bluish colour, glimmering with minute scales of mica and frequently traversed by veins of calcareous spar. The formation is succeeded to the eastward by an extensive deposit of Old Red Sandstone, forming an irregular quadrangular area towards the centre of the county, emitting two irregular projections from its southern extremity, and interrupted towards the north by an intrusion of trap rocks. Owing to the sandstone formation the transverse valleys formed by various affluents of the Teviot present features of great interest. The action of the water has scooped deep channels in the rock, and thus formed picturesque narrow defiles, of which the high sandstone scours are a pro-

minent characteristic, their dark red colour blending finely with the bright green woods and sparkling streams. The best example of this species of scenery is on the Jed near Jedburgh. From the left the Teviot receives the Borthwick and the Ale, both rising in Selkirkshire, and from the right the Allan, the Slitrig, the Rule, the Jed, the Oxnam, and the Kale, which rise in the high grounds towards the English border. As the Teviot approaches Hawick the county becomes more cultivated, although frequent irruptions of igneous rocks in the shape of isolated hills lend to it picturesqueness and variety. Towards the Tweed, where the lower division of the coal formation prevails, it expands into a fine champaign country, richly cultivated and finely wooded. The Tweed, which enters the county about two miles north of Selkirk, crosses its northern corner, eastwards by Abbotsford, Melrose, and Kelso to Coldstream. Its tributaries within the county are, besides the Teviot, the Gala, the Leader, and the Eden. One of the principal features of the Tweed district is the beautiful group of the Eildon Hills near Melrose, consisting of felspathic porphyry, the highest of the three peaks reaching 1385 feet. The extensive range of the Cheviots running along the Northumberland border is of similar formation. Within Roxburghshire they reach a height of over 2400 feet. The lochs are comparatively few, the principal being Yetholm or Primside Loch, and Hoselaw in Linton parish.

The principal minerals are calcareous spar and quartz. The spar is frequently of a red or rose character indicating the presence of hematite. In the greywacke strata fossils are very rare, but in the Old Red Sandstone fossil fishes of the genus *Pterichthys* and *Holoptychius* are very numerous, and a great variety of plant impressions have been found, especially fucoids, but also vegetables of a higher origin, including distinct petrifications of *Calamites*.

Climate and Agriculture.—The mean annual temperature approximates to that of Scotland generally, but it is much warmer in the low and arable portions, where also the rainfall is much less than in the hilly regions. The soil varies much in different districts, being chiefly loam in the low and level tracts along the banks of the river, where it is also very fertile. In other parts a mixture of clay and gravel prevails, but there is also a considerable extent of mossy land. The hilly district is everywhere covered by a thick green pasture admirably suited for sheep. Both in the pastoral and in the arable districts agriculture is in a very advanced condition. The chief attention is devoted to cattle and sheep rearing.

Of the total area of 428,464 acres, 184,196 were in crops in 1885, 48,506 being under corn crops, 23,385 green crops, 59,937 clover, 47,058 permanent pasture, and 310 fallow. Of the area under corn crops, 82,624 acres, or fully two-thirds, were occupied by oats, and 13,355 acres by barley. Turnips and swedes were the principal green crops, occupying 25,143 acres, while potatoes occupied only 2118. The total number of horses was 4420, of which 3697 were used solely for purposes of agriculture; of cattle 17,831, of which 5154 were cows and heifers in milk or in calf; of sheep 502,721; and of pigs 4783. The valued rental in 1674 was £314,633 Scots, or £26,219 sterling, while that in 1883-84 was £420,403 including railways. According to the parliamentary return of lands and heritages, the total number of owners was 2455, of whom 1880 possessed less than one acre. The duke of Buccleuch possessed 104,461 acres, or nearly a fourth of the whole; the duke of Roxburghe, 50,459; the countess of Home, 25,380; marquis of Lothian, 19,740; and Sir William F. Elliot of Stobs, 16,475.

Manufactures.—Though essentially an agricultural county, Roxburghshire possesses woollen manufactures of some importance, including tweeds, blankets, shawls, and hosiery, the principal seats being Hawick, Jedburgh, and Kelso.

Railways.—The county is intersected by one of the lines of railway from Edinburgh to London (the "Waverley" route), which passes Melrose and Hawick. At Riccarton a branch passes south-eastwards to Newcastle. The northern district is crossed by the border railway from St Boswells to Kelso, Coldstream, and Berwick, a branch passing south from near Kelso to Jedburgh.

Population.—Between 1831 and 1881 the population increased from 43,663 to 53,442 (25,436 males, 28,006 females), but from 1861 to 1871 there was a decrease from 54,119 to 49,407. The town population numbered 24,273 in 1881, the village 6627, and the rural 22,542. Jedburgh (population 2482) is a royal burgh; it is also a police and parliamentary burgh, as is likewise Hawick

(16,184); Kelso (4637) is a police burgh. The most important villages are Melrose (1550), Newcastleton (924), and Yetholm (746).

History and Antiquities.—Among the more important relics of the early inhabitants of the county are the so-called Druidical remains at Tinnishill between the parishes of Castleton and Canonbie, at Ninestanerigg near Hermitage Castle, and at Plenderleath between the Oxnam and the Kale. Of old forts there are two of great size on the summits of Caerby and Tinnishill in Liddesdale, and a number of smaller ones in different parts of the county. On the north-west of the Eildon Hills are two fossæ or ramparts forming a circuit of more than a mile. On Caldsheels Hill there was another British fort, and between them a ditch with rampart of earth defending the country from the east. The famous Catrail, "partition of the fence," the most important of the British remains in the kingdom, extended a distance of 45 miles from near Galashiels in Selkirkshire through Roxburgh to Peel Fell on the border. The Roman Watling Street touched on Roxburgh at Broomhartlaw, whence passing along the mountains now forming the boundary of the county for a mile and a half, until it entered Scotland at Blackhall, it turned northward by Bonjedward, Mount Teviot, Newton, Eildon, and Newstead to Channellkirk in the Lammermuirs. On its line there were important stations at Chewgreen in the Cheviots (? *Ad Fines*), Bonjedward (*Gadonica*), and Eildon Hill (? *Trimontium*). Another Roman road called the Maidenway from Maiden Castle in Westmoreland entered Roxburgh at Deadwater, and under the name of the Wheelcauseway traversed the north-east corner of Liddesdale into Teviotdale. From Watling Street a branch called the Devil's Causeway passed to the Tweed. After forming part of the kingdom of Northumberland for several centuries, Roxburgh was relinquished along with Lothian to the Scottish king about 1020 (see *LOTHIAN*, vol. xv. p. 10). It is supposed to have been formed into a shire in the reign of David I., its ancient county town of Roxburgh forming, along with Edinburgh, Berwick, and Stirling, the court of the four burghs of Scotland, whose laws were collected by that king. Roxburgh Castle, between the Tweed and Teviot near Kelso, was a royal residence of the Saxon kings of Northumbria and afterwards of the Scottish monarchs. It was frequently taken by the English, and James II. was killed there by the bursting of a cannon. After this it remained in ruins till it was repaired by Protector Somerset, shortly after which it was demolished. Hermitage, in Liddesdale, the scene of Leyden's ballad of *Lord Soulis*, was probably built by Nicholas de Sules in the beginning of the 13th century. On the forfeiture of the Soulis family in 1320, it was granted by Robert the Bruce to Sir John Graham of Abercorn, and passed by the marriage of his heiress Mary to her husband William Douglas, knight of Liddesdale, who starved Sir Alexander Ramsay of Dalhousie to death in it in 1342 in revenge for Ramsay's appointment as sheriff of Roxburgh by David II. In 1492 Archibald Douglas, fifth earl of Angus, exchanged the Hermitage for Bothwell Castle, on the Clyde, with Patrick Hepburn, first earl of Bothwell; and it was there that his descendant, the fourth earl, was visited in 1566 by Mary queen of Scots. The principal of the other old castles are Branxholm on the Teviot, long the residence of the Buccleuchs and the scene of Sir Walter Scott's *Lay of the Last Minstrel*; Cessford, on a ridge inclining towards the Kale, formerly of great strength, besieged in 1520 by Surrey, to whom it surrendered; and Ferniehirst, the mansion of the Kers, on the Jed, occupying the site of a baronial fortress erected in 1410, and the scene of many a fray. The district was for a long time the scene of continual border conflicts, the leaders in which were the Armstrongs and other chiefs occupying the fortresses or peels, chiefly in Liddesdale, as at Gilknockie, Castleton, Whitehaugh, Copshaw, Syde, Mangerton, Goranberry, Hartsgarth, and Newcastleton. Among many fine modern mansions mention may be made of Floors Castle, the seat of the duke of Roxburghe; Minto House, the seat of the earl of Minto; and Abbotsford, built by Sir Walter Scott. Few counties can boast of such important ecclesiastical remains as those of the abbeys of Melrose, Jedburgh, and Kelso. There are several ancient crosses in the county, the principal being those at Ancrum, Bowden, Maxton, and Melrose. Among numerous eminent men connected with Roxburgh mention may be made of Samuel Rutherford the theologian, James Thomson, author of *The Seasons*, John Leyden the poet, and Sir Gilbert Elliot of Minto.

See Jeffery, *History of Roxburghshire*, 4 vols., 1857-64; Armstrong's *History of Liddesdale*, 1884. (T. F. H.)

ROXBURY, formerly a city of Norfolk county, Massachusetts, U.S., now incorporated in Boston (*q.v.*).

ROY, RÁMMOHUN (1774-1833). Rájá Rámmohun Roy (or Ráy), the founder of the Bráhma Samáj or Theistic Church of India, was born at Rádhanagar, Bengal, in May 1774, of an ancient and honourable Brahman family. His father gave him a good education; he learnt Persian at home, Arabic at Patna (where he studied Euclid, Aristotle, and the Koran), and Sanskrit at Benares. Although a devout idolater in boyhood, he early began to doubt and

speculate, and at fifteen left home to study Buddhism in Tibet, where his criticisms on the Lama-worship gave much offence. After some years' travel he returned, but, his anti-idolatrous sentiments obliging him to leave home, he lived at Benares until his father's death in 1803. After this, he spent about ten years in the East India Company's service, latterly as *dewán* or head officer in the collection of revenues.

During this period he first began to assemble his friends together for evening discussions on the absurdities of idolatry, and he also issued his first work, *Tuhfat al Munahhidin* ("A Gift to Monotheists"). This treatise was in Persian, with an Arabic preface, and was a bold protest against superstition and priestcraft. These proceedings brought on him much hostility, and even persecution, and in 1814 he retired to Calcutta for greater safety. Here he soon established a little Friendly Society (*Ātmīya Sabhā*), which met weekly to read the Hindu Scriptures and to chant monotheistic hymns. In 1816 he translated the Vedānta into Bengali and Hindustani, following this by a series of translations from the Upanishads into Bengali, Hindustani, and English, with introductions and comments of his own. These works he published at his own expense and disseminated widely among his countrymen. His writings excited much opposition and gave rise to numerous controversies, in which his ability, tact, and learning rendered him fully a match for his antagonists. But the deadliest blow which he inflicted upon Hindu superstition was his effective agitation against the rite of suttee, the burning of living widows on the funeral piles of their deceased husbands. In 1811 he had been a horrified witness of this sacrifice in his elder brother's family, and had vowed never to rest until he had uprooted the custom. He exposed the hollow pretences of its advocates in elaborate pamphlets, both in Bengali and English, and pressed the matter in every possible way, till at last the tide of public feeling turned, and on December 4, 1829, Lord William Bentinck issued a regulation abolishing suttee throughout all the territories subject to Fort William. Rāmmohun was an active politician and philanthropist. He built schoolhouses and established schools in which useful knowledge was gratuitously taught through the medium both of the English and the native languages. He wrote a suggestive Bengali grammar, of which he published one version in English (1826) and one in Bengali (1833). He wrote valuable pamphlets on Hindu law, and made strenuous exertions for the freedom of the native press; he also established (1822) and mainly conducted two native newspapers, the *Sambād Karmudī* in Bengali, and (if rightly identified) the *Mirāt al-Akhbār* in Persian, and made them the means of diffusing much useful political information. Becoming interested in Christianity, he learned Hebrew and Greek in order to read the Bible in the original languages; and in 1820 he issued a selection from the four Gospels entitled *The Precepts of Jesus, the Guide to Peace and Happiness*. This was attacked by the Baptist missionaries of Serampur, and a long controversy ensued, in which he published three remarkable *Appeals to the Christian Public in Defence of the "Precepts of Jesus."* He also wrote other theological tracts (sometimes under assumed names) in which he attacked both Hindu and Christian orthodoxy with a strong hand. But his personal relations with orthodox Christians were never unfriendly, and he rendered valuable assistance to Dr Duff in the latter's educational schemes. He also warmly befriended a Unitarian Christian Mission which was started in Calcutta (1824) by Mr William Adam, formerly a Baptist missionary, who, in attempting to convert Rāmmohun to Trinitarianism, had himself been converted to the opposite view. This Unitarian Mission,

though not a theological success, attracted considerable sympathy among the Hindu monotheists, whose *Ātmīya Sabhā* had then become extinct. At last Rāmmohun felt able to re-embody his cherished ideal, and on August 20, 1828, he opened the first "*Brāhmya Association*" (*Brahma Sabhā*) at a hired house. A suitable church building was then erected and placed in the hands of trustees, with a small endowment and a remarkable trust-deed by which the building was set apart "for the worship and adoration of the Eternal, Unsearchable, and Immutable Being who is the Author and Preserver of the universe." The new church was formally opened on the 11th Māgh (January 23) 1830, from which day the *Brāhma Samāj* dates its existence. Having now succeeded in his chief projects, Rāmmohun resolved to visit England, and the king of Delhi appointed him his envoy thither on special business, and gave him the title of *rājā*. He arrived in England on April 8, 1831, and was received with universal cordiality and respect. He watched with special anxiety the parliamentary discussions on the renewal of the East India Company's charter, and gave much valuable evidence before the Board of Control on the condition of India. This he republished with additional suggestions (*Exposition of the Practical Operation of the Judicial and Revenue Systems of India*), and also reissued his important *Essay on the Right of Hindus over Ancestral Property* (1832). He visited France, and wished to visit America, but died unexpectedly of brain fever at Bristol, September 27, 1833.

His Bengali and Sanskrit works were lately reissued in one volume, by Rājnarāin Bose and A. C. Vedāntabāgish (Calcutta, 1880), and his English works will shortly be published in two volumes by Eshanchandra Bose. Nagendranāth Chattopādhyāy's Bengali memoir of him (1881) is the fullest yet published.

ROY, WILLIAM (c. 1726–1790), a famous geodesist, was employed in some of the great national trigonometrical measurements which were made during last century. In 1746, at the age of twenty, when an assistant in the office of Colonel Watson, deputy quartermaster-general in North Britain, he began the survey of the mainland of Scotland, the results of which were embodied in what is known as the "duke of Cumberland's map." In 1756 he obtained a lieutenancy in the 51st regiment, and proceeded with it to Germany, where his talents as a military draughtsman brought him to notice, and procured him rapid promotion. He ultimately reached the rank of major-general. In 1784, while deputy quartermaster-general at the Horse Guards, his services were called into request for conducting the observations for determining the relative positions of the French and English royal observatories. His measurement of a base line for that purpose on Hounslow Heath in 1784, which was destined to be the germ of all subsequent surveys of the United Kingdom, gained him the gold medal of the Royal Society of London. Owing to unforeseen delays, the triangulation for connecting the meridians of the two observatories was not carried out until 1787. He had completed his undertaking, and was finishing an account of it for the *Phil. Trans.* when he died in 1790.

Besides several papers in *Phil. Trans.*, Roy was author of the work entitled *Military Antiquities of the Romans in North Britain*, published in 1793.

ROYAL HOUSEHOLD. In all the mediæval monarchies of western Europe the general system of government sprang from, and centred in, the royal household. The sovereign's domestics were his officers of state, and the leading dignitaries of the palace were the principal administrators of the kingdom. The royal household itself had, in its turn, grown out of an earlier and more primitive institution. It took its rise in the *comitatus* described by Tacitus, the chosen band of *comites* or companions who, when the Roman historian wrote, constituted the personal following, in peace as well as in war, of the Teutonic

princeps or chieftain. In England before the Conquest the *comitatus* had developed or degenerated into the thegnhood, and among the most eminent and powerful of the king's thegns, were his dishthegn, his bowerthegn, and his horsethegn or staller. In Normandy at the time of the Conquest a similar arrangement, imitated from the French court, had long been established, and the Norman dukes, like their overlords the kings of France, had their seneschal or steward, their chamberlain, and their constable. After the Conquest the ducal household of Normandy was reproduced in the royal household of England; and since, in obedience to the spirit of feudalism, the great offices of the first had been made hereditary, the great offices of the second were made hereditary also, and were thenceforth held by the grantees and their descendants as grand-serjeanties of the crown. The consequence was that they passed out of immediate relation to the practical conduct of affairs either in both state and court or in the one or the other of them. The steward and chamberlain of England were superseded in their political functions by the justiciar and treasurer of England, and in their domestic functions by the steward and chamberlain of the household. The marshal of England took the place of the constable of England in the royal palace, and was associated with him in the command of the royal armies. In due course, however, the marshalship as well as the constableness became hereditary, and, although the constable and marshal of England retained their military authority until a comparatively late period, the duties they had successively performed about the palace had been long before transferred to the master of the horse. Under these circumstances the holders of the original great offices of state and the household ceased to attend the court except on occasions of extraordinary ceremony, and their representatives either by inheritance or by special appointment have ever since continued to appear at coronations and some other public solemnities, such as the opening of the parliament or trials by the House of Lords.¹

The materials available for a history of the royal household are somewhat scanty and obscure. The earliest record relating to it is of the reign of Henry II., and is contained in the *Black Book of the Exchequer*. It enumerates the various inmates of the king's palace and the daily allowances made to them at the period at which it was compiled. Hence it affords valuable evidence of the antiquity and relative importance of the court offices to which it refers, notwithstanding that it is silent as to the functions and formal subordination of the persons who filled them.² In addition to this record we have a series of far later, but for the most part equally meagre, documents bearing more or less directly on the constitution of the royal household, and extending, with long intervals, from the reign of Edward III. to the reign of William and Mary.³ Among them, however, are what are known as the

Black Book of the Household and the *Statutes of Eltham*, compiled the first in the reign of Edward IV. and the second in the reign of Henry VIII., from which a good deal of detailed information may be gathered concerning the arrangements of the court in the 15th and 16th centuries. The *Statutes of Eltham* were meant for the practical guidance merely of those who were responsible for the good order and the sufficient supply of the sovereign's household at the time they were issued. But the *Black Book of the Household*, besides being a sort of treatise on princely magnificence generally, professes to be based on the regulations established for the governance of the court by Edward III., who, it affirms, was "the first setter of certeynties among his domesticall meyne, upon a ground rule" and whose palace it describes as "the house of very policie and flowre of England;" and it may therefore possibly, and even probably, take us back to a period much more remote than that at which it was actually put together.⁴ Various orders, returns, and accounts of the reigns of Elizabeth, James I., Charles I., Charles II., and William and Mary throw considerable light on the organization of particular sections of the royal household in times nearer to our own.⁵ Moreover, there were several parliamentary inquiries into the expenses of the royal household in connexion with the settlement or reform of the civil list during the reigns of George III., George IV., and William IV.⁶ But they add little or nothing to our knowledge of the subject in what was then its historical as distinguished from its contemporary aspects. So much, indeed, is this the case that, on the accession of Queen Victoria, Chamberlayne's *Present State of England*, which contains a catalogue of the officials at the court of Queen Anne, was described by Lord Melbourne the prime minister as the "only authority" which the advisers of the crown could find for their assistance in determining the appropriate constitution and dimensions of the domestic establishment of a queen regnant.⁷

In its main outlines the existing organization of the royal household is essentially the same as it was under the Tudors or the Plantagenets. It is now, as it was then, divided into three principal departments, at the head of which are severally the lord steward, the lord chamberlain, and the master of the horse, and the respective provinces of which may be generally described as "below stairs," "above stairs," and "out of doors." But at present, the sovereign being a queen, the royal household is in some other respects rather differently arranged from what it would be if there were a king and a queen consort. When there is a king and a queen consort there is a

¹ *Liber Niger Domus Regis Edward IV. and Ordinances for the Household made at Eltham in the seventeenth year of King Henry VIII., A.D. 1526*, are the titles of these two documents. The earlier documents printed in the same collection are *Household of King Edward III. in Peace and War from the eighteenth to the twenty-first year of his reign*; *Ordinances of the Household of King Henry IV. in the thirty-third year of his reign, A.D. 1455*, and *Articles ordained by King Henry VII. for the Regulation of his Household, A.D. 1494*.

² *The Book of the Household of Queen Elizabeth as it was ordained in the forty-third year of her Reign delivered to our Sovereign Lord King James, &c.*, is simply a list of officers' names and allowances. It seems to have been drawn up under the curious circumstances referred to in *Archæologia* (vol. xii. pp. 80-85). For the rest of these documents see *Ordinances and Regulations, &c.*, pp. 299, 340, 347, 352, 363, and 380.

³ Burke's celebrated Act "for enabling His Majesty to discharge the debt contracted upon the civil list, and for preventing the same from being in arrear for the future, &c.," 22 Geo. III. c. 82, was passed in 1782. But it was foreshadowed in his great speech on "Economical Reform" delivered two years before. Since the beginning of the current century select committees of the House of Commons have reported on the civil list and royal household in 1803, 1804, 1815, and 1831.

⁴ *Torrens's Memoirs of William, second Viscount Melbourne*, vol. ii. p. 303.

¹ The great officers of state and the household whom we have particularly mentioned do not of course exhaust the catalogue of them. We have named those only whose representatives are still dignitaries of the court and functionaries of the palace. If the reader consults Hallam (*Middle Ages*, vol. i. p. 181 sq.), Freeman (*Norman Conquest*, vol. i. p. 91 sq., and vol. v. p. 426 sq.), and Stubbs (*Const. Hist.*, vol. i. p. 343, sq.), he will be able himself to fill in the details of the outline we have given above.

² The record in question is entitled *Constitutio Domus Regis de Procuracionibus*, and is printed by Hearne (*Liber Niger Scaccarii*, vol. i. p. 341 sq.). It is analysed by Stubbs (*Const. Hist.*, vol. i. note 2, p. 345).

³ *A Collection of Ordinances and Regulations for the Government of the Royal Household, made in Divers Reigns from King Edward III. to King William and Queen Mary*, printed for the Society of Antiquaries, London, 1790. See also Pegge's *Curialia*, published partly before and partly after this volume; and Carlisle's *Gentlemen of the Privy Chamber*, published in 1829. Pegge and Carlisle, however, deal with small and insignificant portions of the royal establishment.

separate establishment "above stairs" and "out of doors" for the queen consort. She has a lord chamberlain's department and a department of the master of the horse of her own, and all the ladies of the court from the mistress of the robes to the maids of honour are in her service. At the commencement of the reign of Queen Victoria the two establishments were combined, and on the whole considerably reduced. Hence the royal household, although it is of course much larger than that of a queen consort would be, is also appreciably smaller than that of a king and queen consort together has been since the reigning family came to the throne.¹

I. *Department of the Lord Steward of the Household.*—The hall; the kitchen, ewry, and pantry; the wine, beer, and coal cellars; and the almonry are in the lord steward's department. The lord steward is the first dignitary of the court, and presides at the Board of Green Cloth, where all the accounts of the household are examined and passed.² He is always a member of the Government of the day, a peer, and a privy councillor. He receives his appointment from the sovereign in person, and bears a white staff as the emblem and warrant of his authority.³ In his department the treasurer and comptroller of the household are the officers next in rank to him. They also sit at the Board of Green Cloth, carry white staves, and belong to the ministry. They are always peers or the sons of peers, and privy councillors. But the duties which in theory belong to the lord steward, treasurer, and comptroller of the household are in practice performed by the master of the household, who is a permanent officer and resides in the palace. It is he who really investigates the accounts and maintains discipline among the ordinary servants of the royal establishment. He is a white-staff officer and a member of the Board of Green Cloth but not of the ministry, and among other things he presides at the daily dinners of the suite in waiting on the sovereign.⁴ In the lord steward's department are the secretary and three clerks of the Board of Green Cloth; the coroner and paymaster of the household; and the officers of the almonry, namely, the hereditary grand almoner,⁵ the lord high almoner, the sub-almoner, the groom of the almonry, and the secretary to the lord high almoner.⁶

II. *Department of the Lord Chamberlain of the Household.*—The bedchamber, privy chamber, and presence chamber, the wardrobe, the housekeeper's room, and the guardroom, the metropolitan theatres, and the chapels royal are in the lord chamberlain's department. The lord chamberlain is the second dignitary of the court, and is always a member of the Government of the day, a peer, and a privy councillor. He carries a white staff, and wears a golden or jewelled key, typical of the key of the palace, which is supposed to be in his charge, as the ensigns of his office. He is responsible for the necessary arrangements connected with state ceremonies, such as coronations and royal marriages, christenings, and funerals. All invitations to court are sent out in his name by command of the sovereign, and at drawing rooms and levees he stands next to the sovereign and announces the persons who are approaching the throne. It is also part of his duty to conduct the sovereign to and from his or her carriage.⁷ The vice-chamberlain of the household is the lord chamberlain's assistant and deputy. He also is one of the ministry, a white-staff officer, and the bearer of a key; and he is always a peer or the son of a peer as well as a privy councillor.

When there is a king the groom of the stole comes next to the vice-chamberlain in rank and authority. At present, however, the mistress of the robes in some measure occupies the position of the groom of the stole.⁸ She is the only lady of the court who comes into office and goes out with the administration, and the duties she performs are merely occasional and formal. She is always a duchess, and attends the queen at all state ceremonies and entertainments, but is never in permanent residence at the palace.⁹ On the contrary the ladies of the bedchamber share the function of personal attendance on the sovereign throughout the year. Of these there are eight, always peeresses, and each is in waiting for about a fortnight or three weeks at a time. But the women of the bedchamber, of whom there are also eight, appear only at court ceremonies and entertainments according to a roster annually issued under the authority of the lord chamberlain. They are usually the daughters of peers or the wives of the sons of peers, and in the old time, like the mistress of the robes and the ladies of the bedchamber, habitually assisted the queen at her daily toilette. But this has long ceased to be done by any of them. The maids of honour, whose situations are by no means sinecures, are likewise eight in number and have the same terms of waiting as the ladies of the bedchamber. They are commonly if not always the daughters or granddaughters of peers, and when they have no superior title and precedence by birth are called "honourable" and placed next after the daughters of barons. The queen as a special mark of her favour nominates "extra" ladies and women of the bed-chamber and maids of honour. But their position is altogether honorary and involves no charge on the civil list. There are eight lords and eight grooms, who are properly described as "of the bed-chamber" or "in waiting," according as the reigning sovereign is a king or a queen, and whose terms of attendance are of similar duration to those of the ladies of the bedchamber and the maids of honour. Occasionally "extra" lords and grooms in waiting are nominated by the queen, who, however, are unpaid and have no regular duties. The master, assistant master, and marshal of the ceremonies are the officers whose special function it is to enforce the observance of the *etiquette* of the court. The reception of foreign potentates and ambassadors is under their particular care, and they assist in the ordering of all entertainments and festivities at the palace.¹⁰ The gentleman usher of the black rod—the black rod which he carries being the ensign of his office—is the principal usher of the court and kingdom. He is one of the original functionaries of the order of the Garter, and is in constant attendance on the House of Lords, from whom, either personally or by his deputy the yeoman usher of the black rod, it is part of his duty to carry messages and summonses to the House of Commons. The gentlemen ushers of the privy chamber and the gentlemen ushers daily waiters, of whom there are four each, and the gentlemen ushers quarterly waiters and the sergeants-at-arms, of whom there are eight each, are in waiting only at drawing rooms and levees and state balls and concerts. But of the sovereign's sergeants-at-arms there are two others to whom special duties are assigned, the one attending the speaker in the House of Commons, and the other attending the lord chancellor in the House of Lords, carrying their maces and executing their orders.¹¹ The yeomen of the guard date from the reign of Henry VII., and the gentlemen-at-arms from the reign of Henry VIII. The captain of each corps is always a member of the ministry and a peer. Besides the captains, the former, now called the queen's bodyguard, consists of a lieutenant, ensign, clerk of the cheque and adjutant, four exons, and a hundred yeomen; and the latter, once called the gentlemen pensioners, consists of a lieutenant, standard-bearer, clerk of the cheque and adjutant, a sub-officer, and forty gentlemen. The comptroller and examiner of accounts, the licenser of plays, the dean and subdean of the chapel royal, the clerk of the closet, the groom of the robes, the pages of the backstairs, of the chamber, and of the presence, the poet laureate, the royal physicians and surgeons, chaplains, painters and sculptors, librarians and musicians, &c., are all under the superintendence of the lord chamberlain of the household.¹²

III. *Department of the Master of the Horse.*—The stables and coachhouses, the stud, mews, and kennels, are in the master of the horse's department. The master of the horse is the third

¹ Hansard, *Parl. Debates*, vol. xxxix. pp. 146 sq. 1842 sq.

² In the *Statutes of Eltham* he is called "the lord great master," but in the *Household Book of Queen Elizabeth* "the lord steward," as before and since. In 31 Hen. VIII. c. 10, "for placing of the lords," he is described as "the grand master or lord steward of the king's most honourable household." The whole business of purveyance and pre-emption was anciently managed by the Board of Green Cloth. See under heading "The counting house of the king's household, *Domus Compotus Hospitii Regis*," in Coke, *Institutes*, iv. cap. 19. It is designated "the court of the virge or green cloth" in 22 Geo. III. c. 82, § 5.

³ In the old time the lord steward had three courts besides the board of green cloth under him, namely, the lord steward's court, the court of the Marshalsey, and the palace court (Coke, *Inst.*, iv. caps. 20 and 21; Reeves, *Hist. of the Law of England*, vol. ii. pp. 138 and 297; Stephen, *Commentaries on the Law of England*, vol. iv. p. 222). The lord steward or his deputies formerly administered the oaths to the members of the House of Commons, and frequent inconveniences were the consequence (see Hatsell, *Precedents of Proceedings in the House of Commons*, London, 1818, vol. ii. pp. 81–91). In certain cases now "the lords with white staves" are the proper persons to bear communications between the sovereign and the Houses or Parliament.

⁴ In the case of the master of the household we see history repeating itself. He is not named in the *Black Book* of Edward IV. or in the *Statutes* of Henry VIII., and is entered as "master of the household and clerk of the green cloth" in the *Household Book* of Queen Elizabeth. But practically he has superseded the lord steward of the household, as the lord steward of the household at one time superseded the lord high steward of England.

⁵ The marquess of Exeter.

⁶ In the lord steward's department the offices of cofferer of the household, treasurer of the chamber, paymaster of pensions, and six clerks of the Board of Green Cloth were abolished by 22 Geo. III. c. 82.

⁷ The lord chamberlain of the household at one time discharged some important political functions, which are described by Sir Harris Nicolas (*Proceedings of the Privy Council*, vol. vi., Preface, p. xxiii).

⁸ In the reign of Queen Anne, Sarah duchess of Marlborough from 1704, and Elizabeth duchess of Somerset from 1710, held the combined offices of mistress of the robes and groom of the stole.

⁹ Since the great "bedchamber question" of 1839 the settled practice has been for all the ladies of the court except the mistress of the robes to receive and continue in their appointments independently of the political connexions of their husbands, fathers, and brothers (see Mr Gladstone's *Gleanings of Past Years*, vol. i. p. 40; and Torrens's *Memoirs of Lord Melbourne*, vol. ii. p. 304).

¹⁰ The office of master of the ceremonies was created by James I. The master of the ceremonies wears a medal attached to a gold chain round his neck, on one side being an emblem of peace with the motto "Beati pacifici," and on the other an emblem of war with the motto "Dieu et mon droit" (see *Finetti Philoensis*, by Sir John Finett, master of the ceremonies to James I. and Charles I., 1656; and D'Israeli's *Curiosities of Literature*, 10th ed., p. 242 sq.).

¹¹ See May, *Parliamentary Practice*, pp. 286, 244.

¹² The offices of master of the great wardrobe and master of the jewel house in the lord chamberlain's department were abolished by 22 Geo. III. c. 82.

dignitary of the court, and is always a member of the Government of the day, a peer, and a privy councillor. All matters connected with the horses and hounds of the sovereign are within his jurisdiction. The master of the buckhounds, who is also one of the ministry, ranks next to him, and it is his duty to attend the royal hunt and to head the procession of royal equipages on the racecourse at Ascot, where he presents himself on horseback in a green and gold uniform wearing the couples of a hound as the badge of his office. The hereditary grand falconer¹ is also subordinated to the master of the horse. But the practical management of the royal stables and stud in fact devolves on the chief or crown equerry, formerly called the gentleman of the horse, who is never in personal attendance on the sovereign, and whose appointment is permanent. The clerk marshal has the supervision of the accounts of the department before they are submitted to the Board of Green Cloth, and is in waiting on the sovereign on state occasions only. Exclusive of the crown equerry there are seven regular equeries, besides extra and honorary equeries, one of whom is always in attendance on the sovereign and rides at the side of the royal carriage. They are always officers of the army, and each of them is "on duty" for about the same time as the lords and grooms in waiting. There are also three pages of honour in the master of the horse's department, who must not be confounded with the pages of various kinds who are in the department of the lord chamberlain. They are youths aged from twelve to sixteen, selected by the sovereign in person, to attend on her at state ceremonies, when two of them arrayed in an antique costume assist the groom of the robes in carrying the royal train.

It remains to be said that to the three ancient departments of the royal household which we have already noticed two others have been added in comparatively recent times. The departments of the private secretary and the keeper of the privy purse to the sovereign, which are for the present combined, assumed their existing shape no longer ago than the earlier part of the current century. Very great doubts were at one time entertained as to whether such an office as that of private secretary to the sovereign could constitutionally exist. As now organized these branches of the royal household consist of the private secretary and keeper of the privy purse, two assistant private secretaries and keepers of the privy purse, and a secretary and two clerks of the privy purse. By the statute which settled the civil list at the beginning of the current reign (1 & 2 Vict. c. 2) the privy purse was fixed at £60,000 a year, and the salaries, allowances, and other expenses of the royal household were fixed by the same statute at £303,760 a year. (F. DR.)

ROYAL SOCIETY, THE, or, more fully, The Royal Society of London for Improving Natural Knowledge, is an association of men interested in the advancement of mathematical and physical science. It is the oldest scientific society in Great Britain, and one of the oldest in Europe.

The Royal Society is usually considered to have been founded in the year 1660, but a nucleus had in fact been in existence for some years before that date. Wallis informs us that as early as the year 1645 weekly meetings were held of "divers worthy persons, inquisitive into natural philosophy, and other parts of human learning, and particularly of what hath been called the *New Philosophy* or *Experimental Philosophy*," and there can be little doubt that this gathering of philosophers is identical with the "Invisible College" of which Boyle speaks in sundry letters written in 1646 and 1647. These weekly meetings, according to Wallis, were first suggested by Theodore Haak, "a German of the Palatinate then resident in London," and they were held sometimes in Dr Goddard's lodgings in Wood Street, sometimes at the Bull-Head Tavern in Cheapside, but more often at Gresham College.

On November 28, 1660, the first journal book of the society was opened with a "memorandum," from which the following is an extract:—"Memorandum that Novemb. 28. 1660, These persons following, according to the usuall custom of most of them, mett together at Gresham Colledge to heare Mr Wren's lecture, viz., The Lord Brouncker, Mr Boyle, Mr Bruce, Sir Robert Moray, Sir Paul Neile, Dr Wilkins, Dr Goddard, Dr Petty, Mr Ball, Mr Rooke, Mr Wren, Mr Hill. And after the lecture was ended, they did, according to the usuall manner withdrawe for mutuall

converse. Where amongst other matters that were discoursed of, something was offered about a designe of founding a Colledge for the promoting of Physico-Mathematicall Experimentall Learning." It was agreed at this meeting that the company should continue to assemble on Wednesdays at 3 o'clock; an admission fee of ten shillings with a subscription of one shilling a week was instituted; Dr Wilkins was appointed chairman; and a list of forty-one persons judged likely and fit to join the design was drawn up. On the following Wednesday Sir Robert Moray brought word that the king (Charles II.) approved the design of the meetings; a form of obligation was framed, and was signed by all the persons enumerated in the memorandum of November 28, and by seventy-three others. On December 12 another meeting was held at which fifty-five was fixed as the number of the society,—persons of the degree of baron, fellows of the College of Physicians, and public professors of mathematics, physic, and natural philosophy of both universities being supernumeraries.

Gresham College was now appointed to be the regular meeting-place of the society. Sir Robert Moray was chosen president (March 6, 1661), and continued in that office until the incorporation of the society, when he was succeeded by Lord Brouncker. In October 1661 the king offered to be entered one of the society, and next year the society was incorporated under the name of "The Royal Society," the charter of incorporation passing the great seal on the 15th July 1662, to be modified, however, by a second charter in the following year. The council of the Royal Society met for the first time on May 13, 1663, when resolutions were passed that debate concerning those to be admitted should be secret, and that fellows should pay 1s. a week to defray expenses.

At this early stage of the society's history one main part of their labours was the "correspondence" which was actively maintained with Continental philosophers, and it was from this that the *Philosophical Transactions* (a publication now of world-wide celebrity) took its rise. At first the *Transactions* was entirely the work of the secretary, except that it was ordered (March 1, 1664–5) "that the tract be licensed by the Council of the Society, being first reviewed by some of the members of the same." The first number, consisting of sixteen quarto pages, appeared on Monday 6th March 1664–5. In 1750 four hundred and ninety-six numbers or forty-six volumes had been published by the secretaries. After this date the work was issued under the superintendence of a committee, and the division into numbers disappeared. At present (1885) one hundred and seventy-five volumes have been completed.

Another matter to which the society turned their attention was the formation of a museum, the nucleus being "the collection of rarities formerly belonging to Mr Hubbard," which, by a resolution of council passed February 21, 1666, was purchased for the sum of £100. This museum, at one time the most famous in London, was presented to the trustees of the British Museum in 1781, upon the removal of the society to Somerset House.

After the Great Fire of London in September 1666 the apartments of the Royal Society in Gresham College were required for the use of the city authorities, and the society were therefore invited by Henry Howard of Norfolk to meet in Arundel House. At the same time he presented them with the library purchased by his grandfather Thomas, earl of Arundel, and thus the foundation was laid of the magnificent collection of scientific works, probably not far short of 45,000 volumes, which the society at the present time possesses. Of the Arundel MSS. the bulk was sold to the trustees of the British Museum in 1830 for the sum of £3559, the proceeds being devoted

¹ The Duke of St Albans.

to the purchase of scientific books. These MSS. are still kept in the museum as a separate collection.

Under date December 21, 1671, the journal-book records that "the lord bishop of Sarum proposed for candidate Mr Isaac Newton, professor of the mathematicks at Cambridge." Newton was elected a fellow January 11, 1671-2, and in 1703 he was appointed president, a post which he held till his death in 1727. During his presidency the society moved to Crane Court, their first meeting in the new quarters being held November 8, 1710. In the same year they were appointed visitors and directors of the Royal Observatory at Greenwich, a function which they continued to perform until the accession of William IV., when by the new warrant then issued the president and six of the fellows of the Royal Astronomical Society were added to the list of visitors.

In 1780, under the presidency of Sir Joseph Banks, the Royal Society removed from Crane Court to the apartments assigned to them by the Government in the new Somerset House, where they remained until they removed to Burlington House in 1857. The policy of Sir Joseph Banks was to render the fellowship more difficult of attainment than it had been, and the measures which he took for this purpose, combined with other circumstances, led to the rise of a faction headed by Dr Horsley. Throughout the years 1783 and 1784 feeling ran exceedingly high, but in the end the president was supported by the majority of the society. An account of the controversy will be found in a tract entitled *An Authentic Narrative of the Dissensions and Debates in the Royal Society*. In connexion with this policy of Sir Joseph Banks may be mentioned a further step in the same direction taken in the year 1847, when the number of candidates recommended for election by the council was limited to fifteen, and the election was made annual. Concurrently, however, with this gradual narrowing of the Royal Society's boundaries was the successive establishment of other scientific bodies. The founding of the Linnean Society in 1788 under the auspices of several fellows of the Royal Society was the first instance of the establishment of a distinct scientific association under royal charter. The Geological Society followed in 1807, and the Royal Astronomical Society in 1820. The Chemical, the Royal Geographical, and the Entomological are the remaining chartered scientific societies existing in London at the present time. The Royal Society continues, however, to hold the foremost place among the scientific bodies of England, not only from the number of eminent men included in its fellowship, but also from its close official connexion with the Government.

The following will serve as some indication of the variety and importance of the scientific matters upon which they have been consulted by or have memorialized the Government during the last seventy years:—1816, standard measures of length; 1817, expedition in search of North-West Passage; 1822, use of coal-tar in vessels of war; best manner of measuring tonnage of ships; 1823, corrosion of copper sheathing by sea-water; Babbage's calculating-machine; lightning-conductors for vessels of war; 1825, supervision of gas-works; 1826, Parry's North Polar expedition; 1832, tidal observations; 1835, instruments and tables for testing the strength of spirits; 1839, Antarctic expedition; magnetic observatories in the colonies; 1845, Franklin's Arctic expedition; 1849-55, Government grant for scientific research; 1862, the great Melbourne telescope; 1865, pendulum observations in India; 1866, reorganization of the meteorological department; 1868, deep sea research; 1872, "Challenger" expedition; 1874, Arctic expedition; 1875, eclipse expedition; 1876, Vivisection Bill; 1877, transit of Venus expedition; 1879, prevention of accidents in mines; 1881, pendulum observations; 1882, transit of Venus; cruise of the "Triton" in Faroe Channel; 1883, borings in delta of Nile; 1884, Bureau des Poids et Mesures; prime meridian conference, &c. One of the most important duties which the Royal Society performs on behalf of the Government is the administration of the annual grant of £4000 for the promotion of scientific research. This grant originated in a proposal by Lord John

Russell in 1849 that at the close of the year the president and council should point out to the first lord of the treasury a limited number of persons to whom the grant of a reward or of a sum to defray the cost of experiments might be of essential service. This grant of £1000 afterwards became annual, and was continued until 1876. In that year an additional sum of £4000 for similar purposes was granted, and the two funds of £1000 and £4000 were administered concurrently until 1881, in which year the two were combined in a single annual grant of £4000 under new regulations. One of the most useful of the society's undertakings of late years is the great catalogue of scientific papers,—an index, in eight quarto volumes, under authors' names, of all the memoirs of importance in the chief English and foreign scientific serials from the year 1800 to the year 1873. The work was prepared under the direction and at the expense of the Royal Society, and was printed by H. M. Stationery Office.

A statement of the trust funds administered by the Royal Society will be found in their published *Proceedings* under date November 30th of each year, and the origin and history of these funds will be found in Weld's *History of the Royal Society*, and in the late William Spottiswoode's "Anniversary Address for 1874" (*Proc. Roy. Soc.*, xxiii. p. 49). The income of the society is derived from the annual contributions and composition fees of the fellows, from rents, and from interest on various investments. The balance-sheet and an account of the estates and property are published in the *Proceedings* at each anniversary. Four medals (a Copley, two Royal, and a Davy) are awarded by the society every year, and the Rumford medal in alternate years. The first of these originated in a bequest by Sir Godfrey Copley (1709), and is awarded "to the living author of such philosophical research, either published or communicated to the society, as may appear to the council to be deserving of that honour"; the author may be an Englishman or a foreigner. The Rumford medal originated in a gift from Count Rumford in 1796 of £1000 3 per cent. consols, for the most important discoveries in heat or light made during the preceding two years. The Royal medals were instituted by George IV., and are awarded annually for the two most important contributions to science published in the British dominions not more than ten years nor less than one year from the date of the award. The Davy medal was founded by the will of Dr John Davy, F.R.S., the brother of Sir Humphry Davy, and is given annually for the most important discovery in chemistry made in Europe or Anglo-America. An enumeration of the awards of each of the medals will be found at the end of the list of fellows which is published annually by the society.

Under the existing statutes of the Royal Society every candidate for election must be recommended by a certificate in writing signed by six or more fellows, of whom three at least must sign from personal knowledge. From the candidates so recommended the council annually select fifteen by ballot, and on the first Thursday in June the names so selected are submitted to the society in the form of a printed balloting-sheet with space left for erasure and substitution of names. Princes of the blood may, however, be proposed at any ordinary meeting and put to the vote on the same day, and any member of H. M. privy council may be balloted for on the third ordinary meeting from the day upon which his certificate is read. Foreign members, not exceeding fifty, may be selected by the council from among men of the greatest scientific eminence, and proposed to the society for election. Every member of the privileged class is liable to an admission fee of £10 and an annual payment of £4; other fellows pay £3 per annum. The composition for annual payments is £60.

The anniversary meeting for the election of the council and officers is held on St Andrew's Day. The council for the ensuing year, out of which are chosen the president, treasurer, principal secretaries, and foreign secretary, must consist of eleven members of the existing council and ten fellows who are not members of the existing council. These are nominated by the president and council previously to the anniversary meeting. The session of the society is from November to June; the ordinary meetings are held every Thursday during the session, at 4.30 p.m. The selection for publication from the papers read before the society is made by the "Committee of Papers," which consists of the members of the council for the time being aided by referees. The papers so selected are published either in the *Philosophical Transactions* (4to) or the *Proceedings of the Royal Society* (8vo), and one copy of each of these publications is presented gratis to every fellow of the society and to the chief scientific societies throughout the world.

The making and repealing of laws is vested in the council, and in every case the question must be put to the vote on two several days of their meeting.

The text of the charters of the Royal Society is given in the appendix to Weld's *History of the Royal Society*, and in the same work will be found lists of the presidents, treasurers, secretaries, and assistant-secretaries from the foundation to the year 1845. Appendix IV. to Thomson's *History of the Royal Society* (1812) gives a chronological list of all the fellows down to the year 1812 with dates of birth, election, admission, and death, and an alphabetical index to the same,

Other histories are Bishop Sprat's (1667), which consists largely of a defence of the society against the attacks of *a priori* philosophers, and Dr Birch's (1750), which treats mainly of the society's scientific work. (H. R. *)

ROYAN, a town of France, in the department of Charente Inférieure, is situated on the right bank of the Gironde, where it joins the ocean; a branch line of 5½ miles connects it with Saujon, on the Seudre Railway, which joins the Bordeaux-Nantes line at Pons. Royan, which in 1881 had a population of only 4573 (5445 as a commune), is one of the most frequented bathing resorts on the Atlantic seaboard, the visitors numbering about 80,000 annually. Royan owes this popularity to its charming neighbourhood, pleasantly watered by brooks and shaded by fine trees down to the steep rocky shore. The coast is divided into a number of small bays or "conches," forming so many distinct beaches: to the east of the town is the "Grande Conche"; to the south the "Conche de Foncillon," separated from the first-named by a quay which forms a fine terraced esplanade; beyond the fort of Royan, which protects the entrance of the river, follow in succession the conches "du Chay" and "de Grand Robinson," and the most fashionable of all, that of Pontailac. In the Avenue de Pontailac stand a large new casino, a theatre, and a hydropathic establishment. Royan also has a race-course and a museum of natural history.

Royan, whose inhabitants were Protestants, had to sustain in 1622 an eight days' siege by the troops of Louis XIII. As late as the end of last century it was but a "bourg" of about one thousand inhabitants, noticeable only for its priory, where Brantôme wrote a portion of his *Chroniques*. The prosperity of the place dates from the Restoration, when steamboat communication was established with Bordeaux. The question of making of Royan the seaport for Bordeaux has often been mooted, but as yet the harbour is still a merely tidal one and is dry at low water. The sardine, here known by the name of royan, is caught by the local fishermen.

ROYER-COLLARD, PIERRE PAUL (1763-1845), French statesman and philosopher, was born on the 21st June 1763 at Sompuis near Vitry-le-Français. At an early age he became a member of the bar, and pleaded several times in the old parlement of Paris. On the breaking out of the Revolution he took the popular side, and was elected to a seat in the municipal council of Paris. He was secretary to this body from 1790 to 1792, but separated himself from the later excesses of the Revolution. During the Reign of Terror he lived in retirement at Sompuis, and after vainly endeavouring in 1797, as member of the Council of Five Hundred, to bring about the restoration of the monarchy, he retired altogether from public life till the fall of Napoleon in 1814. During the interval he devoted himself mainly to philosophical studies. Animated by a profound distrust of the negative sensationalism and materialism which had characterized the French philosophy of the 18th century, he found a master whom he could follow in Thomas Reid. The study of Reid's *Inquiry*, which he picked up on a book-stall, first gave a definite form and direction to his thinking. Royer-Collard may be said to have introduced Reid to France, and the works of the Scottish philosopher were translated not long afterwards by his pupil Jouffroy. In 1810 Royer-Collard became professor of philosophy, and taught with success in Paris, till the Restoration recalled him to political life. In 1815 he was elected to represent his native department of the Marne in the chamber of deputies; he was also made councillor of state and appointed president of the commission of public instruction. A royalist of moderate views, he helped to restrain the extreme members of his own party, opposing alike the reactionary laws against the press and the proposal to give the clergy control of public instruction. In 1827 he was so popular as to be elected in seven departments, and shortly afterwards he became a member of the French Academy; in the following year he

was made president of the chamber. In this capacity he had the unpleasant duty of presenting to Charles X. the address in which the majority of the chamber refused their further support to the Government (March 1830). Royer-Collard retained his position as deputy under the new régime of Louis Philippe, but no longer took a prominent part in public affairs. In 1842 he withdrew completely from active life and spent most of his remaining time at his country seat of Châteaueux near Sainte-Aignan. He died there on the 2d September 1845.

As a philosopher, Royer-Collard is not distinguished either by originality or profundity; but he possesses a certain importance as having transplanted to France the philosophy of common sense. He has himself left no philosophical writings except some fragments which appear in Jouffroy's edition of Reid; but by his example and teaching he founded the school which has been variously named the Scoto-French, the eclectic, the spiritualistic, or the psychological. Maine de Biran, Cousin to some extent, and Jouffroy in a closer way, as well as Janet and others at the present day, are the chief representatives of the school. The name "Spiritualisme," which is perhaps the commonest designation, expresses the tenacity with which, in opposition to the dominant sensationalistic materialism of France, it upholds the doctrine of a spiritual Ego as a fact of consciousness. The title psychological, however, would be preferred by the philosophers themselves as describing their method, and the basis on which they claim to have erected their philosophy. Philosophy tends for them, as for Reid and Stewart, to become a classification of isolated facts of consciousness.

Several biographies of Royer-Collard have been published. Barante, *Vie politique de M. Royer-Collard, ses discours, et ses écrits*, 1881, is the fullest. Others are by Philippe and Lacombe. In addition may be mentioned *Mémoires sur Royer-Collard*, by his nephew Genty de Bussy.

ROYLE, JOHN FORBES (1800-1858), a distinguished botanist and teacher of materia medica. His reputation is especially founded upon the results of personal investigations in the Himalaya Mountains and in other parts of Hindustan. He was born in Cawnpore in 1800. His medical education was obtained in London, and on its completion he entered the service of the East India Company, and was sent to India in 1822 in the grade of assistant surgeon. In this service he devoted himself to studying in the field the botany and geology of the regions within his reach, and made large collections among the Himalaya Mountains. He also made special investigations of the medical properties of the plants of Hindustan and of the history of their uses among the native races. The results of these investigations appeared in 1837 in the form of a valuable work *On the Antiquity of Hindoo Medicine*. For nearly ten years he held the post of superintendent of the East India Company's botanic garden in the Himalayas at Saharanpur. He returned to London on furlough in 1831, and in 1837 he was appointed to the professorship of materia medica in King's College, London, a position which he held till 1856. From 1838 onwards he conducted a special department of correspondence, relating to vegetable products, at the East India House, and at the time of his death he had just completed there the formation and arrangement of an extensive and valuable museum of technical products from the East Indies. In 1851 he superintended the Indian department of the Great Exhibition. He died at Acton near London on 2d January 1858.

The work on which his reputation chiefly rests is the *Illustrations of the Botany and other branches of Natural History of the Himalaya Mountains, and of the Flora of Cashmere*, in 2 vols. 4to, begun in 1839. It contains much information on the natural products of India, especially on such as are useful in the arts or as drugs. In addition to this work, however, he wrote several others of repute, viz., *An Essay on the Productive Resources of India* (1840), *A Manual of Materia Medica* (1845), *An Essay on the Cultivation of Cotton* (1857), and on *The Cordage Plants and Vegetable Fibres of India* (1855). He also published a number of papers, between 1832 and 1855, upon subjects akin to those of his larger works, in scientific journals, for the most part published in India. Among these papers are included three on geological subjects. A list of the whole will be found in the *Royal Society's Catalogue of Scientific Papers*.

RUBBER. See INDIA-RUBBER.

RUBENS, PETER PAUL (1577–1640), the most eminent representative of Flemish art, and one of the greatest painters of any school, was born very probably at Siegen, in Westphalia, on the 29th of June 1577. Till some thirty years ago Cologne might still claim the honour of having been the master's birthplace; the Rhenish city is mentioned by Rubens himself, in one of his letters, as closely connected with his childhood, and through his father's epitaph we learn that for more than nineteen years Cologne was the family's place of refuge amid the disturbances prevailing in the Low Countries. This, however, has been proved to be but part of the truth, and, if Rubens's parents certainly during several years did live at Cologne, they also resided elsewhere, and that for reasons so strong that both wife and husband might well desire to see them for ever buried in secrecy.

Although of humble descent,—his father was a druggist,—John Rubens was a man of learning. He had studied law at home and abroad, and became councillor and alderman in his native town (1562). A Catholic by birth, it was not long before he became, like many of his countrymen, a zealous upholder of the Reformation, and we even find him spoken of by a contemporary as "*le plus docte Calviniste qui fust pour lors au Bas Pays.*" After the plundering of the Antwerp churches in 1566, the magistrates were called upon for a justification. While openly they declared themselves devoted sons of the church, a list of the followers of the Reformed creed, headed by the name of Anthony Van Stralen, the burgomaster, got into the hands of the duke of Alva. This was a sentence of death for the magistrates, and John Rubens lost no time in quitting Spanish soil, ultimately settling at Cologne (October 1568), with his wife and four children.

In his new residence he became legal adviser to Anne of Saxony, the second wife of the prince of Orange, William the Silent. Before long it was discovered that their relations were not purely of a business kind. Thrown into the dungeons of Dillenburg, Rubens lingered there for many months, his wife, Maria Pypelinx, never relaxing her endeavours to get the undutiful husband restored to freedom. Two years elapsed before the prisoner was released, and then only to be confined to the small town of Siegen. Here he lived with his family, from 1573 to 1578, and here most probably Maria Pypelinx gave birth to Philip, afterwards town-clerk of Antwerp, and Peter Paul. A year after (May 1578) the Antwerp lawyer got leave to return to Cologne, where he died on the 18th of March 1587, after having, it is said, returned to Catholicism. As there are at Siegen no records going back to the 16th century, the facts relating to the birth of Peter Paul Rubens must, of course, remain conjectural, but his mother certainly was at Siegen a few days before his birth, for we find her there, petitioning in favour of John Rubens, on June 14, 1577.

Rubens went to Antwerp with his mother when he was scarcely ten years of age, and made good progress in his classical studies, which he had begun with the Jesuits at Cologne. An excellent Latin scholar, he was also proficient in French, Italian, English, German, and Dutch. Part of his boyhood he spent as a page in the household of the countess of Lalaing, in Brussels; but, tradition adds, and we may well believe, the youth's disposition was such as to induce his mother to allow him to follow his proper vocation, choosing as his master Tobias Verhaecht, who was in some way connected with the family. Not the slightest trace of this first master's influence can be detected in Rubens's works. Not so with Adam Van Noort, to whom the young man was next apprenticed. Van Noort,

whose aspect of energy is well known through Van Dyck's beautiful etching, was the highly esteemed master of numerous painters,—among them Van Balen, Sebastian Vrancx, and Jordaens, later his son-in-law. His pictures are almost exclusively to be found in Antwerp churches.

Rubens remained with Van Noort for the usual period of four years, thereafter studying under Otto Vœnius or Van Veen, a gentleman by birth, a most distinguished Latin scholar, and a painter of very high repute. He was a native of Leyden, and only recently settled in Antwerp, but the town gave him numerous commissions of importance. Though Rubens never adopted his style of painting, the tastes of master and pupil had much in common, and some pictures by Otto Vœnius can be pointed out as having inspired Rubens at a more advanced period. For example, the Magdalene anointing Christ's Feet, painted for the cathedral at Malaga, and now at the Hermitage in St Petersburg, closely resembles in composition the very important work of Otto Vœnius in the church at Bergues near Dunkirk.

In 1598, Adam Van Noort acting as dean of the Antwerp guild of painters, Rubens was officially recognized as "master,"—that is, was allowed to work independently and receive pupils. We have no means of forming an idea of his style at this early period, two years before his journey to Italy, but even the somewhat later works found at Genoa, Mantua, and Rome differ considerably from what may be termed the Rubenesque.

From 1600 to the latter part of 1608 Rubens belonged to the household of Vincenzo Gonzaga, duke of Mantua. Few princes in Italy surpassed the Gonzagas in splendour. For them Mantegna, Giulio Romano, Titian, and Primaticcio had produced some of their most admired works, and their now deserted palaces still bear traces of the richest decoration. To the Mantuan collection the Pitti palace, the Louvre, and the royal galleries of England owe some of their noblest specimens of Italian art. How Rubens came to be engaged at Mantua has not been explained. The duke, it is known, spent some time at Venice in July 1600, and is supposed there to have met his future painter, but it is also to be remembered that another Fleming, Francis Pourbus the younger, was at the time employed by him in taking the likeness of the prettiest women of the day; and Rubens, much against his will, was also, at first, it seems, intrusted with a similar task. The influence of the master's stay at Mantua was of extreme importance, and cannot be too constantly kept in view in the study of his later works.

Sent to Rome in 1601, to take copies from Raphael for his master, he was also commissioned to paint several pictures for the church of Santa Croce, by the archduke Albert of Austria, sovereign of the Spanish Netherlands, and once, when he was a cardinal, the titular of that see. A copy of Mercury and Psyche after Raphael is preserved in the museum at Pesth. The religious paintings—the Invention of the Cross, the Crowning with Thorns, and the Crucifixion—are to be found in the hospital at Grasse in Provence.

At the beginning of 1603 "The Fleming," as he was termed at Mantua, was sent to Spain with a variety of presents for Philip III. and his minister the duke of Lerma, and thus had opportunity to spend a whole year at Madrid and become acquainted with some of Titian's masterpieces. Two of his own works, known to belong to the same period, are in the Madrid Gallery, Heraclitus and Democritus. Of Rubens's abilities so far back as 1604 we get a more complete idea from an immense picture now in the Antwerp Gallery, the Baptism of Our Lord, originally painted for the Jesuits at Mantua. Here it may be seen to what degree Italian surroundings had

influenced the painter of Vincenzo Gonzaga. Vigorous to the extreme in design, he reminds us of Michelangelo as much as any of the degenerate masters of the Roman school, while in decorative skill he seems to be descended from Titian and in colouring from Giulio Romano. Equally with this picture the Transfiguration, now in the museum at Nancy, and the portraits of Vincenzo and his consort, kneeling before the Trinity, in the library at Mantua, claim a large share of attention, apart from the interest awakened by the name of their author.

Two years later we meet a very large altarpiece of the Circumcision at St Ambrogio at Genoa, the Virgin in a glory of Angels, and two groups of Saints, painted on the wall, at both sides of the high altar in the church of Santa Maria in Valicella, in Rome. Undoubtedly these works give an impression of grandeur and effectiveness, but, in the immediate vicinity of the finest productions of the Italian school, they rank higher as documentary evidence than in intrinsic value, and remind us of a saying of Baglione, who was acquainted with Rubens in Italy, "Apprese egli buon gusto, e diede in una maniera buona Italiana."

While employed at Rome in 1608, Rubens received most alarming news as to the state of his mother's health. The duke of Gonzaga was then absent from Italy, but the dutiful son, without awaiting his return, at once set out for the Netherlands, though with the full intention of shortly resuming his post at court, as we gather from a letter to Annibale Chieppio, the Mantuan minister. When he arrived in Antwerp, Maria Pypelincx was no more. However strong his wish might now be to return to Italy, his purpose was overruled by the express desire of his sovereigns, Albert and Isabella, to see him take up a permanent residence in the Belgian provinces. Scarcely a year before, the archduke had unsuccessfully attempted to free the painter from his engagement at Mantua, and he could not fail to take advantage of the opportunity now presented for the fulfilment of his wishes. On August 3, 1609, Rubens was named painter in ordinary to their Highnesses, with a salary of 500 livres, and "the rights, honours, privileges, exemptions," &c., belonging to persons of the royal household, not to speak of the gift of a gold chain. Not least in importance for the painter was his complete exemption from all the regulations of the guild of St Luke, entitling him to engage any scholars or fellow-workers, without being obliged to have them enrolled,—a favour, it must be added, which has been the source of considerable trouble to the historians of Flemish art.

Although so recently returned to his native land, Rubens seems to have been, with one accord, accepted by his countrymen as the head of their school, and the municipality was foremost in giving him the means of proving his acquirements. The first in date among the numerous repetitions of the Adoration of the Magi is a picture in the Madrid Gallery, measuring 12 feet by 17, and containing no fewer than eight-and-twenty life size figures, many in gorgeous attire, warriors in steel armour, horsemen, slaves, camels, &c. This picture, painted in Antwerp, at the town's expense in 1609, had scarcely remained three years in the town-hall when it went to Spain as a present to Don Rodrigo Calderon, count of Oliva. The painter has represented himself among the horsemen, bareheaded, and wearing his gold chain. Cumberland speaks of this picture as the standard work of its author, and certainly it was well calculated to bring Rubens to the front rank in his profession. From a letter written in May 1611 we know that more than a hundred young men were desirous to become his pupils, and that many had, "for several years," been waiting with other masters, until he could admit them to his studio. It was thus from the

beginning regarded as a great favour to be admitted a pupil of Rubens.

Apart from the success of his works, another powerful motive had helped to detain the master in Antwerp,—his marriage with Isabella Brant (October 1609). Many pictures have made us familiar with the graceful young woman who was for seventeen years to share the master's destinies. We meet her at The Hague, St Petersburg, Florence, at Grosvenor House, but more especially at Munich, where Rubens and his wife are depicted at full length on the same canvass. "His wife is very handsome," observes Sir Joshua Reynolds, "and has an agreeable countenance;" but the picture, he adds, "is rather hard in manner." This, it must be noted, is the case with all those pictures known to have immediately followed Rubens's return, when he was still dependent on the assistance of painters trained by others than himself. Even in the Raising of the Cross, now in the Antwerp cathedral, and painted for the church of St Walburg in 1610, the dryness in outline is very striking.

According to the taste still at that time prevailing, the picture is tripartite, but the wings only serve to develop the central composition, and add to the general effect. In Witdoeck's beautiful engraving the partitions even disappear. Thus, from the first, we see Rubens quite determined upon having his own way, and it is recorded that, when he painted the Descent from the Cross, St Christopher, the subject chosen by the Arquebusiers, was altered so as to bring the artistic expressions into better accordance with his views. Although the subject was frequently repeated by the great painter, this first Descent from the Cross has not ceased to be looked upon as his masterpiece. Begun in 1611, the celebrated work was placed in 1614, and certainly no more striking evidence could be given of the rapid growth of the author's abilities. Rubens received 2400 florins for this picture.

Although it is chance that has brought the Raising of the Cross and the Descent from the Cross into their present close juxtaposition, it is not improbable that their uniformity in size may have been designed. In many respects, Italian influence remains conspicuous in the Descent. Rubens had seen Ricciarelli's fresco at the Trinita de' Monti, and was also acquainted with the grandiose picture of Baroccio in the cathedral of Perugia, and no one conversant with these works can mistake their influence. But in Rubens strength of personality could not be overpowered by reminiscence; and in type, as well as in colouring, the Descent from the Cross may be termed thoroughly Flemish and Rubenesque. As Waagen justly observes: "the boldness of the composition, the energy in the characters, the striking attitudes, and the effects of the grouping, together with the glowing vigorous colouring, belong to his later style, whereas a few of the heads, particularly that of the Virgin, display the careful execution of his earlier period. The interior of the wings, on which are painted the Visitation and the Presentation in the Temple, exhibit, on the other hand, a greater resemblance to the conjugal picture already alluded to, owing to a certain repose in action, a more elevated expression of delicacy and feeling in the characters, and a less glowing though still admirable colouring."

Legend, in some way, connects Van Dyck with the Descent from the Cross, and ascribes to the great portrait painter an arm and shoulder of Mary Magdalene, which had been damaged by a pupil's carelessness. Plain truth here, once more, seems to contradict romance. Van Dyck was a pupil of Van Balen's in 1609, and most probably remained with him several years before coming to Rubens.

If Sir Dudley Carleton could speak of Antwerp in 1616 as "Magna civitas, magna solitudo," there was no place

nevertheless which could give a wider scope to artistic enterprise. Spain and the United Provinces were for a time at peace; almost all the churches had been stripped of their adornments; monastic orders were powerful and richly endowed, guilds and corporations eager to show the fervour of their Catholic faith, now that the "monster of heresy" seemed for ever quelled. Here were opportunities without number for painters as well as sculptors and architects. Gothic churches began to be decorated according to the new fashion adopted in Italy. Altars magnified to monuments, sometimes reaching the full height of the vaulted roof, displayed, between their twisted columns, pictures of a size hitherto unknown. No master seemed better fitted to be associated with this kind of painting than Rubens, whose works we have already met with in churches newly erected at Rome, Genoa, and Mantua, by the Jesuits, in the gorgeous style which bears their name, and which Rubens commends in the preface to his *Palazzi di Genova* (Antwerp, 1622). The temple erected by the reverend fathers in Antwerp was almost entirely the painter's work, and if he did not, as we often find asserted, design the front, he certainly was the inspirer of the whole building, which, after all, was but a reminiscence of the churches in Genoa. And the temple of the Jesuits in Antwerp remained for a century the only example of its kind in Belgium. Hitherto no Fleming had undertaken to paint ceilings with foreshortened figures, and blend the religious with the decorative art after the style of those buildings which are met with in Italy, and owe their decorations to masters like Titian, Veronese, and Tintoretto. No less than forty ceilings were composed by Rubens, and painted under his direction in the space of two years. All were destroyed by fire in 1718. Sketches in water-colour were taken some time before the disaster by De Wit, and from these were made the etchings by Punt which alone enable us to form a judgment of the grandiose undertaking. In the Madrid Gallery we find a general view of the church in all its splendour. The present church of St Charles in Antwerp is, externally, with some alteration, the building here alluded to.

Rubens delighted in undertakings of the vastest kind. "The large size of a picture," he writes to W. Trumbull in 1621, "gives us painters more courage to represent our ideas with the utmost freedom and semblance of reality. . . . I confess myself to be, by a natural instinct, better fitted to execute works of the largest size." The correctness of this appreciation he was very soon called upon to demonstrate most strikingly by a series of twenty-four pictures, illustrating the life of Mary de' Medici, queen-mother of France. The gallery at the Luxembourg Palace, which these paintings once adorned, has long since disappeared, and the complete work is now exhibited in the Louvre. Drawings, it seems, had been asked from Quentin Varin, the French master who incited Poussin to become a painter, but Rubens was ultimately preferred. This preference may in some degree be ascribed to his former connexion with the court at Mantua, Mary de' Medici and the duchess of Gonzaga being sisters. The story of Mary de' Medici may be regarded as a poem in painting, and no person conversant with the literature of the time can fail to recognize that strange mixture of the sacred and the mythological in which the most admired authors of the 17th century, beginning with Malherbe, delight. Absolutely speaking, Mrs Jameson may be right in criticizing Rubens's "coarse allegories, historical improprieties, &c."; but a man belongs to his time, and uses its language in order to make himself understood. From the cradle to the day of her reconciliation with Louis XIII., we follow Mary de' Medici after the manner in which it was customary in those days to consider personages of

superior rank. The Fates for her have spun the silken and golden thread; Juno watches over her birth and intrusts her to the town of Florence; Minerva, the Graces, and Apollo take charge of her education; Love exhibits her image to the king, and Neptune conveys her across the seas; Justice, Health, and Plenty endow her son; Prudence and Generosity are at her sides during the regency; and, when she resigns the helm of the state to the prince, Justice, Strength, Religion, and Fidelity hold the oars. The sketches of all these paintings—now in the Munich Gallery—were painted in Antwerp, a numerous staff of distinguished collaborators being intrusted with the final execution. But the master himself spent much time in Paris, retouching the whole work, which was completed within less than four years. On May 13, 1625, Rubens writes from Paris to his friend Peiresc that both the queen and her son are highly satisfied with his paintings, and that Louis XIII. came on purpose to the Luxembourg, "where he never has set foot since the palace was begun sixteen or eighteen years ago." We also gather from this letter that the picture representing the Felicity of the Regency was painted to replace another, the Departure of the Queen, which had caused some offence. "If I had been let alone," he says, "the other subjects would have been better accepted by the court, and without scandal or murmur." "And I fear," he adds, "far greater difficulties will be found with the subjects of the next gallery." Richelieu gave himself some trouble to get this part of the work, intended to represent the life of Henry IV., bestowed upon Cavalier d'Arpina, but did not succeed in his endeavours. The queen's exile, however, prevented the undertaking from going beyond a few sketches, and two or three panels, one of which, the Triumph of Henry IV., now in the Palazzo Pitti, is one of the noblest works of Rubens or of any master. Most undoubtedly the painter here calls to his aid his vivid recollections of the Triumph of Cæsar by Mantegna, now at Hampton Court, but in his day adorning the palace at Mantua; of this he made a copy, inscribed No. 315 in the catalogue of his effects sold in 1640, and now in the National Gallery.

On the 11th of May 1625 Rubens was present at the nuptials of Henrietta Maria at Notre Dame in Paris, when the scaffolding on which he stood gave way, and he tells us he was just able to catch an adjoining tribune.

No painter in Europe could now pretend to equal Rubens either in talent or in renown. Month after month productions of amazing size left the Antwerp studio; and to those unacquainted with the master's pictures magnificent engravings by Vorsterman, Pontius, and others had conveyed singularly striking interpretations. "Whatever work of his I may require," writes Moretus, the celebrated Antwerp printer, "I have to ask him six months before, so as that he may think of it at leisure, and do the work on Sundays or holidays; no week days of his could I pretend to get under a hundred florins."

Of the numerous creations of his pencil, none, perhaps, will more thoroughly disclose to us his comprehension of religious decorative art than the Assumption of the Virgin at the high altar of the Antwerp cathedral, finished in 1625. It is, of twenty repetitions of this subject, the only example still preserved at the place it was intended by the painter to occupy. In spirit we are here reminded of Titian's Assunta in the cathedral at Verona, but Rubens's proves perhaps a higher conception of the subject. The work is seen a considerable way off, and every outline is bathed in light, so that the Virgin is elevated to dazzling glory with a power of ascension, scarcely, if ever, attained by any master.

Able to rely so greatly on his power as a colourist, Rubens is not a mere decorator. He penetrates into the

spirit of his subjects more deeply than, at first sight, seems consistent with his prodigious facility in execution. The Massacre of the Innocents, in the Munich Gallery, is a composition that can leave no person unmoved,—mothers defending their children with nails and teeth. If Mrs Jameson terms this picture atrocious, it ought to be recollected how atrocious is the subject. When St Francis attempts to shelter the universe from the Saviour's wrath (Brussels Gallery), Rubens, drawing his inspiration from a passage of St Germain, "*Ostendit mater filio pectus et ubera*," recalls to our memory that most dramatic passage of the *Iliad* when Hecuba, from the walls of Troy, entreats her son Hector to spare his life. The subject is inconsistent with the spirit of Christianity, says Waagen, evidently forgetting that to Catholic eyes nothing could be more impressive than the Virgin's intervention at this supreme moment, when Christ, like another Jupiter, brandishes his thunderbolt against mankind. Rubens was a man of his time; his studies of Italian art in no way led him back to the Quattrocentisti nor the Raffaelschi; their power was at an end. The influence of Michelangelo, Titian, Tintoretto, more especially Baroccio, Polydoro, and even Parmigiano, is no less visible with him than with those masters who, like Spranger, Chr. Schwartz, and Goltzius, stood high in public estimation immediately before his advent.

In the midst of the rarest activity as a painter, Rubens was now called upon to give proofs of a very different kind of ability. The truce concluded between Spain and the Netherlands in 1609 ended in 1621; archduke Albert died the same year. His widow sincerely wished to prolong the arrangement, still hoping to see the United Provinces return to the Spanish dominion, and in her eyes Rubens was the fittest person to bring about this conclusion. The painter's comings and goings, however, did not remain unheeded, for the French ambassador writes from Brussels in 1624,—"*Rubens is here to take the likeness of the prince of Poland, by order of the infanta. I am persuaded he will succeed better in this than in his negotiations for the truce.*" But, if Rubens was to fail in his efforts to bring about an arrangement with the Netherlands, other events enabled him to render great service to the state.

Rubens and Buckingham met in Paris in 1625; a correspondence of some importance had been going on between the painter and the Brussels court, and before long it was proposed that he should endeavour to bring about a final arrangement between the crowns of England and Spain. The infanta willingly consented, and King Philip, who much objected to the interference of an artist, gave way on hearing, through his aunt, that the negotiator on the English side, B. Gerbier—a Fleming by birth—was likewise a painter. Rubens and Gerbier very soon met in Holland. "*Rubens is come hither to Holland, where he now is, and Gerbier in his company, walking from town to town, upon their pretence of pictures,*" writes Sir Dudley Carleton to Lord Conway in July 1627, "*which may serve him for a few days if he dispatch and be gone; but yf he entertayne tyme here long, he will infallibly be layd hold of, or sent with disgrace out of the country This I have made known to Rubens least he should meet with a skorne what may in some sort reflect upon others.*" Matters, however, went on very well, and Rubens volunteered to go to Spain and lay before the council the result of his negotiations (1628). Nine months were thus spent at Madrid; they rank among the most important in Rubens's career. He had brought with him eight pictures of various sizes and subjects as presents from the infanta, and he was also commissioned to take several portraits of the king and royal family. An

equestrian picture of Philip IV., destroyed by fire in last century, became the subject of a poem by Lope de Vega, and the description enables us to identify the composition with that of a painting now in the Palazzo Pitti, ascribed to Velazquez.

Through a letter to Peiresc we hear of the familiar intercourse kept up between the painter and the king. Philip delighted to see Rubens at work in the studio prepared for him in the palace, where he not only left many original pictures, but copied for his own pleasure and profit the best of Titian's. No less than forty works were thus produced, and, says the author of the *Annals of the Artists of Spain*, "*the unwearied activity of his well-stored mind is exemplified by the fact that amid his many occupations he was seeking in the libraries materials for an edition of Marcus Aurelius, on which his friend Gaspard Gevaerts was then engaged.*" An artistic event of some importance connected with the sojourn in Spain is the meeting of Rubens and Velazquez, to the delight, and we venture to add, advantage of both.

Great as was the king's admiration of Rubens as a painter, it seems to have been scarcely above the value attached to his political services. Far from looking upon Rubens as a man of inferior calling, unworthy to meddle with matters of state, he now commissioned the painter to go to London as bearer of his views to Charles I. Giving up his long cherished hope of revisiting Italy on his return from Spain, Rubens, honoured with the title of secretary of the king's privy council in the Netherlands, started at once on his new mission. Although he stopped but four days in Antwerp, he arrived in London just as peace had been concluded with France. In this conjuncture of affairs, it can hardly be doubted that the eminent position of Rubens as a painter greatly contributed to his ultimate success as an envoy. Received by Charles with genuine pleasure, he very soon was able to ingratiate himself so far as to induce the king to pledge his royal word to take part in no undertakings against Spain so long as the negotiations remained unconcluded, and all the subsequent endeavours of France, Venice, and the States found him immovable in this resolution. Although the privy council in Madrid, as well they might, passed several votes of thanks to Rubens, the tardiness of the Spanish court in sending a regular ambassador involved the unfortunate painter in distressing anxieties, and the tone of his dispatches is very bitter. But he speaks with the greatest admiration of England and the English, regretting that he should only have come to know the country so late. His popularity must have been very great, for on September 23, 1629, the university of Cambridge conferred upon him the honorary degree of master of arts, and on February 21, 1630, he was knighted, the king presenting him with the sword used at the ceremony, which is still preserved by the descendants of the artist.

When the council at Madrid had to deliberate as to recognition of the title conferred upon Rubens in England, they remembered that Titian had been made a knight by the emperor Charles V., and the matter was settled without difficulty; but, the painter's name having been mentioned as a possible envoy to the British court, Olivares objected that it was quite out of the question to make an ambassador of one who lived by the work of his hands.

Although, it seems, less actively employed as an artist in England than in Spain, Rubens, besides his sketches for the decoration of the Banqueting House at Whitehall, painted the admirable picture of the Blessings of Peace, now in the National Gallery. There is no reason to doubt, with Smith, that "*His Majesty sat to him for his portrait, yet it is not a little remarkable that no notice occurs in any of the royal catalogues, or the writers of the*

period, of the existence of such a portrait." While in England, Rubens very narrowly escaped drowning while going to Greenwich in a boat. The fact is reported by Lord Dorchester in a letter to Sir Isaac Wake (Sainsbury, cxvi.). At the beginning of March the painter's mission came to a close.

Rubens was now fifty-three years of age; he had been four years a widower, and before the end of the year (December 1630) he entered into a second marriage with the beautiful girl of sixteen, named Helena Fourment, with whom his pictures have made the world so well acquainted. More than twenty portraits of her are described by Smith, and she also figures in perhaps twice as many of the master's creations. Whether Rubens was more powerfully led in the choice of his second wife by her personal beauty or by the strength of a certain resemblance to his feminine ideal is questionable. Anyhow, she was an admirable model, and none of her husband's works may be more justly termed masterpieces than those in which she is represented (Munich, St Petersburg, Blenheim, Liechtenstein, the Louvre, &c.).

Although the long months of absence could not be termed blanks in Rubens's artistic career, his return was followed by an almost incredible activity. Inspired more than ever by the glorious works of Titian, he now produced some of his best creations. Brightness in colouring, breadth of touch and pictorial conception, are specially striking in those works we know to have been painted in the latter part of his lifetime. Could anything give a higher degree of Rubens's genius than, for example, the Feast of Venus, the portrait of Helena Fourment ready to enter the bath, or the St Ildefonso. This last picture—now, as well as the two others just alluded to, in the Vienna Gallery—was painted for the church of the convent of St Jacques, in Brussels. On the wings are represented the archdukes in royal attire, under the protection of their patron saints. The presence of these figures has led to some mistake regarding the date of the production, but it has been proved beyond doubt, through a document published by Mr Castan (1884), that the St Ildefonso belongs to the series of works executed after the journeys to Spain and England. Archduke Albert had been dead ten years. The picture was engraved by Witdoeck in 1638.

Isabella died in 1633, and we know that to the end Rubens remained in high favour with her, alike as an artist and as a political agent. The painter was even one of the gentlemen she deputed to meet Mary de' Medici at the frontier in 1631, after her escape from France.

Spain and the Netherlands went to war again, the king never ceasing to look upon the Dutch as rebels. The subject need not be dwelt upon; suffice it to say that much useless trouble and suspicion came upon the great artist. As to the real nature of his communings with Frederick Henry of Orange, whom he is known to have interviewed, nothing as yet has been discovered.

Ferdinand of Austria, the cardinal-infant of Spain, was called to the government of the Netherlands on the death of his aunt. He was the king's younger brother, and arrived at Antwerp in May 1635. The streets had been decorated with triumphal arches and "spectacula," arranged by Rubens, and certainly never equalled by any other works of the kind.¹ Several of the paintings detached from the arches were offered as presents to the new governor-general, a scarcely known fact, which accounts for the presence of many of these works in public galleries

¹ Many sketches of the arches are still preserved in the museums in Antwerp, St Petersburg, Cambridge, Windsor, &c. All the compositions were etched under the direction of Rubens by his pupil J. Van Thulden and published under the title of *Pompa introitus honoris serenissimi Principis Ferdinandi Austriaci S. R. E. card. a S. P. Q. Antwerp. decreta et ordinata*.

(Vienna, Dresden, Brussels, &c.). Rubens was at the time laid up with gout, but Prince Ferdinand was desirous of expressing his satisfaction, and called upon the painter, remaining a long time at his house. Rubens and Ferdinand had met at Madrid, and only a short time elapsed before the painter was confirmed in his official standing,—a matter of small importance, if we consider that the last years of his life were almost exclusively employed in working much more for the king than for his brother. About a hundred and twenty paintings of considerable size left Antwerp for Madrid in 1637, 1638, and 1639; they were intended to decorate the pavilion erected at the Pardo, and known under the name of Torre de la Parada. Another series had been begun, when Ferdinand wrote to Madrid that the painter was no more, and Jordaens would finish the work. Rubens breathed his last on the 30th of May 1640.

More fortunate than many artists, Rubens left the world in the midst of his glory. Not the remotest trace of approaching old age, not the slightest failing of mind or skill, can be detected even in his latest works, such as the Martyrdom of St Peter at Cologne, the Martyrdom of St Thomas at Prague, or the Judgment of Paris at Madrid, where his young wife appears for the last time. "She is the handsomest person in Antwerp," writes Ferdinand to his brother, in announcing the completion of what he terms "the best painting Rubens has done."

If Rubens was something of a diplomatist, it cannot be denied that alike in body as in mind he is portrayed in his own works with the utmost straightforwardness. His productions are what they are, as if they could not have been otherwise, and the fact is that, in reply to any observations he may happen to receive, we constantly find him asserting the necessities of his subjects, thus confirming a remark made by Sir Joshua Reynolds that his subjects always seem to suit his style.

Rubens is so well known that it hardly seems necessary to dwell upon his outward appearance. From his own letters and those in which he is referred to we become acquainted with a man of vast erudition, great good sense, dignity, and kindness, none more worthy of being called a gentleman; and Sir Dudley Carleton, we know, termed him not only the prince of painters but of gentlemen.

Those with whom he dealt in questions of learning proclaim his artistic excellence to be second only to his other qualifications, and even such critics as Winckelmann, who are least likely to sympathize with his style, do homage to his superior genius. "Rubens," he writes to Count Cobenzl, "is the glory of art, of his school, of his country, and of all coming centuries; the fertility of his imagination cannot be overrated; he is correct in his design, magnificent in his drapery; and he must be looked upon as the great model for chiaroscuro, although in this branch he may be termed fanciful, but he has not sacrificed to the goddesses of beauty (*Eros*) and the Graces."

Rubens, indeed, although his type of feminine beauty is generally most pleasing, has little of the Italian grace and refinement, but then he was a Fleming throughout, notwithstanding his frequent recollections of those Italian masters whom he most admired, and who themselves have little, if anything, in common with Raphael. But it must be borne in mind how completely his predecessors were frozen into stiffness through Italianization, and how necessary it was to bring back the Flemish school to life and nature. Critics have spoken of Rubens's historical improprieties. Of course nobody could suppose that his classical learning did not go far enough to know that the heroines of the Old Testament or of Roman history were not dressed out as ladies of his time; but in this respect he only follows the example of Titian, Paul Veronese, and many others. In no other school do we find these animated hunts of lions, tigers, and even the hippopotamus and the crocodile, which may be reckoned among the finest specimens of art, and here again are life and nature displayed with the utmost power. "His horses are perfect in their kind," says Reynolds; his dogs are of the strong Flemish breed, and his landscapes the most charming pictures of Brabantine scenery, in the midst of which lay his seat of Steen. As a portrait painter, although less refined than Van Dyck, he shows that eminent master the way, and his pure fancy subjects, as the Garden of Love (Madrid and Dresden) and the Village Feast (Louvre), have never been equalled. As Mrs Jameson so justly remarks, "Rubens is the most popular because the most intelligible of painters."

For nearly one hundred years the Flemish school may be said to have been but a reflexion of the Rubenesque principles. Although Jordaens and Erasmus Quellin lived till 1678, the school might be termed a body without soul.

Some etchings have been ascribed to Rubens, but except a head

of Seneca, the only copy of which is in the Print Room at the British Museum, and a beautiful figure of St Catherine, we can admit none of the other plates, said to proceed from Rubens, as authentic. Rubens nevertheless exercised an immense influence on the art of engraving. Under his direct guidance Soutman, Vorsterman, Pontius, Witdoeck, the two Bolswards, Peter de Jode, N. Lauwers, and many others of less note left an immense number of beautiful plates, reproducing the most celebrated of his paintings. To give an idea of what his influence was capable of accomplishing, pictorially speaking, it might be sufficient to notice the transformation undergone by the Antwerp school of engraving under Rubens; even the modern school of engraving, in more than one respect, is a continuation of the style first practised in Antwerp. His influence is scarcely less apparent in sculpture, and the celebrated Luke Fayd'herbe was his pupil.

Neither in name nor in fact did the Flemish school ever find a second Rubens. None of his four sons became a painter, nor did any of his three daughters marry an artist. According to Rubens's will, his drawings were to belong to that one of his sons who might become a painter, or in the event of one of his daughters marrying a celebrated artist they were to be her portion. The valuable collection was dispersed only in 1659, and of the pictures sold in 1640 thirty-two became the property of the king of Spain. The Madrid Gallery alone possesses a hundred of his works. Four years after her husband's death Helena Fourment married J. B. Van Brouckhoven de Berghyeck, knight of St James, member of the privy council, &c. She died in 1673. In 1746 the male line of Rubens's descendants was completely extinct. In the female line more than a hundred families of name in Europe trace their descent from him.

The paintings of Rubens are found in all the principal galleries in Europe: Antwerp and Brussels, Madrid, Paris, Lille, Dresden, Berlin, Munich, Vienna, St Petersburg, London, Florence, Milan, Turin exhibit several hundreds of his works. J. Smith's *Catalogue* gives descriptions of more than thirteen hundred compositions.

RUBIDIUM. See POTASSIUM METALS.

RUBRUQUIS, the name which has most commonly been given to William of Rubruk, a Franciscan friar and the author of a remarkable narrative of Asiatic travel in the 13th century. Nothing is known of him save what can be gathered from his own narrative, with the exception of a word from the pen of Roger Bacon, his contemporary and brother Franciscan, indicating personal acquaintance. The name of Rubruquis has adhered to him, owing to this form ("Willielmus de Rubruquis") being found in the imperfect copy of the Latin original printed by Hakluyt in his collection, and followed in his English translation, as well as in the completer issue of the English by Purchas. Writers, again, of the 16th and 17th centuries have called the traveller Risbroucke and Rysbrokius, for which there is no authority,—an error founded on the too hasty identification of his name of origin with Ruysbroeck in Brabant (a few miles south of Brussels). This error was probably promoted by the fame of John of Ruysbroeck or Rysbroeck (1294-1381), a Belgian mystic theologian, whose treatises have been reprinted as late as 1848 (see vol. xvii. p. 133). Our traveller is styled "Guillaume de Rysbroeck" and "Ruysbroeck" in the *Biographie Universelle* and in the *Novv. Biog. Générale*. It is only within the last twenty years that attention has been called to the fact that Rubrouck is the name of a village and commune in what was formerly called French Flanders, belonging to the canton of Cassel in the department du Nord, and lying some 8½ miles north-east of St Omer. In the library of the latter city many mediæval documents exist referring expressly to

Rubrouck, and to persons in the 12th and 13th centuries styled as "de Rubrouck."¹ It may be fairly assumed that Friar William came from this place; indeed, if attention had been paid to the title of the MS. belonging to Lord Lumley, which was published by Hakluyt (*Itinerarium fratris Willielmi de Rubruquis de Ordine fratrum Minorum*, Galli, Anno Gratix 1253, ad partes Orientales), there need have been no question as to the traveller's quasi-French nationality;² but this (erroneously) has always been treated as if it were an arbitrary gloss of Hakluyt's own.

Friar William went to Tartary under orders from Louis IX. (St Louis). That king, at an earlier date, viz., December 1248, when in Cyprus, had been visited by certain persons representing themselves to be envoys from a great Tartar chief Ilchigaday (Ilchikadai), who commanded the Mongol hosts in Armenia and Persia. The king then despatched a return mission consisting of Friar Andrew of Lonjumeil and other ecclesiastics, who carried presents and letters for both Ilchikadai and the Great Khan. They reached the court of the latter in the winter of 1249-50, when there was in fact no actual khan on the throne; but in any case they returned, along with Tartar envoys, bearing a letter to Louis, which was couched in terms so arrogant and offensive that the king repented sorely of having sent such a mission (*li rois se repentit fort quant il y envoya*, Joinville, § 492). These returned envoys reached the king when he was at Cæsarea, therefore between March 1251 and May 1252. It was, however, not very long after that the zealous king, hearing that a great Tartar prince called Sartak was a baptized Christian, felt strongly moved to open communication with him, and for this purpose deputed Friar William of Rubruk with companions. But it is evident that the former rebuff had made the king chary as to giving these emissaries the character of his royal envoys, and Friar William on every occasion, beginning with a sermon delivered in St Sophia's (on Palm Sunday, i.e., April 13, 1253), formally disclaimed that character, alleging that, though he was the bearer of the king's letters and presents, he went simply in fulfilment of his duty as a Franciscan and preacher of the gospel.

Various histories of St Louis, and other documents which have come down to us, give particulars of the despatch of the mission of Friar Andrew from Cyprus, but none mention that of Friar William; and the first dates given by the latter are those of his sermon at Constantinople, and of his embarkation from Sinope (May 7, 1253). He must therefore have received his commission at Acre, where the king was residing from May 1252 to June 29, 1253; but he had travelled by way of Constantinople, as has just been indicated, and there received letters to some of the Tartar chiefs from the emperor, who was at this time Baldwin de Courtenay, the last of the Latin dynasty.

The narrative of the journey is everywhere full of life and interest, but we cannot follow its details. The vast conquests of Jenghiz Khan were still in nominal dependence on his successors, at this time represented by Mangu Khan, reigning on the Mongolian steppes, but practically those conquests were splitting up into several great monarchies. Of these the Ulûs of Jûji, the eldest son of Jenghiz, formed the most westerly, and its ruler was Bâtû Khan, established on the Volga. Sartak is known in the history of the Mongols as Bâtû's eldest son, and was appointed his successor, though he died immediately after his father (1255). The story of Sartak's profession of Christianity may have had some kind of foundation; it was currently believed among the Asiatic

¹ A detailed notice of such documents was published by M. Edm. Cousse-maker of Lille. See remarks by M. D'Arvezac in *Bull. de la Soc. de Géog.*, 2d vol. for 1863, pp. 569-570.

² The country of Flanders was at this time a fief of the French crown (see Natalis de Wailly, *Notes on Joinville*, p. 576). William's mother-tongue may probably have been Flemish. But this cannot be proved by his representation to Mangu Khan (p. 361) that certain *Teutonici* who had been carried away as slaves by a Tartar chief were *nostræ lingue*, as Dr Franz Schmidt inclines to think.

Christians, and it is alleged by Armenian writers that he had been brought up and baptized among the Russians.

Rubruk and his party landed at Soldaia, or Sûdâk, on the Crimean coast, a port which was then the chief seat of the communication between the Mediterranean states and what is now southern Russia. Equipped with horses and carts for the steppe, they travelled successively to the courts of Sartak and of Bâtû, respectively on the hither and further banks of the Volga, banded from one to the other, and then referred to the Great Khan himself, an order involving the enormous journey to Mongolia. The actual travelling of the party from the Crimea to the khan's court near Karakorum cannot have been, on a rough calculation, less than 5000 miles, and the return journey to Ayas in Cilicia would be longer by 500 to 700 miles. The chief dates to be gathered from the narrative are as follows:—embark on the Euxine, May 7, 1253; reach Soldaia, 21; set out thence, June 1; reach camp of Sartak, July 31; begin journey from camp of Bâtû eastward across steppe, September 16; turn south-east, November 1; reach Talas river, 8; leave Cailac¹ (south of Lake Balkash), 30; reach camp of Great Khan, December 27; leave camp of Great Khan on or about July 10, 1254; reach camp of Bâtû again, September 16; leave Sartak's camp, November 1; at the Iron Gate (Derbend) 13; Christmas spent at Nakhshivân (under Ararat); reach Antioch (from Ayas, *via* Cyprus), June 29, 1255; reach Tripoli, August 15.

The camp of Batu was reached near the northernmost point of his summer marches, therefore about Ukek near Saratoff (see *Marco Polo*, Prol., chap. iii. note 4). Before the camp was left they had marched with it five weeks down the Volga. The point of departure would lie on that river somewhere between 48° and 50° N. lat. The route taken lay eastward by a line running north of the Caspian and Aral basins; then from about 70° E. long. south (with some easting) to the basin of the Talas river; thence across the passes of the Kirghiz Ala-tau and south of the Balkash Lake to the Ala-kul and the Baratlula Lake (Ebi-nûr). From this the travellers struck north across the Barluk, or the Orkchuk Mountains, and thence, passing south of the modern Kobdo, to the valley of the Jabkan river, whence they emerged on the plain of Mongolia, coming upon the Great Khan's camp at a spot ten days' journey from Karakorum and bearing in the main south from that place, with the Khangai Mountains between.

This route is of course not thus defined in the narrative, but is a laborious deduction from the facts stated therein. The key to the whole is the description given of that central portion intervening between the basin of the Talas and the Lake Ala-kul, which enables the topography of that region, including the passage of the Ili, the plain south of the Balkash, and the Ala-kul itself, to be identified past question.²

The return journey, being made in summer, after retraversing the Jabkan valley,³ lay much farther to the north, and passed north of the Balkash, with a tolerably straight course probably, to the mouths of the Volga. Thence the party travelled south by Derbend, and so by Shamakhi to the Araxes, Nakhshivan, Erzingan, Sivas, and Iconium, to the coast of Cilicia, and eventually to the port of Ayas, where they embarked for Cyprus and Syria. St Louis had returned to France a year before.

We have alluded to Roger Bacon's mention of Friar William of Rubruk. Indeed, in the geographical section of the *Opus Majus* (c. 1262) he cites the traveller repeatedly and copiously, describing him as "frater Wilhelmus quem dominus rex Francie misit ad Tartaros, Anno Domini 1253 . . . qui perlustravit regiones orientis et aquilonis et loca in medio his annexa, et scripsit hæc prædicta illustri regi; quem librum diligenter vidi et cum ejus auctore contuli" (*Opus Majus*, ed. Jebb, 1733, pp. 190–191). Add to this William's own incidental particular as to his being (like his precursor, Friar John of Pian Carpaine, see vol. v. p. 182) a very heavy man (*ponderosus valde*), and we know no more of his personality except the abundant indications of character afforded by the story itself. These paint for us an honest, pious, stout-hearted, acute, and most intelligent observer, keen in the acquisition of knowledge, the author in fact of one of the best narratives of travel in existence. His language indeed is Latin of the most un-Ciceronian quality,—dog-Latin we fear it must be called; but, call it what we may, it is in his hands a pithy and transparent medium of expression. In spite of all the difficulties of communi-

cation, and of the badness of his *turgemannus* or dragoman,⁴ he gathered a mass of particulars, wonderfully true or near the truth, not only as to Asiatic nature, geography, ethnography, and manners, but as to religion and language. Of his geography a good example occurs in his account of the Caspian (eagerly caught up by Roger Bacon), which is perfectly accurate, except that he places the hill country occupied by the Mulâhids, or Assassins, on the eastern instead of the southern shore. He explicitly corrects the allegation of Isidore that it is a gulf of the ocean: "non est verum quod dicit Ysidorus . . . nusquam enim tangit oceanum, sed undique circumdatur terra" (265).⁵ Of his interest and acumen in matters of language we may cite examples. The language of the Pascatir (or Bashkirds) and of the Hungarians is the same, as he had learned from Dominicans who had been among them (274).⁶ The language of the Ruthenians, Poles, Bohemians, and Slavonians is one, and is the same with that of the Wandals, or Wends (275). In the town of Equius (immediately beyond the Ili, perhaps Aspara)⁷ the people were Mohammedans speaking Persian, though so far remote from Persia (281). The Yugurs (or Ugurs) of the country about Cailac (see note above) had formed a language and character of their own, and in that language and character the Nestorians of that tract used to perform their office and write their books (281–2). The Yugurs are those among whom are found the fountain and root of the Turkish and Comanian tongue (289). Their character has been adopted by the Moghals. In using it they begin writing from the top and write downwards, whilst line follows line from left to right (286). The Nestorians say their service, and have their holy books, in Syriac, but know nothing of the language, just as some of our monks sing the mass without knowing Latin (293). The Tibet people write as we do, and their letters have a strong resemblance to ours. The Tangut people write from right to left like the Arabs, and their lines advance upwards (329). The current money of Cathay is of cotton paper, a palm in length and breadth, and on this they print lines like those of Mangu Khan's seal:—"imprimunt lineas sicut est sigillum Mangu"—a remarkable expression. They write with a painter's pencil and combine in one character several letters, forming one expression:—"faciunt in una figura plures literas comprehendentes unam dictionem,"—a still more remarkable utterance, showing an approximate apprehension of the nature of Chinese writing (329).

Yet this sagacious and honest observer is denounced as an ignorant and untruthful blunderer by Isaac Jacob Schmidt (a man, no doubt of useful learning, of a kind rare in his day, but narrow and wrong-headed, and in natural acumen and candour far inferior to the 18th-century friar whom he maligns), simply because the evidence of the latter as to the Turkish dialect of the Ugurs traversed a pet heresy, long since exploded, which Schmidt entertained, viz., that the Ugurs were by race and language Tibetan.⁸

The narrative of Rubruk, after Roger Bacon's copious use of it, seems to have dropped out of sight. It has no place in the famous collections of the 14th century, nor in the earlier *Speculum Historiale* of Vincent of Beauvais, which gives so many others of the Tartarian ecclesiastical itineraries. It first appeared imperfectly in Hukluyt (1600), as we have mentioned. But it was not till 1839 that any proper edition of the text was published. In that year the *Recueil de Voyages* of the Paris Geographical Society, vol. iv., contained a thorough edition of the Latin text, and a collation of the few existing MSS., put forth by M. D'Avezac, with the assistance of two young scholars, since of high distinction, viz., Françoise-Michel and Thomas Wright. But there is no commentary, such as M. D'Avezac attached, in his own incomparable fashion, to the edition of Friar John of Pian Carpaine in the same volume; nor has there ever been any properly annotated edition of a traveller so worthy of honour. Richthofen in his *China*, i. 602–604, has briefly but justly noticed the narrative of Rubruk. A French version with some notes, issued at Paris in 1877, in the *Bibliothèque Orientale Elzévirienne*, if named at all, can only be mentioned as beneath contempt. The task is one which the present writer has long contemplated, but now with but slender hope of accomplishment. (Since this was in type the writer has received from Dr. Franz Max Schmidt an admirable monograph by him, *Ueber Rubruks Reise* (Berlin, p. 93), extracted from vol. xx. of the *Ztschr. Geog. Soc. Berl.*, and has greatly profited by it in the revision of the article in proof.) (H. Y.)

RUBY. This name is applied by lapidaries and jewellers to two distinct minerals, which may be distinguished as the true or Oriental ruby and the spinel ruby. The former is a red variety of corundum or native alumina, of

⁴ "Ego enim percepi postea, quando incepi aliquantulum intelligere idioma, quod quando dicebam unum ipse totum aliud dicebat, secundum quod ei occurrebat. Tum, videns periculum loquendi per ipsum, elegi magis tacere" (248–249).

⁵ The page references in the text are to D'Avezac's edition of the Latin (see below).

⁶ The Bashkirds now speak a Turkish dialect; but they are of Finnish race, and it is quite possible that they then spoke a language akin to Magyar. There is no doubt that the Musliman historians of that age identified the Hungarians and the Bashkirds (e.g., see extracts from Juvani and Rashiduddin in App. to D'Ohsson's *Hist. des Mongols*, ii. 620–623). The Bashkirds are also constantly coupled with the *Majâr* by Abulghâzi. See Fr. tr. by Desmaisons, pp. 19, 140, 180, 189.

⁷ *Asp = Equus*. Aspara is often mentioned by the historians of Timur and his successors; its exact place is uncertain, but it lay somewhere on the Ili frontier. Dr. F. Schmidt thinks this identification impossible; but one of his reasons—viz., that Equus was only one day from Cailac—appears to be a misapprehension of the text.

⁸ See *Forschungen im Gebiete . . . der Völker Mittel-Asiens*, St Petersburg, 1824, pp. 40–43.

¹ Cailac, where Rubruk halted twelve days, is undoubtedly the Kayalik of the historians of the Mongols, the position of which is somewhat indefinite. The narrative of Rubruk shows that it must have been near the modern Kopal.

² See details in *Cathay and the Way Thither*, pp. ccxi–ccxiv., and Schuyler's *Turkistan*, i. 402–405. Mr Schuyler points out the true identification of Rubruk's river with the Ili, instead of the Chu, which is a much smaller stream; and other amendments have been derived from Dr. F. M. Schmidt (see below).

³ So the present writer interprets what Rubruk says:—"Our going was in winter, our return in summer, and that by a way lying very much farther north, only that for a space of fifteen days' journey in going and coming we followed a certain river between mountains, and on these there was no grass to be found except close to the river." The position of the Chagan Takol or upper Jabkan seems to suit these facts best; but Mr Schuyler refers them to the upper Irish, and Dr. F. Schmidt to the Ullungur.

great rarity and value, while the latter is an aluminate of magnesium, inferior to the true ruby in hardness and much less esteemed as a gem stone. With ancient writers the confusion was even greater, for they appear to have classed together under a common name, such as the *carbunculus* of Pliny or the *ἀσθαῖς* of Greek writers, not only our two kinds of ruby but also garnets and other inferior stones of a brilliant fiery colour. By modern mineralogists it has come to be understood that when the word ruby is used without any qualifying prefix the true or Oriental stone is invariably indicated.

The Oriental ruby, like all other varieties of corundum, crystallizes in the rhombohedral system; but, as it usually occurs as small pebbles or rounded fragments, the crystalline form can rarely be traced. Its colour varies from deep cochineal to pale rose red, in some cases inclining to purple, the most valued tint being that known to experts as pigeon's blood colour. On exposure to a high temperature the ruby becomes green, but regains its original colour on cooling—a behaviour which is consistent with the supposition that the stone owes its colour to the presence of oxide of chromium, and indeed in artificial rubies the required tint is always obtained by the use of some compound of chromium. When a ruby of the most esteemed colour is properly viewed through a dichroscope, the colour is resolved into a carmine and an aurora red, or red inclining to orange. By this test the true ruby may be distinguished from spinel and garnet, since these minerals crystallize in the cubic system and therefore are not dichroic. Another mode of distinction is suggested by the high density of corundum: the specific gravity of the true ruby reaches or even rises slightly above 4, and thus greatly exceeds that of either spinel or garnet. But perhaps the simplest test is afforded by its great hardness ($H=9$): the sharp edge of a corundum crystal will readily scratch either a spinel or a garnet, but has no effect on a ruby. The true ruby has a very high index of refraction ($\mu=1.78$), and to this character is due the remarkable lustre of the polished stone. Mr Crookes has shown that the ruby is brilliantly phosphorescent when subjected to radiant discharge in a properly exhausted vessel, and curiously enough the red light emitted is equally vivid whatever be the colour of the corundum under experiment. The microscopic structure of the ruby has been studied by Mr Sorby, who finds that the stone contains fluid cavities and numerous crystallized enclosures of other minerals (*Proc. Roy. Soc.*, xvii., 1869, p. 291).

The Oriental ruby is a mineral of very limited distribution, its principal localities being confined to the kingdom of Burmah. The most important ruby mines are situated at Kyat Pyen, about 70 miles to the north-east of Mandalay; there are also mines at Mookop, a little farther north, and others in the Sagyin Hills, within 16 miles of Mandalay. In all these localities the rubies occur in association with sapphires and other precious stones, forming a gem-bearing gravel which is dug up and washed in very primitive fashion. By far the larger number of the rubies are of small size, and the larger stones are generally flawed. All rubies exceeding a certain weight were the property of the king of Burmah. The mines were jealously watched, and it was difficult for Europeans to obtain access to them; but some of the Ava workings were visited and described many years ago by Père Giuseppe d'Amato, and more recently those near Mandalay have been described by Mr Bredmeyer, who was officially connected with them (Ball). It is stated in the older works on mineralogy that rubies occur in the Capelan Mountains,—the Kyat Pyen locality. In peninsular India there are but few localities that yield rubies, but they have been reported from the corundum mines of the Salem district in Madras and from Mysore. In Ceylon they occur with sapphires, but are rarer than those gems, and the Ceylon rubies are not usually of good colour. Rubies have been brought from Gandamak, in Afghanistan, but most of the stones reputed to be Afghan rubies are merely spinels,—as also are many of the Burmese rubies.

In 1871 some remarkable deposits of corundum were discovered by Col. C. W. Jenks in Macon co., North Carolina. Rubies,

sapphires, and large pebbles of coarse corundum were found in the bed of a river near a large mass of serpentine which afterwards became known as Corundum Hill, and these pebbles were eventually traced to certain veins in the serpentine. The corundum occurred crystallized *in situ*, but was rarely of such a colour as would entitle it to be called ruby. Mr G. F. Kunz, who has lately written an article on American precious stones, states that rubies and sapphires have also been found at Vernon, New Jersey; near Helena, Montana; at Santa Fé, New Mexico; in southern Colorado; and in Arizona.

Australia has occasionally yielded true rubies, but mostly of small size and inferior quality. In Victoria they have been found in the drifts of the Beechworth gold fields and at the Berwick tin mine, Wallace's Creek; while in New South Wales they occur at Mudgee, in the Cudgong and some of its tributaries, and at Tumberumba, co. Wynyard. A magenta-coloured turbid ruby from Victoria is known under the name of "barklyite."

The "star ruby" is a rather cloudy variety from Ceylon, exhibiting when cut *en cabochon* a luminous star of six rays, reflected from the convex surface of the stone.

The largest ruby known in Europe is said to be one of the size of a small hen's egg, which was presented by Gustavus III. of Sweden to the empress of Russia on the occasion of his visit to St Petersburg. Rubies of larger size have been described by Tavernier and other Oriental travellers, but it is probable that in many cases spinels have been mistaken for true rubies. There seems no doubt that the great historic ruby set in the Maltese cross in front of the imperial state crown of England is a spinel. This stone was given to Edward the Black Prince by Pedro the Cruel, king of Castile, on the victory of Najera in 1367, and it was afterwards worn by Henry V. at the battle of Agincourt, when it narrowly escaped destruction.

The spinel ruby has been described in the article MINERALOGY (vol. xvi. p. 386, sp. 93). The spinels used for jewellery are mostly obtained in Burmah, where they occur as octahedral crystals or as water-worn pebbles in association with the true ruby, for which they are often mistaken. They are also found in the gem-bearing gravels of Ceylon, Victoria, and New South Wales. The delicate rose-pink variety known as balas ruby was worked for centuries in Badakhshan, but the operations appear to have been suspended of late years. The mines are situated on the river Shighnan, a tributary of the Oxus. It is commonly said that the name "balas" or "balash" is a corruption of Badakhshan, while others derive it from Balkh.

The Oriental ruby has always been esteemed of far higher value than any other precious stone. A ruby of perfect colour, weighing five carats, is worth at the present day ten times as much as a diamond of equal weight (Streeter). As the weight of the stone increases, its value rapidly rises, so that rubies of exceptional size command enormous prices. There is consequently much temptation to replace the true stone by spinel or garnet or even paste. By means of oxide of chromium an excellent imitation of the colour of the ruby is obtained; and, though the ordinary "strass," or fine lead-glass, is very soft, and therefore soon loses its lustre, it is yet possible to produce a paste consisting of silicate of alumina which is almost as hard as rock crystal.

It is an interesting fact that the chemist has frequently succeeded in causing alumina to assume artificially many of the physical characteristics of the native ruby. As far back as 1837 M. Gaudin reproduced the ruby on a small scale by exposing ammonia-alum to the heat of the oxyhydrogen blowpipe, whereby he obtained fused alumina which was readily coloured by the addition of oxide of chromium. A different method was followed by Ebelmen. He dissolved alumina in boric acid at a high temperature, and on the cooling of the mass obtained the alumina in a crystallized form; while if chromate of ammonium was present the crystals became veritable ruby. MM. Sainte-Claire Deville and Caron heated a mixture of fluoride of aluminium, fluoride of chromium, and boric acid, and thus obtained a fluoride of boron, which, being volatile, readily escaped, and left a solid residue of alumina coloured by the chrome. These, however, were only laboratory experiments, and it was reserved for MM. Frémy and Feil, in 1878, to reproduce the ruby and sapphire on a scale suggestive of some commercial importance. By heating a mixture of artificial alumina and red lead in a fireclay crucible, they obtained a vitreous silicate of lead (the silica being derived from the crucible) and crystallized alumina, while the addition of bichromate of potassium caused this alumina to assume the coveted tint of the ruby.

For a general description of the ruby see E. Jannettaz, *Diamant et Pierres Précieuses* (1881); Kluge, *Handbuch der Edelsteinkunde* (1860); Schrauf, *Edelsteinkunde* (1869); Church, *Precious Stones* (1883); Streeter, *Precious Stones and Gems* (4th ed., 1884). For Indian localities see Ball's *Economic Geology*, being vol. iii. of the *Manual of the Geology of India* (1881); for Australian localities, *Liversidge's Minerals of New South Wales* (2d ed., 1882); for United States rubies, *Quart. Jour. Geol. Soc. Lond.*, vol. xxx., 1874, p. 308, and *American Jour. Science*, ser. iii. vol. iv. 1872, pp. 109, 178, and Kunz's article in *Mineral Resources of the United States*, by A. Williams, Jun. (1883). For the history of the stone consult King's *Natural Hist. of Precious Stones* (1868), and for artificial rubies, *Comptes Rendus*, vol. lxxv. 1877, p. 1028. (F. W. E.*)

RÜCKERT, FRIEDRICH (1788–1866), an eminent German poet, was born at Schweinfurt on the 16th May 1788. He was educated at the gymnasium of his native place and at the universities of Würzburg and Heidelberg, where he studied law and philology. Having taken his degree, he went to the university of Jena as a “privat-docent”; but this position he soon abandoned. For some time he worked in connexion with the *Morgenblatt* at Stuttgart. Nearly the whole of the year 1818 he spent in Rome, where he devoted himself to study, especially to the study of the popular poetry of Italy; and afterwards he lived for several years at Coburg. He was appointed a professor of Oriental languages at the university of Erlangen in 1826, and in 1841 he was called to a similar position in Berlin, where he was also made a privy councillor. In 1849 he resigned his professorship at Berlin, and went to live on his estate near Coburg. He died on the 31st January 1866. When Rückert began his literary career, Germany was engaged in her life-and-death struggle with Napoleon; and in his first volume, *Deutsche Gedichte*, published in 1814 under the name of Freimund Raimar, he gave vigorous expression to the prevailing sentiment of his countrymen. In 1816 appeared *Napoleon, eine politische Komödie in drei Stücken*, and in 1817 the *Kranz der Zeit*. He issued a collection of poems, *Oestliche Rosen*, in 1822; and in 1834–38 his *Gesammelte Gedichte* were published in six volumes, a selection from which has passed through many editions. Rückert, who was master of thirty languages, made his mark chiefly as a translator of Oriental poetry, and as a writer of poems conceived in the spirit of Oriental masters. Much attention was attracted by *Die Verwandlungen des Abu Seid*, a translation of Hariri's *Makamen* (1826), *Nal und Damajanti*, an Indian tale (1828), *Amrilkans, der Dichter und König* (1843), and *Hamasa, oder die ältesten arabischen Volkslieder* (1846). Among his original poems dealing with Oriental subjects are *Morgenländische Sagen und Geschichten* (1837), *Erbauliches und Beschauliches aus dem Morgenland* (1836–38), *Rostem und Sohrab, eine Heldengeschichte* (1838), and *Brahmanische Erzählungen* (1839). The most elaborate of his works is *Die Weisheit des Brahmanen*, published in six volumes in 1836–39. In 1843–45 he issued several dramas, all of which are greatly inferior to the work to which he owes his distinctive place in German literature. At the time of the Danish war in 1864 he wrote *Ein Dutzend Kampf-Lieder für Schleswig-Holstein*, which, although published anonymously, produced a considerable impression. After his death many poetical translations and original poems were found among his papers, and several collections of them were published. Rückert lacked the simple and natural feeling which is characteristic of all the greatest lyrical poets of Germany. But he had a certain splendour of imagination which made Oriental poetry congenial to him, and he has seldom been surpassed in his power of giving rhythmic expression to ideas on the conduct of life. As a master of poetical style he ranks with German writers of the highest class. There are hardly any lyrical forms which are not represented among his works, and in all of them, the simplest and the most complex, he wrote with equal ease and grace.

A complete edition of Rückert's poetical works appeared in Frankfurt in 1868–69. See Forstlge, *Rückert und seine Werke* (1867); Beyer, *Friedrich Rückert, ein biographisches Denkmal* (1868); *Neue Mittheilungen über Rückert* (1873); and *Nachgelassene Gedichte Rückerts und neue Beiträge zu dessen Leben und Schriften* (1877); Boxberger, *Rückert-Studien* (1878).

RÚDAGÍ (d. 954). Hakím Mohammed Faríd-eddín ‘Abdalláh, the first great genius of modern Persia, was born in Rúdag, a village in Transoxiana about 870–900, —totally blind, as most of his biographers assert, although the fine distinction of colours and the minute description

of the various tints and shades of flowers in his poems flatly contradict the customary legend of the “blind minstrel.” In his eighth year he knew the whole Korán by heart and had begun to write verses. He had besides a wonderful voice which enraptured all hearers, and he played in a masterly way on the lute. The fame of these accomplishments at last reached the ear of the Sámánid Nasr II. bin Ahmad, the ruler of Khorásán and Transoxiana (913–942), who drew the poet to his court and distinguished him by his personal favour. Rúdagí became his daily companion, rose to the highest honours, and grew rich in worldly wealth. He received so many costly presents that he could allow himself the extravagance of keeping two hundred pages, and that four hundred camels were necessary to carry all his property. In spite of various predecessors he well deserves the title of “father of Persian literature,” since he was the first who impressed upon every form of epic, lyric, and didactic poetry its peculiar stamp and its individual character. He is also said to have been the founder of the “*diwán*,” that is, the typical form of the complete collection of a poet's lyrical compositions in a more or less alphabetical order which prevails to the present day among all Mohammedan writers. His poems filled, according to all statements, one hundred volumes and consisted of one million three hundred thousand verses; but of this there remain only fifty-two *kasidas*, *ghazals*, and *rubá'is*; of his epic masterpieces we have nothing beyond a few stray lines found here and there as illustrations of ancient Persian words and phrases in native dictionaries. But the most serious loss is that of his translation of Ibn Mukaffa's Arabic version of the old Indian fable book *Kalilah and Dimnah*, which he put into Persian verse at the request of his royal patron, and for which he received the handsome reward of 40,000 dirhems. In his *kasidas*, which are all devoted to the praise of his sovereign and friend, Rúdagí has left us unequalled models of a refined and delicate taste, very different from the often bombastic compositions of later Persian encomiasts, and these alone would entitle him to a foremost rank among the poets of his country; but his renown is considerably enhanced by his odes and epigrams. Those of a didactic tendency express in well-measured lines a sort of Epicurean philosophy—in the loftiest sense of the word—on human life and human happiness; more charming still are the purely lyrical pieces, sweet and fascinating songs, which glorify the two everlasting delights of glowing hearts and cheerful minds—love and wine. Rúdagí survived his royal friend, and died long after the splendid days of Nasr's patronage, the time of wealth and luxury, had passed away—poor and forgotten by the world, as one of his poems, a beautiful elegy, seems to indicate—in 954.

A complete edition of all the extant poems of Rúdagí, in Persian text and metrical German translation, together with a biographical account, based on forty-six Persian MSS., is found in Dr Ethé's “*Rúdagí der Sámánidendichter*” (*Göttinger Nachrichten*, 1873, pp. 663–742).

RÜDD, or **RED-EYE** (*Leuciscus erythrophthalmus*), a fish of the family of Carps, generally spread over Europe, north and south of the Alps, also found in Asia Minor, and extremely common in suitable localities, viz., still and deep waters with muddy bottom. When adult, it is readily recognized by its deep, short body, golden-coppery tint of the whole surface, red eyes, and scarlet lower fins; the young are often confounded with those of the roach, but the pharyngeal teeth of the rudd stand in a double row, and not in a single one, as in the roach; also the first dorsal rays are inserted distinctly behind the vertical line from the root of the ventral fin. The anal rays are from thirteen to fifteen in number, and the scales in the lateral line from thirty-nine to forty-two. The rudd is a

fine fish, but little esteemed for food, and very rarely exceeds a length of 12 inches or a weight of 2 lb. It feeds on small freshwater animals and soft vegetable matter, and spawns in April or May. It readily crosses with the white bream, more rarely with the roach and bleak.

RUDDIMAN, THOMAS (1674–1758), an eminent Scottish scholar, was born in October 1674, at Raggal, in the parish of Boyndie, Banffshire, where his father was a farmer. He studied Latin eagerly at the school of his native parish, and when sixteen started off to walk to Aberdeen, there to compete for a college bursary. On the way he was attacked by Gipsies, robbed of a guinea, which was all he had, and otherwise very cruelly treated; but he persevered in his journey, reached Aberdeen, and competed for and won the bursary. He then entered the university, and four years afterwards—on 21st June 1694—received the degree of M.A. For some time he acted as school-master at Laureneckirk in Kincardine. There he chanced to make the acquaintance of Dr Pitcairne, of Edinburgh, who persuaded him to remove to the Scottish capital, where he obtained the post of assistant in the Advocates' Library. As his salary was only £8, 6s. 8d. per annum, he was forced to undertake additional employment. He engaged in miscellaneous literary work, took pupils, and for some time acted as an auctioneer. His chief writings at this period were editions of Wilson's *De Animi Tranquillitate Dialogus* (1707), and the *Cantici Solomonis Paraphrasis Poetica* (1709) of Arthur Johnstone (ob. 1641), editor of the *Deliciæ Poetarum Scotorum*.

In 1714 he published *Rudiments of the Latin Tongue*, which is even yet his best known work. This was intended to be an easy introduction to Latin grammar, and was so successful that it at once superseded all others. Under various forms it has been in use, down to our own day, in the schools of Scotland. In 1715 he edited, with notes and annotations, the works of George Buchanan in two volumes folio. As Ruddiman was a Jacobite, the liberal views of Buchanan seemed to him to call for frequent censure. That censure is often rather implied than openly expressed; but it excited much opposition. A society of scholars was formed in Edinburgh to "vindicate that incomparably learned and pious author from the calumnies of Mr Thomas Ruddiman" by publishing a correct edition of his works. This they never did; but a number of obscure writers from this time attacked Ruddiman with great vehemence. He replied; and it was not till the year before his death that he said his "last word" in the controversy.

His worldly affairs, meanwhile, grew more and more prosperous. He founded (1715) a successful printing business, and after some time was appointed printer to the university. He acquired the *Caledonian Mercury* in 1729, and in 1730 was appointed keeper of the Advocates' Library, which post, owing to failing health, he resigned in 1752. He died at Edinburgh, 19th January 1758, and was interred in Greyfriars churchyard, where in 1806 a tablet was erected to his memory.

Besides the works mentioned, the following writings of Ruddiman deserve notice:—an edition of Gavin Douglas's *Æneid* of Virgil (1710); the editing and completion of Anderson's *Selectus Diplomatum et Numismatum Scotiæ Thesaurus* (1739); *Catalogue of the Advocates' Library* (1733–42); an edition of Livy, famed for its "immaculate purity," in 4 vols. (1751). Ruddiman was for many years the representative scholar of Scotland. Writing in 1766, Dr Johnson, after reproving Boswell for some bad Latin, significantly adds—"Ruddiman is dead." When Boswell proposed to write Ruddiman's life, "I should take pleasure in helping you to do honour to him," said Johnson.

See Chalmers's *Life of Ruddiman* (1794); *Scots Magazine*, January 7, 1757; Boswell's *Life of Johnson*.

RUDE, FRANÇOIS (1784–1855), a French sculptor of great natural talent and force of character, but of an ignorance

as to all that did not immediately concern his art which can best be described as out of date. He was born at Dijon, 4th January 1784, and came therefore in his youth under the influence of the democratic and Napoleonic ideals in their full force. Till the age of sixteen he worked at his father's trade as a stovemaker, amusing himself with modelling in his free hours only; but in 1809 he went up to Paris from the Dijon school of art, and became a pupil of Castellier, obtaining the Great Prize in 1812. After the second restoration of the Bourbons he retired to Brussels, where he got some work under the architect Van der Straeten, who employed him to execute nine bas reliefs in the palace of Tervueren, which he was then engaged in building. At Brussels Rude married Sophie Fremiet, the daughter of a Bonapartist compatriot, to whom he had many obligations, but, obtaining with difficulty work so ill-paid that it but just enabled him to live, he gladly availed himself of the opportunity of return to Paris, where in 1827 a statue of the Virgin for St Gervais and a Mercury Fastening his Sandals obtained much attention. His great success dates, however, from 1833, when he received the cross of the Legion of Honour for his statue of a Neapolitan Fisher Boy playing with a Tortoise, which also procured for him the important commission for all the ornament and one bas relief of the Arc de l'Étoile. This relief, a work full of energy and fire, immortalizes the name of Rude. Amongst other productions, we may mention the statue of Monge, 1848, Jeanne d'Arc (in garden of Luxembourg), 1852, a Calvary in bronze for the high altar of St Vincent de Paul, 1855, as well as Hebe and the Eagle of Jupiter, Love Triumphant, and Christ on the Cross, all of which appeared at the Salon of 1857 after his death. He had worked all his life long with the most extraordinary energy and given himself no rest in spite of the signs of failing health, and at last, on the 3d November 1855, he died suddenly with scarcely time to cry out. One of his noblest works, and easily accessible, is the tomb of Cavaignac, on which he placed beside his own the name of his favourite pupil Christophe. Although executed in 1840, this was not erected at Montmartre till the year after Rude's own death. His Louis XIII., a life size statue, cast in silver, is to be seen at the Duc de Luynes's chateau at Dampierre. Cato of Utica stands in the gardens of the Tuileries, and his Baptism of Christ decorates a chapel of the Madeleine.

RUDE STONE MONUMENTS. The raising of commemorative monuments of such an enduring material as stone is a practice that may be traced in all countries to the remotest times. The highly sculptured statues, obelisks, and other monumental erections of modern civilization are but the lineal representatives of the unhewn monoliths, dolmens, cromlechs, &c., of prehistoric times. Judging from the large number of the latter that have still survived the destructive agencies (notably those of man himself) to which they have been exposed during so many ages, it would seem that the ideas which led to their erection had as great a hold on humanity in its earlier stages of development as at the present time. In giving some idea of these rude monuments in Britain and elsewhere, it will be convenient to classify them as follows (see vol. ii. p. 383, figs. 1–4). (1) Isolated pillars or monoliths of unhewn stones raised on end are called *Menhirs* (*maen*, a stone, and *hir*, long). (2) When these monoliths are arranged in lines they become *Alignments*. (3) But if their linear arrangement is such as to form an enclosure (*enceinte*), whether circular, oval, or irregular, the group is designated by the name of *Cromlech* (see CROMLECH). (4) Instead of the monoliths remaining separate, they are sometimes placed together and covered over by one or more capstones so as to form a rude chamber; in this case

the monument is called a *Dolmen* (*daul*, a table, and *maen*, a stone). This megalithic chamber is sometimes partially or wholly imbedded in a mound of earth or stones so as to form a tumulus or cairn. As, however, there are many tumuli and cairns which do not contain megalithic chambers, we have only partially to deal with them under the category of rude stone monuments.

Menhirs.—Rude monoliths fixed on end (see vol. ii. p. 383, fig. 1) have been used in all ages for a variety of purposes, commemorative and religious. Stone pillars were also used ceremonially on the accession of kings and chiefs. In Scotland, when stones were thus used, they were called Tanist Stones, the most celebrated of which was the Lia Fail, formerly at Scone (now at Westminster Abbey), on which the kings of Scotland used to be crowned. We read also of Hare or Hoer Stones, Cambus or Camus Stones, Cat (*catb*, battle) Stones, "Witch Stanes," "Druid Stanes," &c. The Hawk's Stane, or *Saxum Falconis*, at St Madoes, Perthshire, was erected in memory of the defeat of the Danes at Luncarty, and a monolith now standing on the field of Flodden is said to mark the place where King James fell. When menhirs were grouped together their number was often significant, *e.g.*, twelve (Josh. iv. 5) or seven (Herod., iii. 8). Some standing stones are found to have been artificially perforated, and these superstition has invested with some curious functions. As examples of this class may be mentioned the famous Stone of Odin, near the circle of Stennis, the Clach-Charra, or Stone of Vengeance, at Onich near Balachulish in Argyllshire, and Men-en-tol in Cornwall. Two rude monoliths in Scotland bear inscriptions,—the famous Newton Stone in the district of Garioch, and the Cat Stane near Edinburgh. Many others have cup-marks and spirals or concentric circles. In Ireland, Wales, and the north of Scotland, they are occasionally found with ogam inscriptions, and in the north-east of Scotland (Pictland) with symbolical figures, which were subsequently continued on the beautifully sculptured stones of early Christian date which are peculiar to that locality.

Menhirs are found in all megalithic countries. In the British Isles they are very abundant, more especially in the less cultivated districts. In France over 1600 isolated examples have been recorded, of which about the half, and by far the most remarkable, are within the five departments which constitute Brittany. In the rest of France they are generally small, and not to be compared in grandeur to those of Brittany. At Locmariaquer (Morbihan) is the largest menhir in the world. It is in the form of a rude but smooth-sided obelisk, and lies on the ground broken into four portions, the aggregate length of which amounts to 20·50 metres (about 67 feet). It was made of granite, foreign to the neighbourhood, and its weight, according to the most recent calculations, amounted to 347,531 kilogrammes or 342 tons (*L'Homme*, 1885, p. 193). The next largest menhir is at Plésidy (Côtes-du-Nord), measuring about 37 feet in height. Then follows a list of sixty-seven gradually diminishing to 16 feet in height, of which the first ten (all above 26 feet) are in Brittany. As regards form, these menhirs vary greatly. Some are cylindrical, as the well-known "pierre du champ Dolent" at Dol (height 30 feet), and that of Cadiou in Finistère (28 feet); while that of Penmarch (26 feet) takes the shape of a partially expanded fan. On the introduction of Christianity into France its adherents appear to have made use of these menhirs at an early period; many of them at present support a cross, and some a Madonna. The scattered positions of some monoliths and the no less singular grouping of others show that, although they were sometimes used as landmarks, this was only a secondary function. It is not uncommon to find a monolith overtopping a tumulus, thus simulating the Bauta (grave or battle) Stones of Scandinavia. In England, monoliths are often associated with the stone circles, as the King's Stone at Stanton Drew, Long Meg at Little Salkeld, the Ring Stone at Avebury, &c. One of the finest British monoliths stands in the churchyard of Rudston, Yorkshire. Examples of a large size are met with in Algeria, Morocco, India, Central Asia, &c.

Alignments.—The most celebrated monuments of this class are in the vicinity of Carnac in Brittany. They are situated in groups at Ménez, Kermario, Kerlescant, Erdeven, and St Barbe—all within a few miles of each other, and in the centre of a district containing the most remarkable megalithic remains in the world. The first three groups are supposed by some archaeologists to be merely portions of one original and continuous series of alignments, which extended nearly 2 miles in length in a uniform direction from south-west to north-east. Commencing at the village of Ménez, the menhirs are arranged in eleven rows. At first they stand from 10 to 13 feet above the ground, but, as we advance, they become gradually smaller till they attain only 3 or 4 feet, when they cease altogether. After a vacant space of about 350 yards we come to the Kermario group, which contains only ten lines, but they are nearly of the same magnitude as at the beginning of the former group. After a still greater interval the menhirs

again appear, but this time in thirteen rows, at the village of Kerlescant. In 1881 M. Felix Gaillard, Plouharnel, made a plan of the alignments at Erdeven, which shows that, out of a total of 1120 menhirs which originally constituted the group, 290 are still standing, 740 fallen, and 90 removed. The menhirs here may be traced for nearly a mile, but their linear arrangement is not so distinct, nor are the stones so large as those at Carnac. About fifty alignments are known in France. At Penmarch there is one containing over two hundred menhirs arranged in four rows. Others, however, are formed of only a single row of stones, as at Kerdouadec, Leuré, and Camaret. The first is 480 m. in length, and terminates at its southern extremity in a kind of croix gammée. At Leuré three short lines meet at right angles. The third is situated on the rising ground between the town of Camaret and the point of Toulanguet. It consists of a base line, some 600 yards long, with forty-one stones (others have apparently been removed), and two perpendicular lines as short offsets. Close to it are a dolmen and a prostrate menhir. These monoliths are all of coarse quartz and of small size, only one, at Leuré, reaching a height of 9 feet. Alignments are also found in other countries. In the Pyrenees they are generally in single file,—mostly straight, but sometimes reptiliform. One at Peyrelade (Bilière) runs in a straight line from north to south for nearly 300 yards, and contains ninety-three stones, some of which are of great size. At St Columb in Cornwall, there is one called the Nine Maidens, which is formed of eight quartz stones, extending in a perfectly straight line for 262 feet. In Britain they are more frequently arranged in double file, or in avenues, leading to or from other megalithic monuments, such as still exist, or formerly existed, at the circles of Avebury, Stonehenge, Shap, Callernish, &c. The only example in England comparable to the great alignments of Carnac is in the Vale of the White Horse in Berkshire. Here the stones, numbering about eight hundred, are grouped in three divisions, and extend over an irregular parallelogram which measures from 500 to 600 yards in length and from 250 to 300 yards in breadth. Sir Henry Dryden describes groups of a similar character in Caithness, as at Garry-whin, Camster, Yarhouse, and the "many stones" at Clyth. Alignments in single and multiple rows have also been observed in Shetland, India, Algeria, &c.

Cromlechs.—Enclosures (*enceintes*) formed of rude monoliths, placed at intervals of a few yards, have generally a circular or oval shape. Rectangular forms are, however, not unknown, examples of which may be seen at Curcunno (Morbihan), near the celebrated dolmen of that name, and at Saint Just (Ille-et-Vilaine). The former measures 37 by 27 yards, and is now composed of twenty-two menhirs, all of which are standing (some fallen ones having been recently restored by the Government). About a dozen menhirs would appear to be wanting. A donkey-shoe-shaped enclosure has been described by Sir Henry Dryden, in the parish of Latheron, Caithness. It is 226 feet long and 110 feet wide in the middle, and the two extremities are 85 feet apart. Stone circles are frequently arranged concentrically, as may be seen in the circle at Kenmore, near Aberfeldy, Perthshire, as well as in many other Scotch, Irish, and Scandinavian examples. More rarely one large circle surrounds secondary groups, without having a common centre, as was the case at Avebury, where the outer circle, 1200 feet in diameter, included two others, each of which contained an inner concentric circle. At Boscawen, in Cornwall, there is a group of circles confusedly attached, and, as it were, partially overlapping each other. Circles may also be connected by an alignment or avenue, as at Stanton Drew, Dartmoor, &c. Cromlechs are often associated with other megalithic monuments; thus at the head of the great Carnac alignments are the remains of a large circle which can be readily traced, notwithstanding that some houses are constructed within its area. In the British Isles and the north of Europe cromlechs frequently surround the dolmens, tumuli, or cairns. A few examples of a dolmen surrounded by one or more concentric circles have also been recorded by M. Cartailhac, in the department of Aveyron in France. Outside the cromlech there is also frequently to be found a circular ditch or vallum, as at Avebury, Stonehenge, Arbor Low, Brogar, &c. The most remarkable megalithic monument of this class now extant is Stonehenge, which differs, however, from its congeners in having the stones of its outer circle and outer oval partially hewn and attached by transverse lintels. The largest cromlech in France stands on the Ile-aux-Moines (Morbihan), in the village of Kergonan. About half of it is destroyed by the encroachment of the houses. The remaining semi-circumference (slightly elliptical) contains thirty-six menhirs from 6 to 10 feet high, and its diameter is about 100 metres (328 feet). Only a few of the British cromlechs exceed these dimensions, among which may be mentioned Avebury (1260 by 1170 feet), Stonehenge (outer circle 300 feet, inner 106 feet), Stanton Drew (360 feet), Brogar (345 feet), Long Meg and her Daughters (330 feet). One near Dumfries, called the Twelve Apostles, also closely approaches the 100-metre size; but, generally speaking, the Scotch and Irish examples are of smaller proportions, rarely

exceeding 100 feet in diameter. That most of the smaller circles have been used as sepulchres has been repeatedly proved by actual excavations, which showed that interments had taken place within their area. It is difficult, however, to believe that this could have been the main object of the larger ones. At Mayborough, near Penrith, there is a circle entirely composed of an immense aggregation of small stones in the form of a gigantic ring enclosing a flat area, about 300 feet in diameter. Near the centre there is a fine monolith, one of several known to have formerly stood there. Of the same type is the Giant's Ring near Belfast, only the ring in this instance is made of earth, and it is considerably larger in diameter (580 feet); the central object is a fine dolmen. It is more probable that such enclosures were used, like many of our modern churches, for the double purpose of burying the dead and addressing the living.

Dolmens.—In its simplest form a dolmen consists of three, four, or five stone supports, covered over with one selected megalith called a capstone or table. A well-known example of this kind in England is Kit's Cotty House, between Rochester and Maidstone, which is formed of three large supports, with a capstone measuring 11 by 8 feet. From this simple form there is an endless variety of upward gradations till we reach the so-called Gaint Graves and Grottes aux Fées, which are constructed of numerous supports and several capstones. A dolmen (*allée couverte*) situated in a plantation at the outskirts of the town of Saumur is composed of four flat supports on each side, with one at the end, and four capstones. The largest capstone measures 7·5 metres in length, 7 in breadth, and 1 in thickness. The chamber is 18 metres long, 6·5 broad, and 3 high. Another near Essé, called "la Roche aux Fées," is equally long, and is constructed of thirty supports, with eight capstones, including the vestibule. Dolmens of this kind are extremely rare in the British Isles, the only one approaching them being Calliagh Birra's House in Ireland. These (generally known as *allées couvertes*) and many other examples of the simple dolmen show no evidence of having been covered over with a mound. When there was a mound it necessitated, in the larger ones, an entrance passage, which was constructed, like the chamber, of a series of side stones or supports and capstones. Some archaeologists maintain that all dolmens were formerly covered with a cairn or tumulus, —a theory which undoubtedly derives some favour from the condition of many examples still extant, especially in France, where all stages of degradation are seen, from a partial to a complete state of denudation. The *allées couvertes* of France, Germany, and the Channel Islands had their entrance at the end; but, on the other hand, the Hunnebedden of Holland had both ends closed and the entrance was on the side facing the sun. The covered dolmens are extremely variable in shape,—circular, oval, quadrangular, or irregular. The entrance gallery may be attached to the end, as in the Grotte de Gavrinis, or to the side, as in the Gaint's Grave (Jettestuer) at Oem near Roskilde. In other instances there is no distinct chamber, but a long passage gradually widening from the entrance; and this may be bent at an angle, as in the dolmen du Rocher (Morbihan). Again, there may be several chambers communicating with one entrance, or two or three separate chambers having separate entrances, and all imbedded in the same tumulus. An excellent example of this kind is the partially destroyed tumulus of Rondosec, near Plouharnal railway station, which contains three separate dolmens. That such variations are not due to altered customs, in consequence of wideness of geographical range, is shown by M. de Mortillet, who gives plans of no less than sixteen differently shaped dolmens (*Musée préhistorique*, pl. 58), all within a confined district in Morbihan.

No dolmens exist in eastern Europe beyond Saxony. They reappear, however, in the Crimea and Circassia, whence they have been traced through Central Asia to India, where they are widely distributed. Similar megalithic structures have also been recognized and described by travellers in Palestine, Arabia, Persia, Australia, the Penrhyn Islands, Madagascar, Peru, &c. The irregular manner in which dolmens are distributed along the western parts of Europe has led to the theory that all these megalithic structures were erected by a special people, but as to the when, whence, and whither of this singular race there is no knowledge whatever. Though the European dolmens have a strong family likeness, however widely apart, they present some characteristic differences in the various countries in which they are found. In Scandinavia they are confined to the Danish lands and a few provinces in the south of Sweden. Here the exposed dolmens are often on artificial mounds, and surrounded by cromlechs which are either circular (*runddysser*) or oval (*langdysser*). In Sweden the *sepulture à galerie* is very rarely entirely covered up as in the giant graves of Denmark.

Hanover, Oldenburg, and Mecklenburg are very rich in the remains of these monuments. At Riestedt, near Uelzen in Hanover, there is, on the summit of a tumulus, a very singular dolmen of oblong form, which measures about 40 feet long and over 6 feet in breadth. Another at Naschendorf, near Wismar, consists of a mound surrounded by a large circle of stones and a

covered chamber on its summit. Remains of a megalithic structure at Rudenbeck, in Mecklenburg, though now imperfect, show that originally it was constructed like an *allée couverte*. It had four supports on each side, two at one end (the other end forming the entrance), and two large capstones. The length had been about 20 feet, breadth 7½ feet, and height from the floor to the under-surface of roof about 3 feet. According to Bonstetten, no less than two hundred of these monuments are found distributed over the three provinces of Lüneburg, Osnabrück, and Stade; and the most gigantic examples in Germany are in the duchy of Oldenburg.

In Holland, with one or two exceptions, they are confined to the province of Drenthe, where between fifty and sixty still exist. Here they get the name of Hunnebedden (Huns' beds). The Borger Hunnebed, the largest of this group, is 70 feet long and 14 feet wide. In its original condition it contained forty-five stones, ten of which were capstones. They are all now denuded, but some show evidence of having been surrounded with a mound containing an entrance passage. Only one dolmen has been recorded in Belgium; but in France their number amounts to 3410. They are irregularly distributed over seventy-eight departments, six hundred and eighteen being in Brittany. In the centre of the country they are also numerous, no less than four hundred and thirty-five being recorded in Aveyron, but they are of much smaller proportions than in the former locality. From the Pyrenees the dolmens are sparsely traced along the north coast of Spain and through Portugal to Andalusia, where they occur in considerable numbers. Crossing into Africa they are found in large groups in Morocco, Algeria, and Tunis. General Faidherbe writes of having examined five or six thousand at the cemeteries of Bou Merzoug, Wady Berda, Tebessa, Gastal, &c.¹ In the Channel Islands every species of megalithic monument is met with. At Mont Cochon, near St Helier, there was lately discovered in a mound of blown sand an *allée couverte*, and close to it a stone circle surrounding a dolmen.² In the British Isles they are met with in many localities, particularly in the west of England, Anglesey, the Isle of Man, Ireland, and Scotland. In the country last named, however, they are not the most striking feature among its rude stone monuments—the stone circles and cisted cairns having largely superseded them.

In the absence of historical knowledge all these megalithic structures were formerly regarded as of Celtic origin. By some they were supposed to have been constructed by the Druids, the so-called priests of the Celts; and hence they were often described, especially since the time of Aubrey and Stukely, under the name of Celtic or Druidical monuments. But this theory is disproved by the fact that the ethnographical range of the Celtic races does not correspond with the geographical distribution of these rude stone monuments. Thus, for example, in Europe, not to speak of their localization in non-Celtic countries, the megaliths occupy an elongated stretch of territory on its western seaboard extending from Pomerania to North Africa. This area crosses at right angles the lands supposed to have been occupied by the Celtic or Aryan races on their westward waves of migration. There can be no doubt from investigations of the contents of dolmens that their primary object was sepulchral, and that the megalithic chambers, with entrance passages, were used as family vaults. Against the theory that any of them were ever used as altars there is *prima facie* evidence in the care taken to have the smoothest and flattest surface of the stones composing the chamber always turned inwards. Moreover, cup marks, and other primitive markings when found on the capstones or supports, are almost invariably on their inside, as, for example, at the dolmens of Keriaval, Kercado, Dol au Marchant, Gavrinis (Morbihan), and the great tumulus at New Grange (Ireland). From its position in the centre of a large circular enclosure no dolmen could be more suggestive of public sacrifices than that within the Giant's Ring near Belfast; yet nothing could be more inappropriate for such a purpose than its capstone, which is in fact a large granite boulder presenting on its upper side an unusually rounded surface.

No chronological sequence can be detected in the evolution of the rude stone monuments, with perhaps the exception of the primitive cist which gave origin to the *allées couvertes*, giant graves, &c., and these again to the tumuli with microlithic built chambers. Much less can their appearance in different countries be said to indicate contemporaneity. The dolmens of Africa are often found to contain objects peculiar to the Iron Age, and it is said that in some parts of India the people are still in the habit of erecting dolmens and other megalithic monuments. Scandinavian archaeologists assign their dolmens exclusively to the Stone Age. It would therefore appear as if a subsequent stage of degradation occurred, when a tamer style of interment ensued, and the Bronze Age barrows replaced the dolmens, and these again gave way to the Iron Age burials—the ship-barrows and large tumuli of the vikings, as manifested in the three tumuli of Thor, Odin, and Freya at

RUDOLPH I. (1218–1291), German king, eldest son of Albert IV., count of Hapsburg, was born on the 1st May 1218. By marriage and in other ways he greatly extended his hereditary dominions, so that when he became king he was lord not only of Hapsburg but of the counties of Kyburg and Lenzburg and of the landgraviate of Alsace. At different times he carried on war with the bishop of Strasburg, the abbot of St Gall, and the city of Basel. He was engaged in his second struggle with Basel in 1273 when Frederick, burgrave of Nuremberg, brought the intelligence that he had been elected to the German crown. Basel at once submitted, and Rudolph went to Aix-la-Chapelle, where he was crowned on the 28th October 1273. The princes had become so independent during the Great Interregnum that they would have preferred to have no supreme ruler; but Pope Gregory X. had threatened that if they did not elect a king he would himself appoint one. The pope now cordially supported Rudolph, who proved to be much more energetic than the electors had anticipated. Having secured the friendship of the palgrave Louis and Duke Albert of Saxony by allowing them to marry his daughters, he advanced against Ottocar, king of Bohemia, and Henry, duke of Bavaria, both of whom had refused to do him homage. Henry was soon won over to the new king's side, and then Ottocar had to sue for peace. His request was granted only on condition that he should cede Austria, Styria, Carinthia, and Carniola. By and by Ottocar again rebelled, and was slain in 1278 in a battle fought on the Marchfeld. Rudolph gave Bohemia and Moravia to Wenceslaus, Ottocar's son; but Austria, Styria, and Carniola he granted to his own sons, Albert and Rudolph. Carinthia was given to Meinhard, count of Tyrol, who agreed that if his descendants in the male line died out the land should pass to Rudolph's family. Rudolph compelled Otho, count of Upper Burgundy, and other nobles, who tried to make themselves independent of the German crown, to acknowledge his supremacy; and he recovered certain fiefs in what is now Switzerland, which had been seized by the count of Savoy. He also restored peace in Bohemia, and gave his daughter in marriage to the young king, Wenceslaus. He often visited troubled parts of the kingdom, settling local disputes, and destroying the towers of robber barons. On the whole, his rule was a beneficent one, but he did not succeed in re-establishing the authority of the crown, nor did he see how great an element of strength he might have found in an alliance with the cities. The electors he was forced to confirm in the possession of important rights, which were maintained under his successors. His reign is memorable chiefly because he was the founder of the greatness of the house of Hapsburg. In 1281 his first wife died, and in 1284 he married Elizabeth, daughter of Hugo IV., duke of Burgundy. He died at Gernersheim on the 15th July 1291.

See Lorenz, *Deutsche Geschichte im 13 und 14 Jahrh.* (1867); Huber, *Rudolf vor seiner Thronbesteigung* (in the *Almanach der kaiserlichen Akademie*, 1873); Hirn, *Rudolf von Habsburg* (1874).

RUDOLPH II. (1552–1612), Holy Roman emperor, was the son of the emperor Maximilian II., and was born on the 18th July 1552. In 1572 he obtained the crown of Hungary, in 1575 that of Bohemia, with the title "King of the Romans"; and in 1576, after his father's death, he became emperor. He was of an indolent and melancholy disposition, and preferred the study of astrology and alchemy to the responsibilities of government. He

surrendered himself absolutely to the control of the Jesuits, under whose influence he had been brought up at the gloomy court of Spain; and in his hereditary lands they laboured assiduously to destroy Protestantism. The Protestants were deprived of the right of public worship in Vienna and other towns; their schools were closed, and many of their preachers banished. Almost all public offices, too, were placed in the hands of Roman Catholics. In the lands which Rudolph ruled, not by hereditary right, but as emperor, his advisers could exercise less authority; but there also they did what they could to foster the Catholic reaction. In 1607 Maximilian, duke of Bavaria, was allowed to seize the imperial city Donauwörth, the Protestant inhabitants of which had quarrelled with the abbot. This and other high-handed proceedings alarmed the Protestants of Germany, and in 1608, under the leadership of Frederick IV., elector of the Palatinate, they formed a confederation called the Union for the protection of their interests. The Catholic princes, guided by Duke Maximilian of Bavaria, responded by forming the League. Civil war seemed inevitable, but it was postponed by the murder of Henry IV. of France, who had promised to support the Union, and by the death of the elector Frederick IV. Meanwhile, the greatest confusion prevailed in Hungary, due in part to religious oppression, in part to a war with the Turks. In 1604 the Hungarians rebelled, and peace was not restored until 1606, when Matthias, the emperor's brother, with the sanction of his younger brothers, who acknowledged him as head of the family, came to terms both with the Hungarians and with the sultan. Matthias allied himself with the Protestants, and compelled Rudolph to give up to him Hungary, Moravia, and the greater part of Austria. The emperor then tried to strengthen his position by granting to the nobles, knights, and towns of Bohemia perfect religious freedom, with the right to build Protestant churches and schools on their own and on the royal lands. Even after they had obtained the letter of majesty in which these concessions were embodied, the Bohemians did not trust Rudolph; and, when at his request the archduke Leopold appeared in their country with an army, they invited Matthias to come to their aid. Matthias went, and the emperor had no alternative but to resign to him in 1611 the remainder of his hereditary territories. Rudolph died on the 20th January 1612.

See Kurz, *Geschichte Oesterreichs unter Kaiser Rudolf* (1821); Gindely, *Rudolf II. und seine Zeit* (1863–65).

RUDOLSTADT, capital of the German principality of Schwarzburg-Rudolstadt, and chief residence of the prince, is situated on the left bank of the Saale, 18 miles due south of Weimar, in one of the most beautiful districts of Thuringia. The picturesque little town is a favourite summer watering-place, with pine baths, as well as a frequented tourist resort. Besides containing the Government buildings of the little principality, Rudolstadt is fairly well provided with schools and other institutions, including a library of 60,000 volumes. The residence of the prince is in the Heidecksburg, a palace on an eminence 200 feet above the Saale, rebuilt after a fire in 1735, and containing various show apartments. The Ludwigsburg, another palace within the town built in 1742, accommodates the natural history collections belonging to the prince. The principal church dates from the end of the 15th century. In the Anger, a tree-shaded public park between the town and the river, is the theatre. Various memorials in and near the town commemorate the visits of Schiller to the neighbourhood in 1787 and 1788. The industries of the district include the manufacture of porcelain and of dyestuffs, wool-spinning, and bell-founding. The population (4100 in 1817) was 8747 in 1880.

The name of Rudolstadt occurs in an inventory of the possessions of the abbey of Hersfeld in the year 800. After passing through the possession of the German emperor and of the rulers of Orlamünde and Weimar, it came into the hands of the dukes of Schwarzburg in 1355. Its town rights were confirmed in 1404; and since 1599 it has been the residence of the ruling house.

RUEDA, LOPE DE. See DRAMA, vol. vii. p. 420.

RUFF, a bird so called from the very beautiful and remarkable frill of elongated feathers that, just before the breeding-season, grow thickly round the neck of the male, who is considerably larger than the female, known as the Reeve. In many respects this species, the *Tringa pugnax* of Linnæus and the *Machetes pugnax* of the majority of modern ornithologists, is one of the most singular in existence, and yet its singularities have been very ill appreciated by zoological writers in general.¹ These singularities would require almost a volume to

Ruff.

describe properly. The best account of them is unquestionably that given in 1813 by Montagu (*Suppl. Orn. Dictionary*), who seems to have been particularly struck by the extraordinary peculiarities of the species, and, to investigate them, expressly visited the fens of Lincolnshire, possibly excited thereto by the example of Pennant, whose information, personally collected there in 1769, was of a kind to provoke further inquiry, while Daniel (*Rural Sports*, iii. p. 234) had added some other particulars, and subsequently Graves in 1816 repeated in the same district the experience of his predecessors. Since that time the great changes produced by the drainage of the fen-country have banished this species from nearly the whole of it, so that Lubbock (*Obs. Fauna of Norfolk*, pp. 68-73) and Mr Stevenson (*Birds of Norfolk*, ii. pp. 261-271) can alone be cited as modern witnesses of its habits in England,

¹ Mr Darwin, though frequently citing (*Descent of Man and Sexual Selection*, i. pp. 270, 306; ii. pp. 41, 42, 48, 81, 84, 100, 111) the Ruff as a witness in various capacities, most unfortunately seems never to have had its peculiarities presented to him in such a form that he could fully perceive their bearings. However, the significance of the lesson that the Ruff may teach was hardly conceivable before he began to write; but the fact is not the less to be regretted that he never elucidated its importance, not only in regard to "Sexual Selection," but more especially with respect to "Polymorphism." He appears not to have consulted Montagu's original account of this bird, and seems to have known it only by the excerpt given by Macgillivray, in which were not included the important passages on the extreme diversity of plumage exhibited by the males—that author passing over this wonderful peculiarity in a paragraph of less than a score of lines.

while the trade of netting or snaring Ruffs, and fattening them for the table has for many years practically ceased.

The cock-bird, when out of his nuptial attire, or, to use the fenman's expression, when he has not "his show on," and the hen at all seasons, offer no very remarkable deviation from ordinary Sandpipers, and outwardly² there is nothing, except the unequal size of the two sexes, to rouse suspicion of any abnormal peculiarity. But when spring comes all is changed. In a surprisingly short time the feathers clothing the face of the male are shed, and their place is taken by *papillæ* or small caruncles of bright yellow or pale pink. From each side of his head sprouts a tuft of stiff curled feathers, giving the appearance of long ears, while the feathers of the throat change colour, and beneath and around it sprouts the frill or ruff already mentioned as giving the bird his name. The feathers which form this remarkable adornment, quite unique among birds, are, like those of the "ear-tufts," stiff and incurved at the end, but much longer—measuring more than two inches. They are closely arrayed, capable of depression or elevation, and form a shield to the front of the breast impenetrable by the bill of a rival.³ More extraordinary than this, from one point of view, is the great variety of coloration that obtains in these temporary outgrowths. It has often been said that no one ever saw two Ruffs alike. That is perhaps an over-statement; but, considering the really few colours that the birds exhibit, the variation is something marvellous, so that fifty examples or more may be compared without finding a very close resemblance between any two of them, while the individual variation is increased by the "ear-tufts," which generally differ in colour from the frill, and thus produce a combination of diversity. The colours range from deep black to pure white, passing through chestnut or bay, and many tints of brown or ashy-grey, while often the feathers are more or less closely barred with some darker shade, and the black is very frequently glossed with violet, blue, or green—or, in addition, spangled with white, grey, or gold-colour. The white, on the other hand, is not rarely freckled, streaked, or barred with grey, rufous-brown, or black. In some examples the barring is most regularly concentric, in others more or less broken-up or undulating, and the latter may be said of the streaks. It was ascertained by Montagu, and has since been confirmed by the still wider experience and if possible more carefully conducted observation of Mr Bartlett, that every Ruff in each successive year assumes tufts and frill exactly the same in colour and markings as those he wore in the preceding season; and thus, polymorphic as is the male as a species, as an individual he is unchangeable in his wedding-garment—a lesson that might possibly be applied to many other birds. The white frill is said to be the rarest.

That all this wonderful "show" is the consequence of the polygamous habit of the Ruff can scarcely be doubted. No other species of Limicoline bird has, so far as is known, any tendency to it. Indeed, in many species of *Limicolæ*, as the Dotterel, the Godwits (vol. x. p. 720), Phalaropes, and perhaps some others, the female is larger and more brightly coloured than the male, who in such cases seems to take upon himself some at least of the domestic duties. Both Montagu and Graves, to say nothing of other writers, state that the Ruffs, in England, were far more numerous than the Reeves; and their testimony can hardly be doubted; though in Germany Naumann (*Vög. Deutschlands*, vii. p.

² Internally there is a great difference in the form of the posterior margin of the sternum, as long ago remarked by Nitzsch.

³ This "ruff" has been compared to that of Elizabethan or Jacobean costume, but it is essentially different, since that was open in front and widest and most projecting behind, whereas the bird's decorative apparel is most developed in front and at the sides and scarcely exists behind.

544) considers that this is only the case in the earlier part of the season, and that later the females greatly outnumber the males. It remains to say that the moral characteristics of the Ruff exceed even anything that might be inferred from what has been already stated. By no one have they been more happily described than by Wolley, in a communication to Hewitson (*Eggs of Brit. Birds*, 3d ed., p. 346), as follows:—

“The Ruff, like other fine gentlemen, takes much more trouble with his courtship than with his duties as a husband. Whilst the Reeves are sitting on their eggs, scattered about the swamps, he is to be seen far away flitting about in flocks, and on the ground dancing and sparring with his companions. Before they are confined to their nests, it is wonderful with what devotion the females are attended by their gay followers, who seem to be each trying to be more attentive than the rest. Nothing can be more expressive of humility and ardent love than some of the actions of the Ruff. He throws himself prostrate on the ground, with every feather on his body standing up and quivering; but he seems as if he were afraid of coming too near his mistress. If she flies off, he starts up in an instant to arrive before her at the next place of alighting, and all his actions are full of life and spirit. But none of his spirit is expended in care for his family. He never comes to see after an enemy. In the [Lapland] marshes, a Reeve now and then flies near with a scarcely audible *ka-ka-kuik*; but she seems a dull bird, and makes no noisy attack on an invader.”

Want of space forbids a fuller account of this extremely interesting species. Its breeding-grounds extend from Great Britain¹ across northern Europe and Asia; but the birds become less numerous towards the east. They winter in India, reaching even Ceylon, and Africa as far as the Cape of Good Hope. The Ruff also occasionally visits Iceland, and there are several well-authenticated records of its occurrence on the eastern coast of the United States, while an example is stated (*Ibis*, 1875, p. 332) to have been received from the northern part of South America. (A. N.)

RUFINUS, TYRANNIUS (TURRANIUS, TORANUS), the well-known contemporary of Jerome, was born at or near Aquileia about the year 345. In early life he studied rhetoric, and while still comparatively young he entered the cloister as a catechumen, receiving baptism about 370. About the same time a casual visit of Jerome to Aquileia led to the formation of a close and intimate friendship between the two students, and shortly after Jerome's departure for the East Rufinus also was drawn thither (in 372 or 373) by his interest in its theology and monasticism. He first settled in Egypt, hearing the lectures of Didymus, the Origenistic teacher at Alexandria, and also cultivating friendly relations with Macarius and other ascetics in the desert. In Egypt, if not even before leaving Italy, he had become intimately acquainted with Melania, a wealthy and devout Roman matron, who since the death of her husband had devoted all her means to religious and charitable works; and when she removed to Palestine, taking with her a number of clergy and monks on whom the persecutions of Valens had borne heavily, Rufinus ultimately (about 378) followed her. While his patroness lived in a convent of her own in Jerusalem, Rufinus, in close co-operation with her and at her expense, gathered together a number of monks in a monastery on the Mount of Olives, devoting himself at the same time with much ardour to the study of Greek theology. When Jerome came to reside at Bethlehem in 386 the friendship formed at Aquileia was renewed. Another of the intimates of Rufinus was John, bishop of Jerusalem, and formerly a Nitrian monk, by whom he was ordained to the priesthood in 390. In 394, in consequence of the attack upon the doctrines of Origen made by Epiphanius of Salamis during a visit to Jerusalem, a fierce quarrel broke out, which found Rufinus and Jerome ranged on different sides; and, though three

years afterwards a formal reconciliation was brought about between Jerome and John through the intervention of third parties, the breach between Jerome and Rufinus remained unhealed.

In the autumn of 397 Rufinus embarked for Rome, where, finding that the theological controversies of the East were exciting much interest and curiosity, he published a Latin translation of the *Apology* of Pamphilus for Origen, and also (398–399) a somewhat free rendering of the *περὶ ἀρχῶν* of that author himself. In the preface to the latter work he had referred to Jerome as an admirer of Origen, and as having already translated some of his works; this allusion proved very annoying to the subject of it, who was now exceedingly sensitive as to his reputation for orthodoxy, and the consequence was a bitter pamphlet war, very wonderful to the modern onlooker, who finds it difficult to see anything discreditable in the accusation against a Biblical scholar that he had once thought well of Origen, or in the countercharge against a translator that he had avowedly exercised editorial functions as well. Some time during the pontificate of Anastasius (398–402) Rufinus was summoned from Aquileia to Rome to vindicate his orthodoxy, but he excused himself from personal attendance in a written *Apologia pro fide sua*; the pope in his reply expressly condemned Origen, but leniently left the question of Rufinus's orthodoxy to his own conscience. In 408 we find Rufinus at the monastery of Pinetum (in the Campagna?); thence he was driven by the arrival of Alaric to Sicily, being accompanied by Melania in his flight. In Sicily he was engaged in translating the *Homilies* of Origen when he died in 410.

The original works of Rufinus are—(1) *De Adulteratione Librorum Origenis*—an appendix to his translation of the *Apology* of Pamphilus, and intended to show that many of the features in Origen's teaching which were then held to be objectionable arise from interpolations and falsifications of the genuine text; (2) *De Benedictionibus XII Patriarcharum Libri II*,—an exposition of Gen. xlix.; (3) *Apologia s. Invektivarum in Hieronymum Libri II*; (4) *Apologia pro Fide Sua ad Anastasium Pontificem*; (5) *Historia Eremitica*—consisting of the lives of thirty-three monks of the Nitrian desert; (6) *Expositio Symboli*. The *Historiæ Ecclesiasticæ Libri XI* of Rufinus consist partly of a free translation of Eusebius (10 books in 9) and partly of a continuation (bks. x. and xi.) down to the time of Theodosius the Great. The other translations of Rufinus are—(1) the *Instituta Monachorum* and some of the *Homilies* of Basil; (2) the *Apology* of Pamphilus, referred to above; (3) Origen's *Principia*; (4) Origen's *Homilies* (Gen.—Kings, also Cant. and Rom.); (5) *Opuscula* of Gregory of Nazianzus; (6) the *Sententiæ* of Sixtus, an unknown Greek philosopher; (7) the *Sententiæ* of Evagrius; (8) the *Clementine Recognitions* (the only form in which that work is now extant); (9) the *Canon Paschalis* of Anatolius Alexandrinus.

Vallarsi's uncompleted edition of Rufinus (vol. i., fol., Verona, 1745) contains the *De Benedictionibus*, the *Apologies*, the *Expositio Symboli*, the *Historia Eremitica*, and the two original books of the *Hist. Eccl.* See also Migne, *Patrol.* (vol. xxi. of the Latin series). For the translations, see the various editions of Origen, Eusebius, &c.

RUGBY, a market-town of Warwickshire, is finely situated on a table-land rising from the southern bank of the Avon, at the junction of several railway lines, and near the Grand Junction Canal, 30 miles E.S.E. of Birmingham, and 20 S.S.W. of Leicester. It is a well-built town, with a large number of modern houses erected for private residences. It occupies a gravel site, is well drained, and has a good supply of water. It owes its importance to the grammar school, built and endowed by Laurence Sheriff, a merchant grocer and servant to Queen Elizabeth, and a native of the neighbouring village of Brownsover. The endowment consisted of the parsonage of Brownsover, Sheriff's mansion house in Rugby, and one-third (8 acres) of his estate in Middlesex, near the Foundling Hospital, London, which, being let on building leases, gradually increased to about £5000 a year. The full endowment was obtained in 1653. The school originally stood opposite the parish church, and was removed to its

¹ In England of late years it has been known to breed only in one locality, the name or situation of which it is not desirable to publish.

present site on the south side of the town between 1740 and 1750. In 1809 it was rebuilt from designs by Hake-will; the chapel, dedicated to St Lawrence, was added in 1820. At the tercentenary of the school in 1867 subscriptions were set on foot for founding scholarships, building additional schoolrooms, rebuilding or enlarging the chapel, and other objects. The chapel was rebuilt and reconsecrated in 1872. A swimming bath was erected in 1876; the Temple observatory, containing a fine equatorial refractor by Alvan Clark, was built in 1877, and the Temple reading room with the art museum in 1878. The workshops underneath the gymnasium were opened in 1880, and a new big school and class rooms were erected in 1885. There are three major and four minor exhibitions for students to any university in the United Kingdom. From about 70 in 1777 the numbers attending the school have increased to over 400. A great impulse was given to the progress of the school during the headmastership of Dr Arnold, 1827-1842. The best known of Arnold's successors are Tait, afterwards archbishop of Canterbury, and Temple, the present bishop of London. The parish church of St Andrew's is, with the exception of the tower and the north arcade in the nave, entirely modern, having been built from designs by Mr Butterfield at a cost of £22,000, and reconsecrated in 1879. The daughter church of the Holy Trinity, a handsome building by Sir Gilbert Scott, in close proximity to St Andrew's, was erected in 1853. St Marie's Catholic Church is in the Early English style. A town-hall was erected in 1858, at a cost of £7000. There are a number of charities, including Laurence Sheriff's almshouses (founded 1567), Elborow's almshouses (1707), Miss Butlin's almshouses (1851), and the hospital of St Cross, opened in 1884, at a cost of £20,000. A public recreation ground was provided by the local government board in 1877. The town has an important cattle market. The population of the urban sanitary district (area 1617 acres) in 1871 was 8385, and in 1881 it was 9891.

Rugby was originally a hamlet of the adjoining parish of Clifton-on-Dunsmore, and is separately treated of as such in Domesday Book. Ernaldus de Bosco (Ernald de Bois), lord of the manor of Clifton, seems to have erected the first chapel in Rugby, in the reign of Stephen, about 1140. It was afterwards granted by him, with certain lands, to endow the abbey of St Mary, Leicester, which grant was confirmed by his successors and by royal charter of Henry II. In the second year of King John (1200) a suit took place between Henry de Rokeby, lord of the manor of Rugby, and Paul, abbot of St Mary, Leicester, which resulted in the former obtaining possession of the advowson of Rugby, on condition of homage and service to the abbot of Leicester. By virtue of this agreement the chapel was converted into a parish church, and the vicarage into a rectory. In 1850 Ralph, Lord Stafford, became possessed of the manor and advowson of Rugby, and considerably enlarged the parish church. Subsequent alterations, notably in 1814 and 1831, left little of this structure remaining except the tower and north arcade in the nave. The advowson of Rugby is now the property of the earl of Craven; and the late rector was widely known and honoured as "the poet pastor," John Moultrie.

RUGE, ARNOLD (1803-1880), German philosophical and political writer, was born at Bergen, in the island of Rügen, on the 13th September 1803. He studied at Halle, Jena, and Heidelberg, and became an enthusiastic adherent of the party which sought to create a free and united Germany. For his zeal in this cause he had to spend five years in the fortress of Kolberg, where he devoted himself to the study of classical writers, especially Plato and the Greek poets. On his release in 1830, he published *Schill und die Seinen*, a tragedy, and a translation of *Ædipus in Colonos*. Ruge settled in Halle, where in 1838, in association with his friend Echtermayer, he founded the *Hallesche Jahrbücher für deutsche Kunst und Wissenschaft*. In this periodical, which soon took a very high place, he discussed all the great questions which were then agitating the best minds in Europe, dealing

with them from the point of view of the Hegelian philosophy, interpreted in the most liberal sense. The *Jahrbücher* was detested by the orthodox party in Prussia; but, as it was published in Leipsic, the editors fancied that it was beyond the reach of the Prussian Government. In 1840, however, soon after the accession of King Frederick William IV., they were ordered, on account of the name of the periodical, to have it printed in Halle, subject to the censorship there. Thereupon Ruge went to Dresden, and the *Jahrbücher* (with which Echtermayer was no longer connected) continued to appear in Leipsic, but with the title *Deutsche Jahrbücher*, and without the names of the editors. It now became more liberal than ever, and in 1843 was suppressed by the Saxon Government. In Paris Ruge tried to act with Karl Marx as co-editor of the *Deutsch-Französische Jahrbücher*, but the two friends soon parted, Ruge having little sympathy with Marx's socialist theories. Ruge next associated himself with a publishing firm in Zürich, and when it was put down he attempted to establish a firm of his own in Leipsic, but his scheme was thwarted by the Saxon Government. In the revolutionary movement of 1848 Ruge played a prominent part. He organized the Extreme Left in the Frankfort parliament, and for some time he lived in Berlin as the editor of the *Reform*, in which he advocated the opinions of the Left in the Prussian National Assembly. The career of the *Reform* being cut short by the Prussian Government, Ruge soon afterwards visited Paris, hoping to establish, through his friend Ledru-Rollin, some relations between German and French republicans; but in 1849 both Ledru-Rollin and Ruge had to take refuge in London. Here, in company with Mazzini and other advanced politicians, they formed a "European Democratic Committee." From this committee Ruge soon withdrew, and in 1850 he went to Brighton, where he supported himself by working both as a teacher in schools and as a writer. He took a passionate interest in the events of 1866 and 1870, and as a publicist vigorously supported the cause of Prussia against Austria, and that of Germany against France. In his last years he received from the German Government a pension of 3000 marks. He died on the 31st December 1880.

Ruge was a man of generous sympathies and an able writer, but he did not produce any work of enduring importance. In 1846-48 his *Gesammelte Schriften* were published in ten volumes. After this time he wrote, among other books, *Unser System*, *Revolutionsnovellen*, *Die Loge des Humanismus*, and *Aus früherer Zeit* (his memoirs). He also wrote many poems, and several dramas and romances, and translated into German various English works, including the *Letters of Junius* and Buckle's *History of Civilization*.

RÜGEN, the largest island belonging to Germany, is situated in the Baltic Sea, immediately opposite the town of Stralsund, $1\frac{1}{2}$ miles off the north-west coast of Pomerania in Prussia, from which it is separated by the narrow Strelasund. Its shape is exceedingly irregular, and its coast-line is broken by very numerous bays and peninsulas, sometimes of considerable size. The general name is applied by the natives only to the roughly triangular main trunk of the island, while the larger peninsulas, the landward extremities of which taper to very narrow necks of land, are considered to be as distinct from Rügen as the various adjacent smaller islands which are also statistically included under the name. The chief peninsulas are those of Jasmund and Wittow on the north, and Mönchgut, at one time the property of the monastery of Eldena, on the south-east; and the chief neighbouring islands are Unmanz and Hiddensee, both off the north-west coast. The greatest length of Rügen from north to south is 32 miles; its greatest breadth is $25\frac{1}{2}$ miles; and its area is 377 square miles. The surface gradually rises towards the west to Rugard (335 feet), the "eye of

Rügen," near Bergen, but the highest point is the Herthaburg (505 feet) in Jasmund. Erratic blocks are scattered throughout the island, and the roads are made with granite. Though much of Rügen is flat and sandy, the fine beech-woods which cover great part of it and the northern coast scenery combine with the convenient sea-bathing offered by the various villages round the coast to attract large numbers of visitors annually. The most beautiful and attractive part of the island is the peninsula of Jasmund, which terminates to the north in the Stubenkammer (from two Slavonic words meaning "rock steps"), a sheer chalk cliff by the sea, the summit of which, known as the Königsstuhl, is 420 feet above sea-level. The east of Jasmund is clothed with an extensive beech-wood called the Stubbenitz, in which lies the Burg or Hertha Lake. Connected with Jasmund only by the narrow isthmus of Schabe to the west is the peninsula of Wittow, the most fertile part of the island. At its north-west extremity rises the height of Arcona, with a lighthouse.

The official capital of the island is Bergen (3662 inhabitants), connected since 1883 with Stralsund by a railway and ferry. The other chief places are Garz (2014), Sagard (1447), Gingst (1285), and Putbus (1752). The last is the old capital of a barony of the princes of Putbus. Sassnitz, Göhren, and Putbus are among the favourite bathing resorts. Schoritz was the birthplace of the patriot and poet, Arndt (1769-1860). Ecclesiastically, Rügen is divided into 27 parishes, in which the pastoral succession is said to be almost hereditary. The inhabitants are distinguished from those of the mainland by peculiarities of dialect, costume, and habits; and even the various peninsulas differ from each other in these particulars. The peninsula of Mönchgut has best preserved its peculiarities; but there too primitive simplicity is yielding to the influence of the annual stream of summer visitors. The inhabitants rear some cattle, and Rügen has long been famous for its geese; but the only really considerable industry is fishing,—the herring-fishery being especially important. Rügen, with the neighbouring islands, forms a governmental department, with a population (1880) of 46,115.

The original Germanic inhabitants of Rügen were dispossessed by Slavs; and there are still various relics of the long reign of paganism that ensued. In the Stubbenitz and elsewhere Huns' or giants' graves (see p. 52, *supra*) are common; and near the Hertha Lake are the ruins of an ancient edifice which some have sought (though perhaps erroneously) to identify with the shrine of the heathen deity Hertha or Nerthus, referred to by Tacitus. On Arcona in Wittow are the remains of an ancient fortress, enclosing a temple of the four-headed god Svantevit, which was destroyed in 1168 by the Danish king Waldemar I., when he made himself master of the island. From that date until 1325 Rügen was ruled by a succession of native princes, at first under Danish supremacy; and, after being for a century and a half the possession of a branch of the ruling family in Pomerania, it was finally united with that province in 1478, and passed with it into the possession of Sweden in 1648. With the rest of Western Pomerania Rügen has belonged to Prussia since 1815.

RUHNKEN, DAVID (1723-1798), one of the most illustrious scholars of the Netherlands, was of German origin, having been born in Pomerania in 1723. His parents had him educated for the church, but after a residence of two years at the university of Wittenberg, he determined to live the life of a scholar. His biographer (Wytttenbach) somewhat quaintly exhorts all studious youths who feel the inner call as Ruhnken did to show the same boldness in crossing the wishes of their parents. At Wittenberg, Ruhnken lived in close intimacy with the two most distinguished professors, Ritter and Berger, who fired his passion for things ancient, and guided his studies. To them he owed a thorough grounding in ancient history and Roman antiquities and literature; and from them he learned what distinguished him among the scholars of his

time, a pure and at the same time a vivid Latin style. At Wittenberg, too, Ruhnken derived valuable mental training from study in mathematics and Roman law. Probably nothing would have severed him from his surroundings there but a desire which daily grew upon him to explore the inmost recesses of Greek literature. Neither at Wittenberg nor at any other German university was Greek in that age seriously studied. It was taught in the main to students in divinity for the sake of the Greek Testament and the early fathers of the church,—taught as a necessary appendage to Hebrew and Syriac, and generally by the same professors. F. A. Wolf is the real creator of Greek scholarship in modern Germany, and Porson's gibe that "the Germans in Greek are sadly to seek" was barbed with truth. It is significant of the state of Hellenic studies in Germany in 1743 that their leading exponents were Gesner and Ernesti. Ruhnken was well advised by his friends at Wittenberg to seek the university of Leyden, where, stimulated by the influence of Bentley, the great scholar Tiberius Hemsterhuis had founded the only real school of Greek learning which had existed on the Continent since the days of Joseph Scaliger and Isaac Casaubon.

Perhaps no two men of letters ever lived in closer friendship than Hemsterhuis and Ruhnken during the twenty-three years which passed from Ruhnken's arrival in the Netherlands in 1743 to the death of Hemsterhuis in 1766. A few years made it clear that Ruhnken and Valckenaer were the two pupils of the great master on whom his inheritance must devolve. As his reputation spread, many efforts were made to attract Ruhnken back to Germany, but the air of freedom which he drew in the Netherlands was more to him than all the flesh-pots his native land could offer. Indeed, after settling in Leyden, he only left the country once, when he spent a year in Paris, ransacking the public libraries (1755). For work achieved, this year of Ruhnken may compare even with the famous year which Ritschl spent in Italy. In 1757 Ruhnken was appointed lecturer in Greek, to assist Hemsterhuis, and in 1761 he succeeded Oudendorp, with the title of "ordinary professor of history and eloquence," but practically as Latin professor. This promotion drew on him the enmity of some native Netherlanders, who deemed themselves (not without some show of reason) to possess stronger claims for a chair of Latin. The only defence made by Ruhnken was to publish works on Latin literature which eclipsed and silenced his rivals. In 1766 Valckenaer succeeded Hemsterhuis in the Greek chair. The intimacy between the two colleagues was only broken by Valckenaer's death in 1785, and stood without strain the test of common candidature for the office (an important one at Leyden) of university librarian, in which Ruhnken was successful. Ruhnken's later years were clouded by severe domestic misfortune, and by the political commotions which, after the outbreak of the war with England in 1780, troubled the Netherlands without ceasing, and threatened to extinguish the university of Leyden. The year of Ruhnken's death was 1798.

Personally, he was as far as possible removed from being a recluse or a pedant. He had a well-knit and even handsome frame, attractive manners (though sometimes tinged with irony), and a nature simple and healthy, and open to impressions from all sides. Fond of society, he cared little to what rank his associates belonged, if they were genuine men in whom he might find something to learn. His biographer even says of him in his early days that he knew how to sacrifice to the Sirens without proving traitor to the Muses. Life in the open air had a great attraction for him; he was fond of sport, and would sometimes devote to it two or three days in the week. In

his bearing towards other scholars Ruhnken was generous and dignified, distributing literary aid with a free hand, and meeting onslaughts for the most part with a smile. It would be difficult to point out in the history of scholarship the name of another man who so thoroughly possessed the *savoir vivre*.

In the records of learning Ruhnken occupies an important position. He forms a principal link in the chain which connects Bentley with the modern scholarship of the Continent. The spirit and the aims of Hemsterhuis, the great reviver of Continental learning, were committed to his trust, and were faithfully maintained. He greatly widened the circle of those who valued taste and precision in classical scholarship. He powerfully aided the emancipation of Greek studies from theology; nor must it be forgotten that he first in modern times dared to think of rescuing Plato from the hands of the professed philosophers—men presumptuous enough to interpret the ancient sage with little or no knowledge of the language in which he wrote.

Ruhnken's principal works are editions of (1) Timæus's *Lexicon of Platonic Words*, (2) Thaleleus and other Greek commentators on Roman law, (3) Rutilius Lupus and other grammarians, (4) Velleius Paterculus, (5) the works of Muretus. He also occupied himself much with the history of Greek literature, particularly the oratorical literature, with the Homeric hymns, the scholia on Plato, and the Greek and Roman grammarians and rhetoricians. A discovery famous in its time was that in the text of the work of Apsines on rhetoric a large piece of a work by Longinus was embedded. Recent views of the writings attributed to Longinus have lessened the interest of this discovery without lessening its merit. The biography of Ruhnken was written by his great pupil Wytenbach, soon after his death. (J. S. R.)

RUHRORT, a busy trading town in Prussia, is situated at the junction of the Ruhr and Rhine, in the midst of a productive coal district, 15 miles north of Düsseldorf. Ruhrort has the largest river harbour in Germany, with very extensive quays; and most of the 1½ million tons of coal which are annually exported from the neighbourhood are despatched in the fleet of steam-tugs and barges which belong to the port. About one half of the coal goes to Holland, and the rest to towns on the upper Rhine. Grain and timber are also exported. In 1881 11,282 craft, carrying 1,791,213 tons, left the harbour. The goods traffic between Ruhrort and Homberg on the opposite bank of the Rhine is carried on by large steam ferry boats, in which the railway waggons are placed with the help of towers, 128 feet high, on each side of the river. The industries of the town include active shipbuilding, iron and tin working, and the making of cordage and machinery. The inhabitants numbered 1443 in 1816, and 9130 in 1880. Ruhrort formerly belonged to Cleves; it received town rights in 1587.

RULHIÈRE, or RULHIÈRES, CLAUDE CARLOMAN DE (1735–1791), poet and historian, was born at Bondy in 1735, and died at Paris in 1791. He was for a time a soldier, and served under Richelieu in Germany. But at twenty-five he accompanied Breteuil to St Petersburg as secretary of legation. Here he actually saw the revolution which seated Catherine II. on the throne, and thus obtained the facts of his best-known and best work, the short sketch called *Anecdotes sur la Revolution de Russie en 1762*. It was not published till after the empress's death. The later years of Rulhière's life were spent either in Paris, where he held an appointment in the foreign office and went much into society, or else in travelling over Germany and Poland. The distracted affairs of this latter country gave him the subject of his longest work, *Histoire de l'Anarchie de Pologne* (1807), which was never finished, and which the patriotism of its latest editor, M. Ostrowski, has rather unjustifiably rebaptized *Révolutions de Pologne*. Rulhière was made an Academician in 1787.

Besides the historical works mentioned, he wrote one on the Revocation of the Edict of Nantes (1788).

Rulhière as an historian has much merit of style and arrangement, and the short sketch of the Russian revolution is justly ranked among the masterpieces of the kind in French. Of the larger *Poland* Carlyle, as justly, complains that its allowance of fact is too small in proportion to its bulk. The author was also a fertile writer of *vers de société*, short satires, epigrams, &c., which show much point and polish, and he had a considerable reputation among the witty and ill-natured group also containing Chamfort, Rivarol, Champcenetz, &c. On the other hand he has the credit of being long and disinterestedly assiduous in caring for J. J. Rousseau in his morose old age, until Rousseau as usual quarrelled with him.

Rulhière's works were published by Anguis in 1819 (Paris, 6 vols. 8vo). The *Russian Revolution* may be found in the *Chefs-d'œuvre Historiques* of the Collection Didot, and the *Poland*, with title altered as above, in the same Collection.

RUM is a spirituous liquor, prepared from molasses, skimmings of the boiling house, and other saccharine by-products, and the refuse juice of the cane-sugar manufacture. Its distillation, which is a simple process, may be conducted in connexion with any cane-sugar establishment, but the rum which comes to the American and European markets is chiefly the produce of the West India Islands and Guiana. The ordinary method of working in the West Indies is the following. A wash is prepared consisting of sugar skimmings 4 parts, lees of still or dunder 5 parts, and molasses 1 part, the quantity prepared being equal to the capacity of the still in use. Dunder consists of the residue of the still from previous distillations, and it takes the place of a ferment, besides which the acetic acid it contains, derived from the fermenting wash of previous operations, has a favourable influence on the progress of attenuation. The wash prepared as above is placed in the fermenting vat, where, according to weather and other conditions, the fermentation proceeds more or less briskly; but usually a week or ten days is the period required for attenuation, during which time the scum formed is removed from the surface of the vat twice daily. When sufficiently attenuated, the wash is run into the still, which is generally of a simple construction, and distilled off, the first product being "low wines," which on redistillation come over as "high wines" or strong rum. When a Pontefex still is used, which contains two intermediate "retorts" between the still and the worm, a strong spirit is obtained at the first distillation. The charge of wash yields from 10 to 12 per cent. of rum, of an average strength of 25° over proof. Pure distilled rum is an entirely colourless liquid, but as imported and sold it generally has a deep brown colour imparted by caramel or by storage in sherry casks. It has a peculiar aroma, derived principally from the presence of a minute proportion of butyric ether. Rum varies very considerably in quality, the finest being known as Jamaica rum, whether it is the product of that island or not. An inferior quality of rum is known among the French as *tafia*; and the lowest quality, into the wash for which debris of sugar cane enters, is called negro rum, and is mostly consumed by the coloured workers in the sugar houses and distilleries. The planters sometimes put rinds and slices of pine-apple into the barrels in which rum is matured, to improve and add to its flavour, and occasionally anise and other flavouring ingredients are also used. The spirit prepared from molasses of beet-sugar factories cannot be classed with rum. The product has a highly disagreeable odour and taste, and it can only be rendered fit for consumption by repeated distillation and concentration to a high degree of strength, whereby the spirit is rendered "silent," or has only a faint rum flavour. In this condition it is used for mixing with strongly flavoured rum, and for the preparation of a fictitious rum, the flavour of which is due to "rum essence,"—a mixture of artificial ether, birch bark oil, and other substances. Cane-sugar molasses enters largely into the materials from which

ARRACK (*q.v.*), the spirit of Java and the Indian Archipelago, is prepared, but its flavour depends more on palm-tree toddy, which also is a constituent of the wash. The imports of rum into the United Kingdom and the home consumption have been decreasing for a number of years.¹

RUMFORD, COUNT. See THOMPSON, SIR BENJAMIN.

RÚMÍ. Mohammed b. Mohammed b. Husáin albalkhí, better known as Mauláná Jalál-uddín Rúmí, the greatest Súfí poet of Persia, was born on the 30th of September 1207 (604 A.H. 6th of Rabí' I.) at Balkh, in Khorásán, where his family had resided from time immemorial, rich in property and public renown. He claimed descent from the caliph Abúbekr, and from the Khwárisim sháh Sultán 'Alá-uddín b. Tukush (1199–1220), whose only daughter, Malika-i-Jahán, had been married to Jalál-uddín's grandfather. Her son, Mohammed, commonly called Bahá-uddín Walad, was a famous doctor of Balkh, who, to escape the jealousy with which the sultan viewed his influence, emigrated to Asia Minor in 1212. Young Jalál-uddín was only five years old at that time, but the signs of his future greatness in spiritual matters began already to manifest themselves in precocious knowledge and in ecstasies and visions. After residing for some time at Malatíyah and afterwards at Erzinján in Armenia, Bahá-uddín was called to Lárindah in Asia Minor, as principal of the local college, and there young Jalál-uddín, who had meanwhile grown under the careful tuition of his father in wisdom and holiness, attained his maturity, and married in 1226 Jauhar Khátún, the daughter of Lálá Sharaf-uddín of Samarkand. Finally, Bahá-uddín was invited to Iconium by 'Alá-uddín Kaikubád (1219–1236), the sultán of Asia Minor, or, as it is commonly called in the East, Rúm,—whence Jalál-uddín's surname (*takhallus*) Rúmí.

After Bahá-uddín's death in 1231, Jalál-uddín went to Aleppo and Damascus for a short time to study, but, as the mere positive sciences in which he had been particularly trained failed to satisfy him, on his return to Iconium, where he became by and by professor of four separate colleges, he took for nine years as his spiritual guide Sayyid Burhán-uddín Husáiní of Tirmidh, one of his father's disciples, and later on the wandering Súfí Shams-uddín of Tabriz, who arrived in Iconium on the 29th of November 1244, and soon acquired the most powerful influence over Jalál-uddín, who even adopted his name as *takhallus* in his ghazals or mystic odes. Shams-uddín's rather aggressive character, however, roused the indignation of the people of Iconium against him, and during a riot in which Jalál-uddín's eldest son, 'Alá-uddín, was killed, he was arrested and probably executed; at least he was no more seen. This fate of his teacher and friend, together with the untimely death of his son, threw Jalál-uddín into deep melancholy, and in remembrance of these victims of popular wrath he founded the order of the Maulawí or (in Turkish pronunciation) Mewlewí dervishes, famous for their piety as well as for their peculiar garb of mourning, their music and their mystic dance (*samá*), which is the outward representation of the circling movement of the spheres, and the inward symbol of the circling movement of the soul caused by the vibrations of

a Súfí's fervent love to God. The establishment of this order, which still possesses numerous cloisters throughout the Turkish empire, and the leadership of which has been kept in Jalál-uddín's family in Iconium uninterruptedly for the last six hundred years, gave a new stimulus both to the zeal and energy and the poetical inspiration of the great sháikh. Most of his matchless odes, in which he soars on the wings of a genuine enthusiasm, high over earth and heaven up to the throne of Almighty God, were composed in honour of the Maulawí dervishes, and even his *opus magnum*, the *Mathnawí* or, as it is usually called, *The Spiritual Mathnawí* (*mathnawí-i-ma'nawí*), a production of the highest poetical and religious intuition in six books or *daftars*, with 30,000 to 40,000 double-rhymed verses, can be traced to the same source. The idea of this immense collection of ethical and moral precepts, interwoven with numerous anecdotes and comments on verses of the Korán and sayings of the Prophet, which the Eastern world reveres as the greatest devotional work, the study of which secures eternal bliss, was first suggested to the poet by his favourite disciple Hasan, better known as Husám-uddín, who became in 1258 Jalál-uddín's chief assistant. He had frequently observed that the members of the Maulawí fraternity read with great delight the mystic *mathnawís* of Saná'í and Faríd-uddín 'Attár, and induced his master to compose a similar poem on a larger scale. Jalál-uddín readily fell in with this suggestion and dictated to him, with a short interruption, the whole work during the remaining years of his life. Soon after the completion of this masterpiece Jalál-uddín died on the 17th of December 1273 (672 A.H. 5th of Jumádá II.), worshipped as a saint by high and low. His first successor in the rectorship of the Maulawí fraternity was Husám-uddín himself, after whose death in 1284 Jalál-uddín's younger and only surviving son, Shaikh Baháuddín Ahmed, commonly called Sultán Walad, and favourably known as author of the mystical *mathnawí*, *Rabábnáma*, or the Book of the Guitar (died 1312), was duly installed as grand-master of the order.

Jalál-uddín's life is fully described in Shams-uddín Ahmed Afákí's *Manáqib-ul-'drifín* (written between 718 and 754 A.H.), the most important portions of which have been translated by J. W. Redhouse in the preface to his English metrical version of *The Mesnevi, Book the First* (London, 1881; Trübner's Oriental series). Complete editions have been printed in Bombay, Lucknow, Tabriz, Constantinople, and in Bulak (with a Turkish translation, 1268 A.H.), at the end of which a seventh *daftar* is added, the genuineness of which is refuted by a remark of Jalál-uddín himself in one of the Bodleian copies of the poem, Ouseley, 294 (f. 328a sq.). The revised edition by 'Abd-ullatif (made between 1024 and 1032 A.H.) is still unpublished, but the same author's commentary on the *Mathnawí*, *Lata'if-ul-ma'naví*, and his glossary, *Lata'if-allughat*, have been lithographed in Cawnpore (1876) and Lucknow (1877) respectively, the latter under the title *Farhang-i-mathnawí*. For the other numerous commentaries and for further biographical and literary particulars of Jalál-uddín see Rieu's *Cat. of the Persian MSS. of the Brit. Mus.*, vol. ii. p. 584 sq.; A. Sprenger's *Oudh Cat.*, p. 489; Sir Gore Ouseley, *Notices of Persian Poets*, p. 112 sq.; and H. Ethé, in *Morgenländische Studien*, Leipsic, 1870, p. 95 sq. Select poems from Jalál-uddín's *diwán* (often styled *Diwán-i-Shams-i-Tabriz*) have been translated in German verse by V. von Rosenzweig, Vienna, 1838. (H. E.)

RUMINANTS. See MAMMALIA, vol. xv. p. 431.

RÜMKER, CARL LUDWIG CHRISTIAN (1788–1862), German astronomer, was born in Mecklenburg on May 28, 1788. He served in the British navy for some years until 1817; in 1821 he went to New South Wales as astronomer at the observatory built at Parramatta by Sir Thomas Brisbane (see OBSERVATORY, vol. xvii. p. 716). He returned to Europe in 1831, and took charge of the school of navigation at Hamburg and the observatory attached to it. His principal work is a *Catalogue* of 12,000 fixed stars from meridian observations made at Hamburg, published in 1843. In 1857 he retired and went to reside in Lisbon, where he died on December 21, 1862.

¹ *Rum Shrub* is a kind of liqueur, or cold punch, the basis of which is rum, lemon juice, and sugar. It is prepared by adding to 34 gallons of proof rum 2 oz. of the essential oil of orange and an equal quantity of essential oil of lemon dissolved in one quart of spirit, and 300 lb of refined sugar dissolved in 20 gallons of water. This combination is thoroughly mixed together, after which there is added sufficient orange juice or solution of tartaric acid to produce a slight pleasant acidity. After agitating the mixture again for some time, 20 gallons of water are added, bringing the quantity up to 100 gallons, and the agitation of the whole is continued for half an hour. In about a fortnight's time the shrub should be brilliant and ready for bottling. Other flavouring ingredients are occasionally added, and the compound may be varied according to taste.

RUNCIMAN, ALEXANDER (1736–1785), historical painter, was born in Edinburgh in 1736. He studied at the Foulis's Academy, Glasgow, and at the age of thirty proceeded to Rome where he spent five years. It was at this time that he became acquainted with Fuseli, a kindred spirit, between whose productions and those of Runciman there is a marked similarity. The painter's earliest efforts had been in landscape; "other artists," it was said of him, "talked meat and drink, but he talked landscape." He soon, however, turned to historical and imaginative subjects, exhibiting his *Nausicaa at Play with her Maidens* in 1767 at the Free Society of British Artists, Edinburgh. On his return from Italy, after a brief residence in London, where in 1772 he exhibited in the Royal Academy, he settled in Edinburgh, and was appointed master of the Trustees' Academy. He was patronized by Sir James Clerk, whose hall at Penicuik House he decorated with a series of subjects from Ossian. He also executed various religious paintings and an altarpiece in the Cowgate Episcopal Church, Edinburgh, and easel pictures of Cymon and Iphigenia, Sigismunda Weeping over the Heart of Tancred, and Agrippina Landing with the Ashes of Germanicus. He died in Edinburgh on October 4, 1785. His works, while they show high intention and considerable imagination, are frequently defective in form and extravagant in gesture.

RUNCIMAN, JOHN (1744–1766), historical painter, a younger brother of the above, accompanied him to Rome, and died at Naples in 1766. He was an artist of great promise. His *Flight into Egypt*, in the National Gallery of Scotland, is remarkable for the precision of its execution and the mellow richness of its colouring.

RUNCORN, a market-town and seaport of Cheshire, is pleasantly situated on the south side of the Mersey and near the terminus in that river of the Bridgewater, the Mersey and Irwell, and the Trent and Mersey Canals, 15 miles S.E. of Liverpool and 15 N.E. of Chester. The Mersey, which here contracts to 400 yards at high water, is crossed by a wrought-iron railway bridge 1500 feet in length. The modern prosperity of the town dates from the completion in 1773 of the Bridgewater Canal, which here descends into the Mersey by a succession of locks. The town was made an independent landing port in 1847, and within recent years large additions have been made to the docks and warehouses. The town possesses ship-building yards, iron foundries, rope works, tanneries, and soap and alkali works. The population of the urban sanitary district (area 1490 acres) in 1871 was 12,443, and in 1881 it was 15,126.

Owing to the Mersey being here fordable at low water, the place was in early times of considerable military importance. On a rock which formerly jutted some distance farther into the Mersey Ethelfleda erected a castle in 916, but of the building there are now no remains. She is also said to have founded a town, but probably it soon afterwards fell into decay, as it is not noticed in Domesday. The ferry is noticed in a charter in the 12th century.

RUNE. See ALPHABET, vol. i. pp. 607, 612, and SCANDINAVIAN LANGUAGES.

RUNEBERG, JOHAN LUDWIG (1804–1877), Swedish poet, was born at Jakobstad, in Finland, on the 5th of February 1804. Brought up by an uncle at Uleåborg, he entered the university of Åbo in the autumn term of 1822, and in 1826 began to contribute verses to the local newspapers. In the spring of 1827 he received the degree of doctor of philosophy, and shared in the calamity which, in September of the same year, destroyed the city and university of Åbo with fire. Runeberg accepted a tutorship at Saarijärvi, in the interior of Finland, where he remained for three years, studying hard and writing actively. The university had been removed after the great fire to Helsingfors, and in 1830 the young poet returned thither, as

amanuensis to the council of the university. In the same year he published his first volume of *Dikter* (Poems), and a collection of Servian folksongs translated into Swedish. In 1831 his verse romance *Grafven i Perrho* (The Grave in Perrho) received the small gold medal of the Swedish Academy, and the poet married the daughter of Dr Tengström, archbishop of Finland. For a tractate on the *Medea* of Euripides he was in the same year appointed university lecturer on Roman literature. In 1832 he leaped at one bound to the foremost place among Swedish poets with his beautiful little epic *Elgskyttarne* (The Elk-Hunters); and in 1833 he published a second collection of lyrical poems. His comedy *Fräaren från Landet* (The Country Lover) was not a success in 1834. He returned to more characteristic fields in 1836, when he published the charming idyl in hexameters called *Hanna*. In 1837 Runeberg accepted the chair of Latin at Borgå College, and resided in that little town for the rest of his life.

From Borgå he continued to pour forth volumes of verse, and he was now recognized in his remote Finland retirement as second only to Tegnér among the poets of Sweden. In 1841 he published *Nadeschda*, a romance of Russian life, and *Julquällen* (Christmas Eve), an idyl. The third volume of his lyrical pieces bears the date 1843, and the noble cycle of unrhymed verse romances called *Kung Fjalar* was published in 1844. Finally, in 1848, he achieved a great popular success by his splendid series of poems about the war of independence in 1808, a series which bears the name of *Fänrik Ståls Sägner* (Ensign Steel's Stories); a second series of these appeared in 1860. From 1847 to 1850 the poet was rector of Borgå College, a post which he laid down to take the only journey out of Finland which he ever accomplished, a visit to Sweden in 1851. His later writings may be briefly mentioned. In 1853 he collected his prose essays into a volume entitled *Smärre Berättelser*. In the same year he was made president of a committee for the preparation of a national Psalter, which issued, in 1857, a Psalm-Book largely contributed by Runeberg for public use. He once more attempted comedy in his *Kan ej* (Can't) in 1862, and tragedy, with infinitely more success, in his stately *Kungarne på Salamis* (The Kings at Salamis) in 1863. He collected his writings in six volumes in 1873–74. Runeberg died at Borgå on the 6th of May 1877.

The poems of Runeberg show the influence of the Greeks and of Goethe upon his mind; but he possesses a great originality. In an age of conventionality he was boldly realistic, yet never to the sacrifice of artistic beauty. Less known to the rest of Europe than Tegnér, he yet is now generally considered to excel him as a poet, and to mark the highest attainment hitherto reached by imaginative literature in Sweden.

The life of Johan Ludvig Runeberg has not yet been written in detail, although it is said to be in preparation. The fullest account of his life and works is that which forms the introduction to the *Samlade Skrifter* of 1873. It was written by Prof. Nyblom. A minute criticism of Runeberg's principal poems, with translations, occupies pp. 98–138 of Gosse's *Studies in the Literature of Northern Europe*, 1879. A selection of his lyrical pieces was published in an English translation by Messrs Magnusson and Palmer in 1878.

RUNNING. In this mode of progression the step is lighter and gait more rapid than in walking, from which it differs in consisting of a succession of springs from toe to toe, instead of a series of steps from toe to heel. As an athletic exercise, it has been in vogue from the earliest times, and the simple foot race, *δρομος*, run straight from starting point to goal, was a game of the Greek pentathlon. It was diversified with the *διανλοδρομος*, in which a distance mark was rounded and the starting and winning points were the same, and also by the *δρομος οπλιτών*, which might be compared to the modern heavy marching order race. In ancient Italy running was practised in circus exhibitions, as described by Virgil (*Æn.* v. 286 sq.). In modern times it has been developed almost into a science by the Anglo-Saxon race in Great Britain and North America, till the distances recently covered appear almost

fabulous compared with the performances up to the end of the first half of the century. In all kinds of running the entire weight of the body is thrown on the toes, from which light strides are taken with all possible freedom of action from the hips. At starting the feet are placed about a foot apart, the body being inclined slightly forward, with the weight of it on the right or hindmost foot. A bent double position with the feet wide apart is on no account advisable. The start cannot be made too quickly on the signal being given. Two or three short steps are taken to get fairly into stride, after which the runner should look straight before him, set his eyes steadfastly on the goal, and run towards it at his longest and quickest stride, care being taken not to swerve or get out of stride.

Running is usually thus classified:—(1) sprinting includes all distances up to 400 yards; (2) medium distances range from one quarter to three quarters of a mile; (3) long distances are those of one mile and upwards. The first-named is the most popular, and is much practised in the north of England, especially at Sheffield, which may be termed the home of sprint running. It is less fatiguing than long distances and requires less arduous training, while strength to a certain extent replaces wind. A great point in sprinting is to obtain a good start, for which purpose incessant practice is required. A first-class sprinter when at full speed will clear from 8 to 9 feet in each stride, and his toes leave the ground with inconceivable rapidity. When in good condition he will run 100 yards at top speed in one breath, and probably 150 yards without drawing a second one. The quickest authenticated times in which short distances have been run on perfectly level ground are as follows:—120 yards, 11½ sec.; 150 yards, 15 sec.; 200 yards, 19½ sec.; 300 yards, 30 sec.; and 400 yards, 43½ sec.

Of medium distances the quarter mile race is by far the most difficult to run, as a combination of speed and endurance is requisite. In fact a runner should be able to sprint the whole way. Six hundred yards and half a mile are the other chief distances in this class of running. The stride is slower than in sprinting, and a man cannot maintain the same speed throughout as is possible up to 300 yards. The best authenticated times are—quarter mile, 48½ sec.; 600 yards, 1 min. 11½ sec.; half mile, 1 min. 53½ sec.; 1000 yards, 2 min. 13 sec.; three quarter mile, 3 min. 7 sec.

Light wiry men are best fitted for long-distance running, where stamina and wind are more useful than speed. The strides must be long and light. After some miles a runner is unable to keep the weight of the body on his toes any longer owing to fatigue, puts his heels down, and runs flat-footed. The times accomplished of late years by long-distance runners are most remarkable. Those for the chief distances are as follows:—1 mile, 4 min. 16½ sec.; 2 miles, 9 min. 11½ sec.; 3 miles, 14 min. 36 sec.; 4 miles, 19 min. 36 sec.; 5 miles, 24 min. 40 sec.; 10 miles, 51 min. 6½ sec.; 20 miles, 1 h. 56 min. 38 sec.; 30 miles, 3 h. 15 min. 9 sec.; 40 miles, 4 h. 34 min. 27 sec.; 50 miles, 6 h. 8 min.; 100 miles, 13 h. 26 min. 30 sec.; 200 miles, 35 h. 9 min. 28 sec.; 300 miles, 53 h. 17 min. 6 sec.; 400 miles, 85 h. 52 min.; 500 miles, 109 h. 18 min. 20 sec.; 600 miles, 137 h. 25 min. 10 sec.; 610 miles, 140 h. 34 min. 10 sec.

Nearly all running contests now take place on prepared cinder paths, which from their springiness assist speed considerably. A runner's dress should be as light as possible, and consist merely of a thin jersey, a pair of drawers covering the waist and loins and extending downwards to the top of the knee caps, and heelless running shoes with a few short spikes in the soles just under the tread of the foot. The spikes are longer for sprinting. Chamois leather socks for the toes and ball of the foot may be added, since they diminish concussion as each foot reaches the ground. Since the introduction of ATHLETIC SPORTS (see vol. iii. p. 12) into England and America commenced in 1860 the popularity of amateur running races has vastly increased. These contests are governed by the rules of the Amateur Athletic Association. At Sheffield a code of rules has been drawn up for the regulation of the more important professional handicaps.

RUPERT (HRODBERT), St, a kinsman of the Merovingian house, and bishop of Worms, was invited (696) to Regensburg (Ratisbon) by Theodo of Bavaria, but finally settled in Salzburg, the bishopric of which was his foundation. He is regarded as the apostle of the Bavarians, not that the land was up to that time altogether heathen, but because of his services in the promotion and consolidation of its Christianity.

The *Gesta Sancti Hrodberti Confessoris* have been printed in the *Archiv für Oesterreich. Geschichte*, 1882, from a 10th-century MS.

RUPERT (1619–1682), prince of Bavaria, the third son of Frederick V., elector palatine and king of Bohemia, and of Elizabeth, sister of Charles I. of England, was born at Prague on December 18, 1619. In 1630 he was placed at the university of Leyden, where he showed particular readiness in languages and in military discipline. In 1633 he was with the prince of Orange at the siege of Rhynberg, and served against the Spaniards as a volunteer in the prince's life-guard. In December 1635 he was at the English court, and was named as leader of the proposed expedition to Madagascar. In 1636 he visited Oxford, when he was made master of arts. Returning to The Hague in 1638, he made the first display of his reckless bravery at the siege of Breda, and shortly afterwards was taken prisoner by the Austrians in the battle before Lemgo. For three years he was confined at Linz, where he withstood the endeavours made to induce him to change his religion and to take service with the emperor. Upon his release in 1642 he returned to The Hague, and from thence went to Dover, but, the Civil War not having yet begun, he returned immediately to Holland. Charles now named Rupert general of the horse, and he joined the king at Leicester in August 1642, being present at the raising of the standard at Nottingham. He was also made a knight of the Garter. It is particularly to be noticed that he brought with him several military inventions, and, especially, introduced the "German discipline" in his cavalry operations. He at once displayed the most astonishing activity, fought his first action with success at Worcester in September, and was at Edgehill on October 23. At Aylesbury and Windsor, on the march to London, he received severe checks, but after desperate fighting took Brentford. In 1643 he captured Cirencester, but failed before Gloucester, and in February issued his declaration denying the various charges of inhumanity which had been brought against him. At the end of March he set out from Oxford to join the queen at York, took Birmingham, and, after a desperate resistance, Lichfield, but was there suddenly recalled to the court at Oxford to meet Essex's expected attack. Chalgrove fight, at which during one of his incessant raids he met Hampden, was fought on June 18. On July 11 he joined the queen at Stratford-on-Avon, and escorted her to the king at Edgehill. He then began the siege of Bristol, which he took on July 26, and he took part in the futile attempt on Gloucester, where he failed to repulse Essex's relieving force. In the skirmish previous to the first battle of Newbury he checked the enemy's advance, and in the battle itself displayed desperate courage, following up the day's work by a night attack on the retiring army. In the beginning of 1644 he was rewarded by being made earl of Holderness, duke of Cumberland, and president of Wales. In February he was at Shrewsbury, from whence he administered the affairs of Wales; in March he went to relieve Newark, and was back at Shrewsbury by the end of the month. He then marched north, relieving Lathom and taking Bolton, and finally relieving York in July. At Marston Moor he charged and routed the Scots, but was in turn completely beaten by Cromwell's Ironsides. He escaped to York, and thence to Richmond, and finally by great skill reached Shrewsbury on July 20. On November 21 he was repulsed at Abingdon, and on 23d he entered Oxford with Charles. He had meanwhile been made generalissimo of the armies and master of the horse. Against him, however, was a large party of courtiers, with Digby at their head. The influence of the queen, too, was uniformly exerted against him. In May 1645 he took Newark by storm. His advice to march northwards was overruled, and on June 14 the experiences of Marston Moor were repeated at

Naseby. Rupert fled to Bristol, whence he counselled the king to come to terms with the parliament. In his conduct of the defence of the town, this "boldest attaquar in the world for personal courage" showed how much he "wanted the patience and seasoned head to consult and advise for defence" (Pepys). His surrender of the town after only a three weeks' siege, though he had promised Charles to keep it four months, caused his disgrace with the king, who revoked all his commissions by an order dated September 14, and in a cold letter ordered him to seek his subsistence beyond seas, for which purpose a pass was sent him. Rupert, however, broke through the enemy, reached the king at Oxford, and was there reconciled to him. He challenged an investigation of his conduct, and was triumphantly acquitted by the council of war. He appears, too, to have remonstrated personally with Charles in terms of indecent violence. He then applied to the parliament for a pass. This, however, was offered only on unacceptable conditions. On June 24 Rupert was taken prisoner by Fairfax at Oxford, and on July 5, at the demand of the parliament, sailed from Dover for France. He was immediately made a marshal in the French service, with the command of the English there. He received a wound in the head at Armentières during 1647. The greater part of the English fleet having adhered to Charles, and having sailed to Holland, Rupert went with the prince of Wales to The Hague, where the charge of it was put into his hand. He immediately set out in January 1649 upon an expedition of organized piracy. In February, after passing without molestation through the Parliamentary ships, he was at Kinsale, of which he took the fort. He relieved John Grenville at the Scilly Isles, and practically crippled the English trade. Attacked by Blake, he sailed to Portugal, and was received with kindness by the king; Blake, however, blockaded him in the Tagus, and demanded his surrender. Rupert broke through the blockade and sailed to the Mediterranean, landing at Barbary, and refitting at Toulon; thence he proceeded to Madeira, the Canaries (in 1652), the Azores, Cape de Verd, and the West Indies, sweeping the ocean between the latter places for a considerable time. Finding it impossible, however, to escape the indefatigable pursuit of Blake, he returned to France in 1653. He was now invited to Paris by Louis XIV., who made him master of the horse; he had also an offer from the emperor to command his forces. He travelled for some while, and was again in Paris in 1655. His movements, however, at this time are very uncertain, but he appears to have devoted his enforced leisure to engraving, chemistry, the perfection of gunpowder, and other arts, especially those of military science. Whether he was the actual discoverer of mezzotinto engraving, in which he was skilful, is uncertain, but this seems probable.

At the end of September 1660 Rupert returned to England; he was abroad during 1661, was placed on the privy council in April 1662, and in October was one of the commissioners for Tangiers; in December he became a member of the Royal Society. In August 1664 he was appointed to command the Guinea fleet against the Dutch, and set sail in October. On June 5, 1665, he gained with Monk a great victory over the Dutch, and on his return had his portrait painted by Lely along with the other admirals present at the battle. He again put to sea in May 1666, to hinder the junction of the Dutch and French, and returned in the beginning of June after a heavy defeat, his ship having stuck on the Galloper Sands during the fight. He was obliged to justify himself before the council. In January 1667 he was very ill, but recovered after the operation of trepanning. At this time he is mentioned as one of the best tennis players in the

nation. On October 22, 1667, he received with Monk the thanks of the House of Commons for his exertions against the Dutch at Chatham, and he was again at sea in April 1668. He was always staunch in his Protestant principles, and was carefully kept in ignorance of Charles's Catholic plot in 1670. In August of that year he was constable of Windsor, and busied himself with the fitting up of the Round Tower, a turret of which he converted into a workshop. He shared in the prevailing immorality of the time, his favourite mistress being the celebrated actress, Mrs Hughes. In 1673 he was appointed lord high admiral, and fought two battles with the Dutch Fleet on May 28 and August 11, but could do little through the backwardness of the French in coming to his assistance. This appears to have so annoyed him that he henceforward eagerly helped the anti-French party. He was an active member of the Board of Trade, and governor of the Hudson's Bay Company. Till his death, on November 29, 1682, he lived in complete retirement at Windsor. (O. A.)

RUPERT'S LAND. See HUDSON'S BAY COMPANY and NORTH-WEST TERRITORY.

RUPTURE. See HERNIA.

RUSH. Under the name of rush or rushes, the stalks or fistular stem-like leaves of several plants have minor industrial applications. The common rushes (species of *Juncus*) are used in many parts of the world for chair-bottoms, mats, and basket work, and the pith they contain serves as wicks in open oil-lamps and for tallow-candles,—whence rushlight. The bulrush, *Typha elephantina*, is used in Sindh for mats and baskets. Under the name of rushes, species of *Scirpus* and other *Cyperaceæ* are used for chair-bottoms, mats, and thatch. The elegant rush mats of Madras are made from *Papyrus pangorei*. The sweet rush, yielding essential oil, is *Andropogon Schoenanthus*, known also as lemon grass. Large quantities of the "horse tail," *Equisetum hiemale*, are used under the name of the Dutch or scouring rush, for scouring metal and other hard surfaces on account of the large proportion of silica the plant contains.

RUSH, BENJAMIN (1745–1813), the Sydenham of America, was born near Bristol (12 miles from Philadelphia), on a homestead founded by his grandfather, who had followed Penn from England in 1683, being of the Quaker persuasion, and a gunsmith by trade. After a careful education at school and college, and an apprenticeship of six years with a doctor in Philadelphia, Rush went for two years to Edinburgh, where he attached himself chiefly to Cullen. He took his M.D. degree there in 1768, spent a year more in the hospitals of London and Paris, and began practice in Philadelphia at the age of twenty-four, undertaking at the same time the chemistry class at the new medical school. He at once became a leading spirit in the political and social movements of the day. He was a friend of Franklin's, a member of Congress for the State of Pennsylvania in 1776, and one of those who signed the Declaration of Independence the same year. He had already written on the Test Laws, "Sermons to the Rich," and on Negro Slavery, having taken up the last-named subject at the instance of Anthony Benezet, whose *Historical Account of Guinea* was the inspiration of Clarkson's celebrated college essay twelve years after. In 1774 he started along with James Pemberton the first anti-slavery society in America, and was its secretary for many years. When the political crisis ended in 1787 with the convention for drawing up a federal constitution, of which he was a member, he retired from public life, and gave himself up wholly to medical practice. In 1789 he exchanged his chemistry lectureship for that of the theory and practice of physic;

and when the medical college, which he had helped to found, was absorbed by the university of Pennsylvania in 1791 he became professor of the institutes of medicine and of clinical practice, succeeding in 1805 to the chair of the theory and practice of physic. He was the central figure in the medical world of Philadelphia, as Cullen was at Edinburgh and Boerhaave at Leyden. Much of his influence and success was due to his method and regularity of life on the Franklin model. During the thirty years that he attended the Pennsylvania Hospital as physician, he is said to have never missed his daily visit and never to have been more than ten minutes late. Notwithstanding a weak chest, which troubled him the greater part of his life, he got through an enormous amount of work, literary and other; he was a systematic early riser, and his leisure at the end of the day was spent in reading poetry, history, the moral sciences, and the like, with his pen always in his hand. His temperament was of the gentle sort, and his conversation and correspondence abounding in ideas. It is stated by his friend Dr Hosack of New York, that Rush was successively a Quaker, an Anabaptist, a Presbyterian, and an Anglican. He gained great credit when the yellow fever devastated Philadelphia, in 1793, by his assiduity in visiting the sick (as many as one hundred and twenty in a day), and by his bold and apparently successful treatment of the disease by bloodletting. When he began to prosper in practice, he gave a seventh part of his income in charity. He died in 1813, after a five days' illness from typhus fever. Nine out of a family of thirteen children survived him, all prosperously settled.

Rush's writings cover an immense range of subjects, including language, the study of Latin and Greek, the moral faculty, capital punishment, medicine among the American Indians, maple sugar, the blackness of the negro, the cause of animal life, tobacco smoking, spirit drinking, as well as a long list of more strictly professional topics. His last work was an elaborate treatise on the *Diseases of the Mind* (1812). He is best known now by the five volumes of *Medical Inquiries and Observations*, which he brought out at intervals from 1789 to 1798 (two later editions revised by the author). Epidemiology, and yellow fever in particular, was the subject on which he wrote to most purpose. His treatment of yellow fever by bloodletting helped more than anything else to make him famous, although the practice would now be condemned. His views as to the origin and diffusion of yellow fever have a more permanent interest. He stoutly maintained, as against the doctrine of importation from the West Indies, that the yellow fever of Philadelphia was generated on the spot by noxious exhalations, although he does not appear to have suspected that there was something special or specific in the filthy conditions of soil or harbour mud which gave rise to the miasmata. For a number of years he expressed the opinion that yellow fever might become catching from person to person, under certain aggravated circumstances; but in the end he professed the doctrine of absolute non-contagiousness. He became well known in Europe as an authority on the epidemics of fever, and was elected an honorary member of several foreign societies.

See eulogy by Hosack (*Essays*, i., New York, 1834), with biographical details taken from a letter of Rush to President John Adams; also references in the works of Thacker, Gross, and Bowditch on the history of medicine in America. His part in the yellow fever controversies is indicated by La Roche (*Yellow Fever in Philadelphia from 1689 to 1854*, 2 vols., Philadelphia, 1855) and by Bancroft (*Essay on the Yellow Fever*, London, 1811). His services as an abolitionist pioneer are recorded in Clarkson's *History of the Abolition of the African Slave Trade*.

RUSHWORTH, JOHN (c. 1607–1690), the compiler of the *Historical Collections* commonly described by his name, was born in Northumberland about the year 1607. After a period of study at Oxford, but not, it appears, as a member of the university, he came to London, was entered at Lincoln's Inn, and was in due course called to the bar. As early as 1630 he seems to have commenced attendance at the courts, especially the Star Chamber and the Exchequer Chamber, not for the purpose of practising his profession, but in order that he might observe and record the more remarkable of their proceedings. On the meeting of the Long Parliament in 1640 he was appointed assistant clerk to the House of Commons, and was in the habit of

making short-hand notes of the speeches he heard delivered in debate. He himself states that it was from his report that the words used by Charles I. during his memorable attempt to seize the "five members" were printed for public distribution under the king's orders. Being an expert horseman, it seems that Rushworth was frequently employed by the House as their messenger as well as in the capacity of clerk. When the king left London, and while the earl of Essex was general, he was often the bearer of communications from the parliament to one or the other of them. In 1645 Sir Thomas Fairfax, to whom he was distantly related, and who was then in command of the Parliamentary forces, made him his secretary, and he remained with the army almost continuously until 1650. In 1649 he was at Oxford, and the degree of master of arts was conferred on him by the university. In 1652 he was nominated one of the commissioners for the reform of the common law, and in 1658 he was elected member for Berwick in the parliament of the commonwealth. Almost immediately before the Restoration he published the first volume of his *Historical Collections*, which had been submitted in manuscript to Oliver Cromwell, with a very laudatory dedication to Richard Cromwell, then Lord Protector. But the turn of events induced him to withdraw this dedication, and he subsequently endeavoured without success to conciliate Charles II. by presenting him with some of the registers of the privy council which had come into his possession. In the convention of 1660, which recalled the king, he sat again as member for Berwick. In 1677 he was made secretary to Sir Orlando Bridgeman, then lord keeper, and he was returned for Berwick a third and a fourth time to the parliaments of 1679 and 1681. Soon after this he appears to have fallen into straitened circumstances. In 1684 he was arrested for debt, and cast into the King's Bench prison, where he died, after lingering for some time in a condition of mental infirmity, the result of excessive drinking, in 1690.

Rushworth's *Historical Collections of Private Passages of State, Weighty Matters in Law, and Remarkable Proceedings in Parliament* was reprinted in eight folio volumes in 1721. The eighth volume of this edition is an account of the trial of the earl of Strafford, the other seven volumes being concerned with the miscellaneous transactions of the period from 1618 to 1648. Only the first three volumes and the trial of Strafford were originally published in Rushworth's lifetime; but the manuscript of the other volumes was left by him ready for the press. The extreme value of the work is well known to all inquirers into the history of the Civil War, and much of the information it contains is to be found nowhere else. Its impartiality, however, can hardly be seriously maintained, and hence it is necessary to consult it with some caution.

RUSSELL, JOHN RUSSELL, EARL (1792–1878), a statesman who for nearly half a century faithfully represented the traditions of Whig politics, was the third son of John, sixth duke of Bedford, and was born in Hertford Street, Mayfair, London, 18th August 1792, one of the most terrible months in the annals of the French Revolution. Whilst still a child he was sent to a private school at Sunbury, and for a short time he was at Westminster School. Long and severe illness led to his being placed, with many other young men sprung from Whig parents, with a private tutor at Woodnesborough in Kent. Following in the footsteps of Lord Henry Petty, Brougham, and Horner, he went to the university of Edinburgh, then the academic centre of Liberalism, and dwelt in the house of Prof. Playfair, whom he afterwards described as "one of the best and noblest, the most upright, the most benevolent, and the most liberal of all philosophers." On leaving the university, he determined upon taking a foreign tour, and, as the greater part of Europe was overrun by French troops, he landed at Lisbon with the intention of exploring the countries of Portugal and Spain. Lord John

Russell had previously arrived at the conclusion that the continuance of the war with France was necessary for the restoration of the peace of Europe, and his convictions were deepened by the experience of travel. On the 4th May 1813, ere he was of age, he was returned for the ducal borough of Tavistock, and in this he resembled Lord Chesterfield and other aristocratic legislators, who were entrusted with the duty of law-making before they had arrived at years of discretion. After the battle of Waterloo the Whig representatives in parliament concentrated their efforts in promoting financial reform, and in resisting those arbitrary settlements of the Continental countries which found favour in the eyes of Metternich and Castlereagh. In foreign politics Lord John Russell's oratorical talents were especially shown in his struggles to prevent the union of Norway and Sweden. In domestic questions he cast in his lot with those who opposed the repressive measures of 1817, and protested that the causes of the discontent at home should be removed by remedial legislation. When failure attended all his efforts he resigned his seat for Tavistock, and meditated permanent withdrawal from public life, but was dissuaded from this step by the arguments of his friends, and especially by a poetic appeal from Tom Moore. In the parliament of 1818-20 he again represented the family borough in Devon, and in May 1819 began his long advocacy of parliamentary reform by moving for an inquiry into the corruption which prevailed in the Cornish constituency of Grampound. During the first parliament (1820-26) of George IV. the county of Huntingdon accepted Lord John Russell's services as its representative, and it was his good fortune to secure in 1821 the disfranchisement of Grampound, but his satisfaction at this triumph was diminished by the fact that the seats were not transferred to the constituency which he desired. This was the sole parliamentary victory which the advocates of a reform of the representation obtained before 1832, but they found cause for congratulation in other triumphs. Lord John Russell paid the penalty for his advocacy of Catholic emancipation with the loss in 1826 of his seat for Huntingdon county, but he found a shelter in the Irish borough of Bandon Bridge. He led the attack against the Test Acts by carrying in February 1828 with a majority of forty-four a motion for a committee to inquire into their operations, and after this decisive victory they were repealed. He warmly supported the Wellington ministry when it realized that the king's government could only be carried on by the passing of a Catholic Relief Act. For the greater part of the short-lived parliament of 1830-31 he served his old constituency of Tavistock, having been beaten in a contest for Bedford county at the general election by one vote; and, when Lord Grey's Reform ministry was formed, Lord John Russell accepted the office of paymaster-general, though, strange to say, he was not admitted into the sacred precincts of the cabinet. This exclusion from the official hierarchy was rendered the more remarkable by the circumstance that he was selected (1st March 1831) to explain the provisions of the Reform Bill, to which the cabinet had given its formal sanction. The Whig ministry were soon met by defeat, but an appeal to the country increased the number of their adherents, and Lord John Russell himself had the satisfaction of being chosen by the freeholders of Devon as their member. After many a period of doubt and defeat, "the bill, the whole bill, and nothing but the bill" passed into law, and Lord John stood forth in the mind of the people as its champion. Although it was not till some years later that he became the leader of the Liberal party, the height of his fame was attained in 1832. After the passing of the Reform Bill he sat for the southern division of Devon, and continued to retain

the place of paymaster-general in the ministries of Lord Grey and Lord Melbourne. The former of these cabinets was broken up by the withdrawal of Mr Stanley, afterwards Lord Derby, on the proposal for reforming the Irish Church, when he emphasized Lord John Russell's part in the movements by the saying "Johnny's upset the coach;" the latter was abruptly, if not rudely, dismissed by William IV. when the death of Lord Spencer promoted the leader of the House of Commons, Lord Althorp, to the peerage, and Lord John Russell was proposed as the spokesman of the ministry in the Commons. At the general election which ensued the Tories received a considerable accession of strength, but not sufficient to ensure their continuance in office, and the adoption by the House of Commons of the proposition of the Whig leader, that the surplus funds of the Irish Church should be applied to general education, necessitated the resignation of Sir Robert Peel's ministry. In Lord Melbourne's new administration Lord John Russell became home secretary and leader of the House of Commons, but on his seeking a renewal of confidence from the electors of South Devon, he was defeated and driven to Stroud. Although the course of the Whig ministry was not attended by uniform prosperity, it succeeded in passing a Municipal Reform Bill, and in carrying a settlement of the tithe question in England and Ireland. At the close of its career the troubles in Canada threatened a severance of that dependency from the home country, whereupon Lord John Russell, with a courage which never deserted him, took charge of the department, at that time a dual department, of war and the colonies. In May 1839, on an adverse motion concerning the administration of Jamaica, the ministry was left with a majority of five only, and promptly resigned the seals of office. Sir Robert Peel's attempt to form a ministry was, however, frustrated by the refusal of the queen to dismiss the ladies of the bedchamber, and the Whigs resumed their places. Their prospects brightened when Sir John Yarde Buller's motion of "no confidence" was defeated by twenty-one, but the glimpse of sunlight soon faded, and a similar vote was some months later carried by a majority of one, whereupon the Whig leader announced a dissolution of parliament (1841). At the polling booth his friends were smitten hip and thigh; the return of Lord John Russell for the City of London was almost their solitary triumph. On Sir Robert Peel's resignation (1846) the task of forming an administration was entrusted to Lord John Russell, and he remained at the head of affairs from 1846 to 1852, but his tenure of office was not marked by any great legislative enactments. His celebrated Durham letter on the threatened assumption of ecclesiastical titles by the Roman Catholic bishops weakened the attachment of the "Peelites" and alienated his Irish supporters. The impotence of their opponents, rather than the strength of their friends, kept the Whig ministry in power, and, although beaten by a majority of nearly two to one on Mr Locke King's County Franchise Bill in February 1851, it could not divest itself of office. Lord Palmerston's unauthorized recognition of the French *coup d'état* was followed by his dismissal, but he had his revenge in the ejection of his old colleagues a few months later. During Lord Aberdeen's administration Lord John Russell led the Lower House, at first as foreign secretary, then without portfolio, and lastly as president of the council. In 1854 he brought in a Reform Bill, but in consequence of the war with Russia the bill was allowed, much to its author's mortification, to drop. His popularity was diminished by this failure, and although he resigned in January 1855, on Mr Roebuck's Crimea motion, he did not regain his old position in the country. At the Vienna conference (1855) Lord John Russell was England's representative, and immediately on his return

he became secretary of the colonies; but the errors in his negotiations at the Austrian capital followed him and forced him to retire. For some years after this he was the "stormy petrel" of politics. He was the chief instrument in defeating Lord Palmerston in 1857. He led the attack on the Tory Reform Bill of 1859. A reconciliation was then effected between the rival Whig leaders, and Lord John Russell consented to become foreign secretary in Lord Palmerston's ministry, and to accept an earldom. During the American War Earl Russell's sympathies with the North restrained his country from embarking in the contest, but he was not equally successful in his desire to prevent the spoliation of Denmark. On Lord Palmerston's death (October 1865) Earl Russell was once more summoned to form a cabinet, but the defeat of his ministry in the following June on the Reform Bill which they had introduced was followed by his retirement from public life. His leisure hours were spent after this event in the preparation of numberless letters and speeches, and in the composition of his *Recollections and Suggestions*, but everything he wrote was marked by the belief that all philosophy, political or social, was summed up in the Whig creed of fifty years previously. Earl Russell died at Pembroke Lodge, Richmond Park, 28th May 1878.

For more than half a century Earl Russell lived in the excitement of political life. He participated in the troubles of Whiggism before 1832, and shared in its triumph after that event. He expounded the principles of the first Reform Bill and lived to see a second carried into law by the Conservative ministry of Lord Derby. Unlimited confidence in his own resources exposed him to many jests from both friend and foe, but he rightly estimated his powers, and they carried him to the highest places in the state. His tragedies and his essays are forgotten, but his works on Fox are among the chief authorities on Whig politics. Earl Russell was twice married, —first, in 1835, to Adelaide, daughter of Mr Thomas Lister, and widow of Thomas, second Lord Ribblesdale, and secondly, in 1841, to Lady Frances Ann Maria, daughter of the second earl of Minto. By the former he had two daughters, by the latter three sons and one daughter. His eldest son, Lord Amberley, predeceased him 9th January 1876. (W. P. C.)

RUSSELL, WILLIAM RUSSELL, LORD (1639–1683), the third son of Lord Russell, afterwards fifth earl and still later first duke of Bedford, and Lady Anne Carr, daughter of the infamous countess of Somerset, was born September 29, 1639. Nothing is known of his early youth, except that about 1654 he was sent to Cambridge with his elder brother Francis. On leaving the university, the two brothers travelled abroad, visiting Lyons and Geneva, and residing for some while at Augsburg. His account of his impressions is spirited and interesting. He was at Paris in 1658, but had returned to Woburn in December 1659. At the Restoration he was elected for the family borough of Tavistock. For a long while he appears to have taken no part in public affairs, but rather to have indulged in the follies of court life and intrigue; for both in 1663 and 1664 he was engaged in duels, in the latter of which he was wounded. In 1669 he married the second daughter of the earl of Southampton, the widow of Lord Vaughan, thus becoming connected with Shaftesbury, who had married Southampton's niece. With his wife Russell always lived on terms of the greatest affection and confidence.

It was not until the formation of the "country party," in opposition to the policy of the Cabal and Charles's French-Catholic plots, that Russell began to take an active part in affairs. He then joined Cavendish, Birch, Hampden, Powell, Lyttleton, and others in vehement antagonism to the court. With a passionate hatred and distrust of the Catholics, and an intense love of political liberty, he united the desire for ease to Protestant Dissenters. His first speech appears to have been on January 22, 1673, in which he inveighed against the stop of the exchequer, the attack on the Smyrna fleet, the corruption of courtiers with French money, and "the ill ministers about the king."

He also supported the proceedings against the duke of Buckingham. In 1675 he moved an address to the king for the removal of Danby from the royal councils, and for his impeachment. On February 15, 1677, in the debate on the fifteen months' prorogation, he moved the dissolution of parliament; and in March 1678 he seconded the address praying the king to declare war against France. The enmity of the country party against Danby and James, and their desire for a dissolution and the disbanding of the army, were greater than their enmity to Louis. The French king therefore found it easy to form a temporary alliance with Russell, Hollis, and the opposition leaders, by which they engaged to cripple the king's power of hurting France, and to compel him to seek Louis's friendship,—that friendship, however, to be given only on the condition that they in their turn should have Louis's support for their cherished objects. Russell in particular entered into close communication with Rouvigny, who came over with money for distribution among members of parliament. By the testimony of Barillon, however, it is clear that Russell himself utterly refused to take any part in the intended corruption.

By the wild alarms which culminated in the Popish Terror Russell appears to have been affected more completely than his otherwise sober character would have led people to expect. He threw himself into the party which looked to Monmouth as the representative of Protestant interests, a grave political blunder, though he afterwards was in confidential communication with Orange. On November 4, 1678, he moved an address to the king to remove the duke of York from his person and councils. At the dissolution of the pensionary parliament, he was, in the new elections, returned for Bedfordshire. Danby was at once overthrown, and in April 1679 Russell was one of the new privy council formed by Charles on the advice of Temple. Only six days after this we find him moving for a committee to draw up a bill to secure religion and property in case of a Popish successor. He does not, however, appear to have taken part in the exclusion debates at this time. In June, on the occasion of the Covenanters' rising in Scotland, he attacked Lauderdale personally in full council.

In January 1680 Russell, along with Cavendish, Capell, Powell, Essex, and Lyttleton, tendered his resignation to the king, which was received by Charles "with all my heart." On June 16 he accompanied Shaftesbury, when the latter indicted James at Westminster as a Popish recusant; and on October 26 he took the extreme step of moving "how to suppress Popery, and prevent a Popish successor"; while on November 2, now at the height of his influence, he went still further by seconding the motion for exclusion in its most emphatic shape, and on the 19th carried the bill to the House of Lords for their concurrence. The limitation scheme he opposed, on the ground that monarchy under the conditions expressed in it would be an absurdity. The statement, made by Echard alone, that he joined in opposing the indulgence shown to Lord Strafford by Charles in dispensing with the more horrible parts of the sentence of death—an indulgence afterwards shown to Russell himself—is entirely unworthy of credence. On December 18 he moved to refuse supplies until the king passed the Exclusion Bill. The Prince of Orange having come over at this time, there was a tendency on the part of the opposition leaders to accept his endeavours to secure a compromise on the exclusion question. Russell, however, refused to give way a hair's breadth.

On March 26, 1681, in the parliament held at Oxford, Russell again seconded the Exclusion Bill. Upon the dissolution he retired into privacy at his country seat of Stratton in Hampshire. It was, however, no doubt at his wish that his chaplain wrote the *Life of Julian the Apost-*

tate, in reply to Dr Hickes's sermons, in which the lawfulness of resistance in extreme cases was defended. In the wild schemes of Shaftesbury after the election of Tory sheriffs for London in 1682 he had no share; upon the violation of the charters, however, in 1683, he began seriously to consider as to the best means of resisting the Government, and on one occasion attended a meeting at which treason, or what might be construed as treason, was talked. Monmouth, Essex, Hampden, Sidney, and Howard of Escrick were the principal of those who met to consult. On the breaking out of the Rye Plot, of which neither he, Essex, nor Sidney had the slightest knowledge, he was accused by informers of promising his assistance to raise an insurrection and compass the death of the king. Refusing to attempt to escape, he was brought before the council, when his attendance at the meeting referred to was charged against him. He was sent on June 26, 1683, to the Tower, and, looking upon himself as a dying man, betook himself wholly to preparation for death. Monmouth offered to appear to take his trial, if thereby he could help Russell, and Essex refused to abscond for fear of injuring his friend's chance of escape. Before a committee of the council Russell, on June 28, acknowledged his presence at the meeting, but denied all knowledge of the proposed insurrection. He reserved his defence, however, until his trial. He would probably have saved his life but for the perjury of Lord Howard. The suicide of Essex, the news of which was brought into court during the trial, was quoted as additional evidence against him, as pointing to the certainty of Essex's guilt. On July 19 he was tried at the Old Bailey, his wife assisting him in his defence. Evidence was given by an informer that, while at Shaftesbury's hiding-place in Wapping, Russell had joined in the proposal to seize the king's guard, a charge indignantly denied by him in his farewell paper, and that he was one of a committee of six appointed to prepare the scheme for an insurrection. Howard, too, expressly declared that Russell had urged the entering into communications with Argyll in Scotland. Howard's perjury is clear from other witnesses, but the evidence was accepted. Russell spoke with spirit and dignity in his own defence, and, in especial, vehemently denied that he had ever been party to a design so wicked and so foolish as those of the murder of the king and of rebellion. It will be observed that the legality of the trial, in so far as the jurors were not properly qualified and the law of treason was shamefully strained, was denied in the Act of 1 William and Mary which annulled the attainder. Hallam maintains that the only overt act of treason proved against Russell was his concurrence in the project of a rising at Taunton, which he denied, and which, Ramsay being the only witness, was not sufficient to warrant a conviction.

Russell was sentenced to die. Many attempts were made to save his life. The old earl of Bedford offered £50,000 or £100,000, and Monmouth, Legge, Lady Ranelagh, and Rochester added their intercessions. Russell himself, in petitions to Charles and James, offered to live abroad if his life were spared, and never again to meddle in the affairs of England. He refused, however, to yield to the influence of Burnet and Tillotson, who endeavoured to make him grant the unlawfulness of resistance, although it is more than probable that compliance in this would have saved his life. He drew up, with Burnet's assistance, a paper containing his apology, and he wrote to the king a letter, to be delivered after his death, in which he asked Charles's pardon for any wrong he had done him. A suggestion of escape from Lord Cavendish he refused. He behaved with his usual quiet cheerfulness during his stay in the Tower, spending his last day on earth as he had intended to spend the following Sunday if he had reached it. He

received the sacrament from Tillotson, and Burnet twice preached to him. Having supped with his wife, the parting from whom was his only great trial, he slept peacefully, and spent the last morning in devotion with Burnet. He went to the place of execution in Lincoln's Inn Fields with perfect calmness, which was preserved to the last. He died on July 21, 1683, in the forty-fourth year of his age.

A true and moderate summing up of his character will be found in his *Life*, by Lord John Russell. (O. A.)

RUSSELL, JOHN SCOTT (1808-1882), was born in 1808 near Glasgow, a "son of the manse," and was at first destined for the ministry. But this intention on his father's part was changed in consequence of the boy's early leanings towards practical science. He attended in succession the universities of St Andrews, Edinburgh, and Glasgow, — taking his degree in the last-named at the age of sixteen. After spending a couple of years in workshops, he settled in Edinburgh as a lecturer on science, and soon collected large classes. In 1832-33 he was engaged to give the natural philosophy course at the university, the chair having become vacant by the death of Leslie. In the following year he began that remarkable series of observations on waves whose results, besides being of very great scientific importance, were the chief determining factor of his subsequent practical career. Having been consulted as to the possibility of applying steam-navigation to the Edinburgh and Glasgow Canal, he replied that the question could not be answered without experiments, and that he was willing to undertake such if a portion of the canal were placed at his disposal. The results of this inquiry are to be found in the *Transactions of the Royal Society of Edinburgh* (vol. xiv.), and in the *British Association Reports* (seventh meeting). We need not say more than that the existence of the *long wave*, or *wave of translation*, as well as many of its most important features, were here first recognized, and (to give one very simple idea of the value of the investigation) that it was clearly pointed out *why* there is a special rate, depending on the depth of the water, at which a canal-boat can be towed at the least expenditure of effort by the horse. The elementary mathematical theory of the long wave is very simple, and was soon supplied by commentators on Scott Russell's work; a more complete investigation has been since given by Stokes; and the subject may be considered as certainly devoid of any special mystery. Russell held an opposite opinion, and it led him to many extraordinary and groundless speculations, some of which have been published in a posthumous volume, *The Wave of Translation* (1885). His observations led him to propose and experiment on a new system of shaping vessels, which is known as the *wave system*. This culminated in the building of the enormous and unique "Great Eastern," of which it has been recently remarked by a competent authority that "it is probable that, if a new 'Great Eastern' were now to be built, the system of construction employed by Mr Scott Russell would be followed exactly."

Though his fame will rest chiefly on the two great steps we have just mentioned, Scott Russell's activity and ingenuity displayed themselves in many other fields, — steam-coaches for roads, improvements in boilers and in marine engines, the immense iron dome of the Vienna exhibition, cellular double bottoms for iron ships, &c. Along with Mr Stafford Northcote (now Lord Iddesleigh), he was joint secretary of the Great Exhibition of 1851; and he was one of the chief founders of the Institution of Naval Architects, from the twenty-third volume of whose *Transactions* we have extracted much of what is stated above. Russell contributed the articles STEAM, STEAM-ENGINE, STEAM NAVIGATION, &c., to the 7th edition of the *Encyclopædia Britannica*. He died at Ventnor. June 8, 1882.

R U S S I A

PART I.—GENERAL SURVEY OF THE RUSSIAN EMPIRE.

Plate II.

THE Russian empire is a very extensive territory in eastern Europe and northern Asia, with an area exceeding 8,500,000 square miles, or one sixth of the land surface of the globe (one twenty-third of its whole superficies). It is, however, but thinly peopled on the average, including only one-fourteenth of the inhabitants of the earth. It is almost entirely confined to the cold and temperate zones. In Nova Zembla (Novaya Zemlya) and the Taimyr peninsula, it projects within the Arctic Circle as far as 77° 2' and 77° 40' N. lat.; while its southern extremities reach 38° 50' in Armenia, about 35° on the Afghan frontier, and 42° 30' on the coasts of the Pacific. To the west it advances as far as 20° 40' E. long. in Lapland, 18° 32' in Poland, and 29° 42' on the Black Sea; and its eastern limit—East Cape in the Behring Strait—extends to 191° E. longitude.

Boundaries.

The Arctic Ocean—comprising the White, Barents, and Kara Seas—and the northern Pacific, that is, the Seas of Behring, Okhotsk, and Japan, bound it in the north and east. The Baltic, with its two deep indentations, the Gulfs of Bothnia and Finland, limits it on the north-west; and two sinuous lines of frontier separate it respectively from Sweden and Norway on the north-west and from Prussia, Austria, and Roumania on the west. The southern frontier is still unsettled, and has never remained unaltered for so many as twenty consecutive years. Quite recently it has been pushed southwards, on both the western and the eastern shores of the Black Sea, parts of Roumania and Asia Minor having been annexed in 1878. In Asia, beyond the Caspian, the southern boundary of the empire remains vague; the advance into the Turcoman Steppes and Afghan Turkestan and on the Pamir plateau is still in progress. Bokhara and Khiva, though represented as vassal khanates, are in reality mere dependencies of Russia. An approximately settled frontier-line begins only farther east, where the Russian and the Chinese empires meet on the borders of Eastern Turkestan, Mongolia, and Manchuria. But even there, the province of Kuldja has recently been occupied by Russia, and again restored to China; while in eastern Mongolia, the great overland route from Kiakhta to Peking, *via* Urga, is in fact in the hands of Russia, and it is difficult to predict how far Russian influence may extend should circumstances lead it to seek a footing on the thinly-peopled plateaus of Central Asia.

Islands.

Russia has no oceanic possessions, and has abandoned those she owned in last century; her islands are mere appendages of the mainland to which they belong. Such are the Åland archipelago, Hochland, Tüters, Dagö, and Ösel in the Baltic Sea; Nova Zembla, with Kolgueff and Vaigatch, in the Barents Sea; the Sofovetsky Islands in the White Sea; the New Siberian archipelago, and the small group of the Medvyezhi Islands off the Siberian coast; the Commander Islands off Kamchatka; the Shantar Islands and Saghalin in the Sea of Okhotsk. The Aleutian archipelago was sold to the United States in 1867, together with Alaska, and in 1874 the Kurile Islands were ceded to Japan.

Leading physical features.

A vast variety of physical features is obviously to be expected in a territory like this, which comprises on the one side the cotton and silk regions of Turkestan and Transcaucasia, and on the other the moss and lichen-clothed Arctic tundras and the Verkhoysansk Siberian pole of cold—the dry Transcaspian deserts and the regions watered by the monsoons on the coasts of the Sea of Japan. Still, if the border regions, that is, two narrow belts in the north

and south, be left out of account, a striking uniformity of physical feature prevails. High plateaus, like those of Pamir (the “Roof of the World”) or of Armenia, and high mountain chains like the snow-clad summits of the Caucasus, the Alay, the Thian-Shan, the Sayan, are met with only on the outskirts of the empire.

Viewed broadly by the physical geographer, it appears as occupying the territories to the north-west of that great plateau-belt of the old continent—the backbone of Asia—which spreads with decreasing height and width from the high tableland of Tibet and Pamir to the lower plateaus of Mongolia, and thence north-eastwards through the Vitim region to the furthest extremity of Asia. It may be said to consist of the immense plains and flat lands which extend between the plateau-belt and the Arctic Ocean, including also the series of parallel chains and hilly spurs which skirt the plateau-belt on the north-west. It extends over the plateau itself, and crosses it, beyond Lake Baikal only.

This belt—the oldest geological continent of Asia—being unfit for agriculture and for the most part unsuited for permanent settlement, while the oceanic slopes of it have from the dawn of history been occupied by a dense population, has long prevented Slavonian colonization from reaching the Pacific. Russians happened to cross it in the 17th century, only in its narrowest and most northerly part, thus reaching the Pacific on the foggy and frozen coasts of the Sea of Okhotsk; and two centuries elapsed ere, after colonizing the depressions of the plateau around Lake Baikal, the Russians crossed the plateau in a more genial zone and descended to the Pacific by the Amur, rapidly spreading farther south, up the nearly uninhabited Usuri, to what is now the Gulf of Peter the Great. In the south-western higher portions of the plateau-belt the empire has only recently planted its foot on the Pamir; as we write, it is endeavouring to get command of the lower passages which give an easy access to the Afghan portion of the plateau; while already, within the present century, it has established itself firmly on the plateaus of Armenia.

A broad belt of hilly tracts—in every respect alpine in character, and displaying the same variety of climate and organic life as alpine tracts usually do—skirts the plateau-belt throughout its length on the north and north-west, forming an intermediate region between the plateaus and the plains. The Caucasus, the Elburz, the Kopet-dagh, and Paropamisus, the intricate and imperfectly known network of mountains west of the Pamir, the Thian-Shan and Ala-tau mountain regions, and farther north-east the Altai, the still unnamed complex of Minusinsk mountains, the intricate mountain-chains of Sayan, with those of the Olekma, Vitim, and Aldan, all of which are ranged *en échelon*—the former from north-west to south-east, and the others from south-west to north-east—all of these belong to one immense alpine belt bordering that of the plateaus. These have long been known to Russian colonists, who, seeking to escape religious prosecutions and exactions by the state, early penetrated into and rapidly pushed their small settlements up the better valleys of these tracts, and continued to spread everywhere as long as they found no obstacles in the shape of a former population or in unfavourable climatic conditions.

As for the flat-lands which extend from the Alpine hill-foots to the shores of the Arctic Ocean, and assume the character either of dry deserts in the Aral-Caspian depression, or of low table-lands in central Russia and eastern Siberia, of lake-regions in north-west Russia and Finland, or of marshy prairies in western Siberia, and of

tundras in the far north,—their monotonous surfaces are diversified by only a few, and these for most part low, hilly tracts. Recently emerged from the Post-Pliocene sea, or cleared of their ice-sheet coverings, they preserve the very same features over immense stretches; and the few portions that rise above the general elevation have more the character of broad and gentle swellings than of mountain-chains. Of this class are the swampy plateaus of the Kola peninsula, gently sloping southwards to the lake-regions of Finland and north-west Russia; the Valdai table-lands, where all the great rivers of Russia take their rise; the broad and gently-sloping meridional belt of the Ural Mountains; and lastly, the Taimyr, Tunguska, and Verkhoyansk ridges in Siberia, which do not reach the snow-line, notwithstanding their sub-Arctic position. As to the picturesque Bureya mountains on the Amur, the forest-clothed Sikhota-alin on the Pacific, and the volcanic chains of Kamchatka, they belong to quite another orographical world; they are the border-ridges of the terraces by which the great plateau-belt descends to the depths of the Pacific Ocean.

Rivers.

It is owing to these leading orographical features—divined by Carl Ritter, but only within the present day revealed by geographical research—that so many of the great rivers of the old continent are comprised within the limits of the Russian empire. Taking rise on the plateau-belt, or in its Alpine outskirts, they flow first, like the upper Rhone and Rhine, along high longitudinal valleys formerly filled up with great lakes; next they find their way through the rocky walls; and finally they enter the lowlands, where they become navigable, and, describing great curves to avoid here and there the minor plateaus and hilly tracts, they bring into water-communication with one another places thousands of miles apart. The double river-systems of the Volga and Kama, the Obi and Irtysh, the Angara and Yenisei, the Lena and Vitim on the Arctic slope, the Amur and Sungari on the Pacific slope, are instances. They were the true channels of Russian colonization.

A broad depression,—the Aral-Caspian desert—has arisen where the plateau-belt has reached its greatest height and suddenly changes its direction from a north-western into a north-eastern one; this desert is now filled only to a small extent by the salt waters of the Caspian, Aral, and Balkash inland seas; but it bears unmistakable traces of having been during Post-Pliocene times an immense inland basin. There the Volga, the Ural, the Sir Daria, and the Oxus discharge their waters without reaching the ocean, but continue to bring life to the rapidly drying Transcaspian Steppes, or connect by their river network, as the Volga does, the most remote parts of European Russia.

The extension of colonization.

The above-described features of the physical geography of the empire explain the relative uniformity of this wide territory, in conjunction with the variety of physical features on its outskirts. They explain also the rapidity of the expansion of Slavonic colonization over these thinly peopled regions; and they also throw light upon the internal cohesion of the empire, which cannot fail to strike the traveller as he crosses this immense territory, and finds everywhere the same dominating race, the same features of life. In fact, in their advance from the basins of the Volkhoff and Dnieper to the foot of the Altai and Sayan Mountains, that is, along nearly a quarter of the earth's circumference, the Russian colonizers could always find the same physical conditions, the same forests and prairies as they had left at home, the same facilities for agriculture, only modified somewhat by minor topographical features. New conditions of climate and soil, and consequently new cultures and civilizations, the Russians met with, in their expansion towards the south and east, only beyond the

Caucasus, in the Aral-Caspian region, and in the basin of the Usuri on the Pacific coast. Favoured by these conditions, the Russians not only conquered northern Asia—they colonized it.

The total population of the Russian empire was stated at 102,000,000 by estimates made in 1878–82; but it is multiplying rapidly, and, as the surplus of births over deaths reaches nearly 1,250,000 every year, it must now be somewhat more than 106 millions.

Within the empire a very great diversity of nationalities is comprised, due to the amalgamation or absorption by the Slavonian race of a variety of Ural-Altaic stems, of Turco-Tartars, Turco-Mongolians, and various Caucasian stems. Statistics as to their relative strength are still very imperfect, and their ethnical relations have not as yet been completely determined; but, considered broadly, they may be classified as follows:—

A. The Letto-Slavonians comprise (a) the Lithuanians and Letts on the lower Niemen and Dvina, and (b) the Slavonians, that is, the Poles on the Vistula and Niemen and the Russians—Great, Little, and White—whose proper abodes are in European Russia, south of a line drawn from the Gulf of Finland to the middle Volga. Spreading from this region towards the north-east, east, and south-east, they have colonized north-east Russia, the Ural region, Caucasus, Siberia, and large parts of the Kirghiz Steppe,—the leading feature of their colonization having always been penetration in compact masses among the original inhabitants. Thus, on northern Caucasus the Russians (chiefly Little Russians) already constitute a compact rural population of nearly 1,500,000, that is, about a quarter of the total population of Caucasus. In Western Siberia the Great Russians already number more than 2,300,000 agriculturists, constituting four-fifths of the entire population; in Eastern Siberia they number more than 1,000,000, that is, probably more than the original inhabitants; and the Kirghiz Steppe has also begun rapidly to be colonized within the last twenty years. It is only in the more densely peopled Turkestan, and in the recently annexed Transcaspian region, that Russian settlers continue to bear but a small proportion to the natives (who are more than 4,600,000 strong). The Slavonians altogether number more than 75,000,000, of which number 5,600,000 are Poles.

Swedes (310,000), Germans (1,240,000), Roumanians, Serbs, &c., may number altogether about 2,500,000.

B. A great variety of populations belonging to the Caucasian race, but not yet well classified, some of which are considered to be remainders of formerly larger nationalities pushed aside into the mountain tracts during their migrations, are met with on Caucasus. Such are the Georgians, Ossetes, Lesghians, who fall little short of 2,500,000, and the Armenians, about 1,000,000.

C. The Iranian branch is represented by some 130,000 Persians and Kurds in Caucasus and Transcaucasia, and by Tajiks in Turkestan, mixed with Turco-Tartar Sarts. The nomad Tsigans, or Gipsies, numbering nearly 12,000, may be mentioned under this head.

D. The Semitic branch consists of upwards of 3,000,000 Jews in Poland, in west and south-west Russia, and on Caucasus and in the towns of Central Asia, and of a few thousand Karaite Jews.

E. The Ural-Altaic branch comprises two great subdivisions—the Finnish and the Turco-Tartarian stems, mixed to some extent with Mongolians. The former (see below) occupy, broadly speaking, a wide stretch of territory to the north of the Slavonians, from the Baltic to the Yenisei, and include the Baltic Finns, the Northern Finns, the Volga Finns, and the Ugrians. The Russians have already spread among the last two in compact masses,

4. The areas for the first three districts are given according to M. Seidlitz in *Russische Revue*, 1885, 4; for the remainder, according to General Meyer. The oasis of Merv proper extends to about 2100 square miles. The populations are given without the Russian military. M. Seidlitz estimates them as follows: 1. Badkhan, 100,000; 2. Gurgan, 100,000; 3. Merv, 160,000; Tadjen, 7500; total, 260,000. The total population, excluding military, is estimated by military authorities at 214,000.

Of the areas given in the table, the following (298,636 square miles) are occupied by internal waters (larger lakes and estuaries):—

European Russia.....	25,804 square miles.
Poland.....	141 "
Finland.....	18,471 "
Caucasus.....	1,628 "
Siberia.....	18,864 "
Turkestan.....	4,511 "
Kirghiz Steppes.....	14,888 "
Transcaspian region.....	455 "
Sea of Azoff, Caspian Sea, Lake Aral.....	218,874 "

The islands included in the above statement have the following areas (total 91,182 square miles):—

In the White Sea.....	191 square miles.
" Barents Sea.....	38,540 "
" Baltic Sea (Russian).....	1,579 "
" " (Finnish).....	2,000 "
" Black Sea.....	21 "
" Sea of Azoff.....	41 "
" Caspian Sea.....	551 "
" Siberian Arctic Ocean.....	16,496 "
" Pacific.....	81,763 "

Subdivisions of the empire.

The Russian empire falls into two great subdivisions, the European and the Asiatic, the latter of which, representing an aggregate of nearly 6,500,000 square miles, with a population of only 16 million inhabitants, may be considered as held by colonies. The European dominions comprise European Russia, Finland, which is in fact a separate nationality treated to some extent as an allied state, and Poland, whose very name has been erased from official documents, but which nevertheless continues to pursue its own development. The Asiatic dominions comprise the following great subdivisions:—CAUCASIA (*q.v.*), under a separate governor-general; the Transcaspian region, which is under the governor-general of Caucasus; the Kirghiz Steppes; TURKESTAN (*q.v.*), under separate governors-general; Western Siberia and Eastern Siberia (see SIBERIA); and the Amur region, which last comprises also the Pacific coast region and Kamchatka (see KAMCHATKA and MARITIME PROVINCE). The administrative subdivisions, with their populations, as estimated for 1882 for European Russia, Poland, and Caucasus, 1881 for Finland, and 1878–82 for the remainder (no regular census having been taken since 1858), are shown above in Table II.

Cities.

The empire contains only twelve cities with a population exceeding 100,000:—St Petersburg, 929,090 (1881); Moscow, 753,469 (1884); Warsaw, 406,260 (1882); Odessa, 217,000 (1882); Riga, 169,330 (1881); Kharkoff, 159,660 (1883); Kazan, 140,730 (1883); Kishineff, 130,000; Kieff, 127,250 (1874); Łódź, 113,146, in Poland (1884); Saratoff, 112,428 (1882); Tiflis, 104,020 (1883); and Ashkend, 100,000. According to the most recent returns Wilna, Orel, Rostoff, Astrakhan, Nikolaieff, Dünaburg, Tula, Samara, Taganrog, Kherson, Nijni-Novgorod, Berditcheff, Bobruisk, Zhitomir, Minsk, Vitebsk, Elisabetgrad, Reval, and Voronezh had from 94,000 to 50,000 inhabitants, while 61 towns more in European Russia, Finland, and Poland, and 20 in the Asiatic dominions, had from 50,000 to 20,000 inhabitants. The number of towns above 10,000 is considerable, but they are mostly mere administrative centres; many villages have greater importance.

Only 9,263,000 (or 9 per cent.) of the aggregate population of Russia inhabit towns, the number of which is 601 in the 50 Russian governments. The great number of the Russian towns are mere villages; their inhabitants depend on agriculture, and the houses are mostly built of wood, only 127,000 out of about 787,000 houses in towns being built of stone. Of the 68,600,000 who in 1882 formed the rural population of European Russia the greater part were settled in 555,278 villages, almost entirely built of wood; nearly one-seventieth of the houses are destroyed by fire yearly (164,400 out of 10,649,000 in 1882).

Government.

Russia is an absolute and strongly centralized monarchy. The primary unit of state organization is the village community, or *mir*. A number of such communities are united

into *volosts*, whose peasant inhabitants elect an elder (*volostnoy starshina*) and a peasants' tribunal (*volostnoy sud*). Placed, however, under the uncontrolled rule of a state official—the *mirovoy posrednik*—and of the police, the elder of the *volost* and his clerk have become mere organs of the local police and tax-gatherers, while the tribunal of the *volost* is at the mercy both of influential land-proprietors and of the wealthier peasants or merchants. The system of local self-government is continued in the elective district and provincial assemblies—the *zemstvo*—on the one hand, and on the other in the elective justices of the peace (*mirovoy sudia*), whose periodical gatherings (*mirovoy syezd*) are courts of appeal against the decisions of the individual justices. But neither of these institutions—and least of all the *zemstvo*—is capable of acquiring the necessary independence. The *zemstvos*—one for each district, and another for the province—consist of a representative assembly (*zemskoye sobraniye*) and an executive (*zemskaya uprava*) nominated by the former. The *sobraniye* consists of three classes of delegates:—the landed proprietors (all nobles possessing more than 590 acres, and delegates from the remainder, along with delegates from the clergy in their capacity of landed proprietors); representatives of the merchants, artisans, and urban population; and representatives of the peasants, indirectly elected,—matters being usually so adjusted that this class is less numerous than the aggregate of the other two. In theory the *zemstvos* have large powers in relation to the incidence of taxation, as well as in matters affecting education, public health, roads, &c. But in reality they are for the most part compelled to limit themselves to the adjustment of the state taxation, which is so high that new taxes for education, sanitary purposes, and so on, must necessarily be very limited. Moreover, the decisions of the *zemstvos* are jealously controlled by the representative of the central Government,—the governor,—and promptly annulled whenever they manifest a different spirit from that prevailing for the time at the court. Disobedience is punished by dissolution, sometimes by administrative exile. These circumstances have helped to eliminate from the *zemstvos* the better elements which at first entered into their composition. The greater number of them are inspired now with the same red-tapeism as the ministerial chancelleries, or are refuges for proprietors in search of a salary. Still, in several provinces a good deal of most useful work has been done, especially educational, by those *zemstvos* in which the peasants are in a majority or the proprietors are inspired with a more liberal spirit; while several other *zemstvos* have recently made extensive and most valuable inquiries into the condition of agriculture, industry, &c.

Since 1870 the municipalities have had institutions like those of the *zemstvos*. All owners of houses, and tax-paying merchants, artisans, and workmen, are enrolled on lists in a descending order according to their assessed wealth. The total valuation is then divided into three equal parts, each of which elects an equal number of representatives to the *duma*. The executive is in the hands of an elective mayor and an *uprava* which consists of several members elected by the *duma*. Both are, in fact, functionaries under the governor, and the municipal institutions have no real independent life.¹

The organs of the central government in the provinces are the *uryadniks* (a kind of *gardes-champêtres*) in the villages, the *stanovoy*s and *ispravniks* (chiefs of the police) in the districts, and the governors (a kind of Napoleonic prefect) in each government—all invested, the *uryadniks*

¹ See Golovatchoff, *Ten Years of Reforms in Russia; The Finances of the Zemstvos* (official publication); Dityatin, *Municipal Self-Government in Russia*, 2 vols.; and very numerous and valuable papers in the reviews *Vyestnik Evropy*, *Otchetsvennaya Zapiski*, *Russkaya Mysl*, &c.

included, with powers which are the more extensive as they are totally undefined. There is also in each government a special gendarmerie under the "chief of gendarmes," who usually is also the head of the "third section" of the Imperial Chancery. The name of the third section has been recently abolished, but the institution still continues. It has charge of the secret police of the state, and has most varied functions, such as the arrest of supposed political offenders, their exile to Siberia, the delivery of separation papers to spouses desiring divorce, and so on. Several governments are placed under special governors-general, whom the recent law on the "state of siege" invests with almost dictatorial powers.

The higher administration is represented by the emperor, who unites the supreme legislative, executive, and judicial powers, and is surrounded by four distinct councils—the committee of ministers, the council of the empire, the senate, and the Holy Synod. The ministers, who are considered as executing the will of the czar, and are nominated by him, are invested with very extensive powers; their circulars for the interpretation of laws have greater weight than the laws themselves. The council of the empire, which consisted in 1884 of 64 members, nominated by the emperor, besides the ministers and several members of the imperial family, is a consultative body for matters of legislation. The senate, also nominated by the emperor, has two distinct functions. Seven "departments" of it are administrative; they promulgate the laws, examine the acts of governors, adjudicate in their conflicts with zemstvos, and, in theory, can make remonstrances to the emperor,—in fact they merely register and promulgate laws. Two other "departments" are courts of cassation. A special department, reinforced by representatives of nobility, pronounces judgment in political cases. The Holy Synod, consisting of metropolitans and bishops who sit there in turn, has the superintendence of religious affairs.

Justice. The judicial system introduced in 1864 was conceived in a very liberal spirit, which, unfortunately, has not been maintained. Thus a "preliminary instruction," made by the "third section" in political cases, or by the police, has been subsequently introduced. The "judges of instruction," irremovable by law, have not yet been nominated, their functions being discharged by substitutes entirely dependent upon the ministry. Elective justices of the peace decide in all cases involving less than 500 roubles, or less than six months' imprisonment. Their decisions can be brought by appeal before the district gathering of the justices of the peace, and thence before the senate. All criminal cases involving severer penalties are tried by juries, whose verdicts can be set aside only by a court of cassation, but are not respected in cases having a so-called "political" aspect. Political offences are tried by tribunals composed *ad hoc*. Civil cases in which more than 500 roubles are involved are tried by courts of justice, with appeal to chambers of justice.

Crime. In 1879 in European Russia,—exclusive of six Lithuanian and White Russian governments,—42,530 persons were tried before the courts, and 59,600 before the justices of the peace, the convictions being respectively 27,397 and 36,742. The aggregate number of condemnations pronounced in 1882 was 46,018 in European Russia, that is, 5.9 condemned in each 10,000; only 4836 of them were women. On January 1, 1882, 93,108 persons were in jail; 530,307 men and 66,073 women (the latter with 30,769 children) were imprisoned during the year, while 625,280 prisoners were liberated or exiled, and on January 1, 1883, the number of prisoners in jail (excluding those of Saghalin and Caucasus) was 97,337. More than 20,000 are annually transported to Siberia.

Administrative divisions. The empire is divided for administrative purposes into governments (*guberniya*) or territories (*oblast*), of which there are 50 in European Russia and 10 in Poland. Each government, or territory, is divided into eight to fifteen districts (*uyezd*). The Asiatic dominions are divided into one lieutenantancy (*namyestnithestvo*), that of Caucasus, and four general governments—Turkestan, Stepnoye (Kirghiz Steppes), East Siberia, and Amur. They comprise thirty-three governments and territories, besides a few districts (*okrug*, *otdyel*) in Transcaucasia and the Transcaspian region, regarded almost as separate governments. In Siberia the governors and governors-general are assisted by councils which have a consultative voice. The Baltic provinces have some peculiar institutions. Finland is a separate state, having its own

finances, army, and representative institutions, with limited rights, but its ministers of war and the exterior are those of the empire, and its institutions are not always respected by the emperor.

The emperor is not the head of the church, all decisions in theological matters having to be given by the Synod. His influence, however, is very great, as the nomination of the bishops rests with him. In 1882 there were in Russia 40,569 Orthodox churches and about 14,000 chapels, with 37,318 priests, 7009 deacons, and 45,895 singers. There were also 6752 monks and 3957 aspirants, 4945 nuns and 13,803 female aspirants. The church budget was 18,974,887 roubles in 1884. The monasteries and churches are possessed of great wealth, including 2950 square miles of land (a territory greater than that of Oldenburg), an invested capital of 22,634,000 roubles, an annual subsidy of 408,000 roubles from Government, and a very great number of inns, shops, printing establishments, burial grounds, &c., with whole towns covering an aggregate area of 10½ square miles. Their total annual revenue is estimated at 9,000,000 roubles.

Much still remains to be done for the diffusion of the first elements of a sound education throughout the empire; unhappily the endeavours of private persons in this field and of the zemstvos are for political reasons discouraged by the Government. There are seven universities—Dorpat, Kazan, Kharkoff, Kieff, Moscow, Odessa, and St Petersburg—to which may be added those of Warsaw and Helsingfors. In 1883 the seven Russian universities had 605 professors and 10,528 students, and there were 81 professors and 1228 students at Warsaw. The standard of teaching on the whole is high, and may be compared to that of the German universities. The students are hardworking, and generally very intelligent. Mostly sons of poor parents, they live in extreme poverty, supporting themselves chiefly by translating and by tutorial work. Severe measures have been taken in 1885 in regard to the universities. Explicit regulations for the interpretation of science have been issued, and restrictions laid upon the teaching of philosophy and natural science generally; comparative legislation has been excluded from the programmes; teaching in Russian (instead of German) has been ordered at Dorpat. The students are placed under rigorous regulations in regard to their life outside the university. About 950 students in theological academies and 2500 in higher technical schools must be added to the above.

The state of secondary education still leaves very much to be desired. There were in 1883 180 gymnasiums and progymnasiums for boys in European Russia, and 24 in the Asiatic dominions, and 27 and 10 respectively for girls; there were also 73 "real" schools in European Russia and 8 in the Asiatic dominions, and 48 normal schools in Russia and 10 in the Asiatic dominions. To these must be added the 14,800 pupils in 53 theological seminaries, and about 3000 in various secondary schools. The steady tendency of Russian society towards increasing the number of secondary schools, where instruction would be based on the study of the natural sciences, is checked by Government in favour of the classical gymnasiums. The aggregate number of schools for secondary instruction in European Russia in 1882 was 456 for boys and 384 for girls, with 107,980 male and 79,625 female scholars. Of these, 355 schools (45,303 boys and 3199 girls) give professional education.

For primary instruction there were in 1882 in European Russia proper 28,329 schools, with 1,177,504 male and 362,471 female pupils. Of the 6,231,160 roubles expended on primary schools only 747,772 roubles were contributed by Government, the remainder being supplied by the zemstvos (2,512,113 roubles), by municipalities, or by private persons. Sunday schools and public lectures are virtually prohibited.

A characteristic feature of the intellectual movement in Russia is its tendency to extend to women the means of receiving higher instruction. The gymnasiums for girls are both numerous and good. In addition to these, notwithstanding Government opposition, a series of higher schools, where careful instruction in natural and social sciences is given, have been opened in the chief cities under the name of "Pedagogical Courses." At St Petersburg a women's medical academy, the examinations of which were even more searching than those of the ordinary academy (especially as regards diseases of women and children), was opened, but after about one hundred women had received the degree of M.D., it has been suppressed by Government. In several university towns there are also free teaching establishments for women, supported by subscription, with programmes and examinations equal to those of the universities. In 1882 the students numbered 914 at St Petersburg, about 500 at Moscow, and 389 at Kazan.

The natural sciences are much cultivated in Russia, especially during the last twenty years. Besides the Academy of Science, the societies, Moscow Society of Naturalists, the Mineralogical Society, the Geographical Society, with its Caucasian and Siberian branches, the archaeological societies and the scientific societies of the Baltic provinces, all of which are of old and recognized standing, there have lately sprung up a series of new societies in connexion with each university, and their serials are yearly growing in importance, as

also are those of the recently founded Moscow Society of Friends of Natural Science, the Chemico-Physical Society, and various medical, educational, and other societies. The work achieved by Russian savants, especially in biology, physiology, and chemistry, and in the sciences descriptive of the vast territory of Russia, are well known to Europe.

Finance. The finances of the empire are in a most unsatisfactory condition. Although the revenue has doubled since 1856, and had reached 697,980,983 roubles (£69,798,098)¹ in 1883, the expenditure, which was estimated at 721,337,844 roubles the same year, is always in excess of the income. The national debt is rapidly augmented both by loans and by issues of paper money so depreciated as to be worth only about 60 to 63 per cent. of its nominal value. On January 1, 1884, no less than 1,085,000,000 paper roubles were in circulation; and the national debt, the paper-money included, reached about £578,000,000, inclusive of the railway debt. The great defect of Russian finance is that its direct taxes are chiefly paid by the peasantry (91 per cent. of the whole), and the revenue is chiefly based on excise duties (direct taxes, 136,105,320 roubles; excise duties on spirits, 250,291,330; duties on tobacco and sugar, 28,569,500; import duties, 101,053,000). Of the yearly revenue no less than 436,000,000 roubles are spent in interest and sinking fund on the debt, and for war purposes.²

The zemstvos, which have an aggregate yearly income of about thirty million roubles, have also a yearly deficit of from three to five million roubles. The municipalities had in 1882 an income of only 40,076,748 roubles, there being only nine cities which had a budget of more than 500,000 roubles, and five above one million.

Army. The Russian army has been completely reorganized since the Crimean War, and compulsory military service was introduced in 1874. In 1884 the strength of the army on a peace footing was 532,764 men serving with the colours, 68,786 reserve troops, 55,599 Cossacks and irregulars, 72,626 local, dépôt, and instruction troops, 27,468 officers, 129,736 horses, and 1844 guns. On a war footing there were 986,000 in the active army, 563,373 in the reserve, 148,057 Cossacks and irregulars, 178,450 local, dépôt, and instruction troops, 41,551 officers, 366,354 horses, and 3778 guns; that is, about 1,300,000 men in field, to which number 1,000,000 untrained militia could be added in case of need. These high figures, ought, however, to be much reduced on account of the deficiencies of mobilization.

The irregular troops consist of ten *voiskos*—Don, Kuban, Terek, Astrakhan, Orenburg, Ural, West Siberia, Semirychensk, Transbaikalia, and Amur. All the men of these voiskos between sixteen and forty-one years of age are bound to be ready for service in turn in time of peace, and to equip themselves at their own expense, train and artillery being provided by Government. In their twofold capacity as peasant settlers and a military force, these men have contributed much to the conquest of Asia.

Since 1878 compulsory military service has been introduced in Finland. The Finnish troops (nine battalions of 4833 riflemen) must be employed, as a rule, for the defence of their own country.

Navy. Notwithstanding large recent outlays, the Russian navy is by no means adapted to the exigencies of modern warfare; much stress is therefore laid on the good organization of the torpedo flotilla. The navy consists of 358 vessels, of 196,575 tons, carrying 24,500 men and 671 guns. Only 40 of these are armoured ships, the remainder being unarmoured frigates, corvettes, and cruisers, or torpedo boats (119), while a great number are mere transports and small craft.

Fortresses. The extensive frontier is defended by many fortresses, chiefly on the west. Poland to the west of the Vistula remains quite unprotected, fortifications being only now in course of construction in the south-west; but the Vistula is defended by the first-class fortresses of Modlin (Novogeorgievsk), Warsaw, and Ivangorod, with Brest-Litovsk in the rear. For protecting this line in rear new fortifications are being erected. The space between Poland and the Duna is protected only by the citadel of Vilna and the marshes of the Pripiet. The second line of fortresses has been erected on the Duna and Dnieper,—Riga, Dünauburg, Vitebsk, Bobruisk, and Kieff. The south-western frontier is under the protection of the advanced works of Bendery and Akerman, while the Black Sea coast is defended by Kinburn and Otchakoff at the entrances of the Dnieper and the Bug, Sebastopol in the Crimea, batteries at Odessa and Nikolaieff, and a series of minor fortifications. Formidable defensive works have been erected on the Baltic at Dünamünde, Reval, Narva, Cronstadt, Wiborg, Frederikshamn, Rohtensalm, Sveaborg, Hangöudd, and in the Åland Islands. A great number of minor forts are scattered throughout Caucasia, Transcaucasia, and Turkestan; but the Pacific coast has only earth-works at Vladivostok and Nikolaievsk.

¹ Unless metallic or silver roubles are expressly mentioned, the rouble is to be taken throughout the present article as the paper rouble, the recent average value of which has been 2s. sterling. The metallic rouble (277·71 grains of pure silver) is equivalent to 38·046 pence sterling; but the paper rouble has gradually declined from 94·5 per cent. of its nominal value in 1861-65 to 60 per cent. in 1882 (see below, p. 86).

PART II.—EUROPEAN RUSSIA—GEOGRAPHY.

The administrative boundaries of European Russia, apart from Bound Finland and Poland, broadly coincide on the whole with the aries.

The administrative boundaries of European Russia, apart from Bound Finland and Poland, broadly coincide on the whole with the aries. The natural limits of the East-European plains, where they suddenly take, eastward of the Baltic Sea, a great extension towards the north. In the north it is bounded by the Arctic Ocean; the islands of Nova Zembla, Kolgueff, and Vaigatch also belong to it, but the Kara Sea is reckoned to Siberia. To the east it has the Asiatic dominions of the empire, Siberia and the Kirghiz Steppe, from both of which it is separated by the Ural Mountains, the Ural river, and the Caspian—the administrative boundary, however, partly extending into Asia on the Siberian slope of the Urals. To the south it has the Black Sea and Caucasia, being separated from the latter by the double valley of the two Manytches—a channel which in Post-Pliocene times connected the Sea of Azoff with the Caspian. The western boundary is purely conventional: it crosses first the peninsula of Kola from the Varanger Fiord to the northern extremity of the Gulf of Bothnia, making an arbitrary deflexion towards the west; thence it runs to the Kurische Haff in the southern Baltic, and thence to the mouth of the Danube, taking a great circular sweep to the west to embrace Poland, and separating Russia from Prussia, Austrian Galicia, and Roumania.

Of this immense frontier line less than one-half is bordered by seas—nearly all of them inland seas. For it is a special feature of Russia—a feature which has impressed a special character on its history—that she has no free outlet to the high seas except on the ice-bound shores of the Arctic Ocean. Even the White Sea is merely a ramified gulf of that ocean. Another warmer gulf of the Arctic Ocean—the Varanger Fiord—separated from Russia by the uninhabitable plateaus of the peninsula of Kola, has been abandoned to Norway. The deep indentations of the Gulf of Bothnia and Finland wash the shores of Finnish territory, and it is only at the very head of the latter gulf that the Russians happen to have taken a firm foothold by erecting their capital on the marshes at the mouth of the Neva. The Gulf of Riga and the south-eastern Baltic belong also to territory which is not inhabited by Slavonians, but by Finnish stems, and by Germans. It is only very recently, within the last hundred years, that the Russians definitively took possession of the northern shores of the Black Sea and the Sea of Azoff. The eastern coast of the Black Sea belongs properly to Transcaucasia, a great chain of mountains separating it from Russia. But even this sea is an inland one, the only outlet of which, the Bosphorus, is in foreign hands, while the Caspian is but an immense shallow lake, bordered mostly by deserts, and possessing more importance as a link between Russia and her colonies than as a channel for intercourse with other countries.

The great territory occupied by European Russia—1600 miles in Configuration from north to south, and nearly as much from west to east ration.

—is on the whole a broad elevated plain, ranging between 500 and 900 feet above sea-level, deeply cut into by river-valleys, and bounded on all sides by broad hilly swellings or mountains:—the lake plateaus of Finland and the Maanselka heights in the north-west; the Baltic coast-ridge and spurs of the Carpathians in the west, with a broad depression between the two, occupied by Poland; the Crimean and Caucasian mountains in the south; and the broad but moderately high swelling of the Ural Mountains in the east.

From a central plateau which comprises Tver, Moscow, Smolensk, and Kursk, and projects eastwards towards Samara, attaining an average height of 800 to 900 feet above the sea, the surface gently slopes in all directions to a level of from 300 to 500 feet. Then it again gently rises as it approaches the hilly tracts enclosing the great plain. This central swelling may be considered a continuation towards the east-north-east of the great line of upheavals of western Europe; the heights of Finland would then appear as continuations of the Scanian plateaus, and the northern mountains of Finland as continuations of the Kjölen, while the other great line of upheaval of the old continent, which runs north-west and south-east, would be represented in Russia by the Caucasus in the south and the Timan ridge of the Petchora basin in the north.

The hilly aspects of several parts of the central plateau are not due to foldings of the strata, which for the most part appear to be horizontal, but chiefly to the excavating action of rivers, whose valleys are deeply dug out in the plateau, especially on its borders. The round flattened summits of the Valdai plateau do not rise above 1100 feet, and they present the appearance of mountains only in consequence of the depth of the valleys—the levels of the rivers which flow towards the depression of Lake Peipus being only from 200 to 250 feet above the sea. The case is similar with the plateaus of Livonia, “Wendish Switzerland,” and Kovno, which do not exceed 1000 feet at their highest points; so also with the eastern spurs of the Baltic coast-ridge between Grodno and Minsk. The same elevation is reached by a very few flat summits of the plateau about Kursk, and farther east on the Volga about Kamyshin, where the valleys are excavated in the plateau to a depth of from 800 to 900 feet, giving quite a hilly aspect to the country. It is only in the south-west, where spurs

of the Carpathians enter Volhynia, Podolia, and Bessarabia, that ridges reaching 1100 feet are met with, intersected by deep ravines.

The depressions on the borders of the central plateau thus acquire a greater importance than the small differences in its height. Such is the broad depression of the middle Volga and lower Kama, bounded on the north by the faint swelling of the Uvati, which is the watershed between the Arctic Ocean and the Volga basin. Another broad depression, from 250 to 500 feet above the sea, still filled by Lakes Peipus, Ladoga, Onega, Bielo-ozero, Łatche, Vozhe, and many thousands of smaller ones, borders the central plateau on the north, and follows the same east-north-east direction. Only a few low swellings penetrate into it from the north-west, about Lake Onega, and reach 900 feet, while in the north-east it is enclosed by the high Timanskiy ridge (1000 feet). A third depression of a similar character, occupied by the Pripet and the middle Dnieper, extends to the west of the central plateau of Russia, and penetrates into Poland. The immense lacustrine basin is now broken up into numberless ponds, lakes, and extensive marshes (see MINSK). It is bounded on the south by the broad plateaus spreading east of the Carpathians. South of 50° N. lat. the central plateau gently slopes towards the south, and we find there a fourth depression spreading west and east through Poltava and Kharkoff, but still reaching in its higher parts 500 to 700 feet. It is separated from the Black Sea by a gentle swelling which may be traced from Kremenetz to the lower Don, and perhaps farther south-east. This low swelling includes the Donetz coal-measures and the middle granitic ridges which cause the rapids of the Dnieper. Finally a fifth immense depression, which descends below the level of the ocean, extends for more than 200 miles to the north of the Caspian, comprising the lower Volga and the Ural and Emba rivers, and establishing a link between Russia and the Aral-Caspian region. The depression is continued farther north by plains below 300 feet which join the depression of the middle Volga, and extend as far as the mouth of the Oka.

The Ural Mountains present the aspect of a broad swelling whose strata no longer exhibit the horizontality we see in Russia, and moreover are deeply cut into by rivers. It is connected in the west with broad plateaus joining those of central Russia, but its orographical relations to other upheavals must be more closely studied before they can be definitely pronounced on.

The rhomboidal peninsula of the Crimea, connected by only a narrow isthmus with the continent, is occupied by a dry plateau gently sloping north and east, and bordered in the south-east by the Yaita Mountains, the summits of which range between 4000 and 5113 feet (see CRIMEA and TAURIDA).

Rivers.

Owing to the orographical structure of the East-European plains, which has just been described, the river-system has attained a very high development. Taking their origin from a series of great lacustrine basins scattered over the surface of the plateaus and differing slightly in elevation, the Russian rivers describe immense curves before reaching the sea, and flow with a very gentle gradient, receiving numerous large tributaries, which collect their waters from vast areas. Thus the Volga, the Dnieper, and the Don attain respectively a length of 2110, 1330, and 1125 miles, and their basins cover 645,000, 244,600, and about 115,000 square miles respectively. Moreover the chief rivers of Russia—the Volga, the Dina, the Dnieper, and even the Łovat and the Oka—take their rise in the north-western part of the central plateau, so close to one another that they may be said to radiate from the same marshes. The sources of the Don are ramified among the tributaries of the Oka, while the upper tributaries of the Kama join those of the Dwina and Petchora. In consequence of this, the rivers of Russia have been from remote antiquity the true channels of trade and migration, and have contributed much more to the elaboration of the national unity than any political institutions. Boats could be conveyed over flat and easy portages, from one river-basin to another, and these portages were subsequently transformed with a relatively small amount of labour into navigable canals, and even at the present day these canals have more importance for the traffic of the country than most railways. By their means the plains of the central plateau—the very heart of Russia, whose natural outlet was the Caspian—were brought into water-communication with the Baltic, and the Volga basin connected with the Gulf of Finland. The White Sea has also been brought into connexion with the central Volga basin, while the sister-river of the Volga—the Kama—became the main artery of communication with Siberia.

It must be observed, however, that, though ranking before the rivers of western Europe in respect of length, the rivers of Russia are far behind as regards the amount of water discharged. They freeze in winter and dry up in summer, and most of them are navigable only during the spring-floods; even the great Volga becomes so shallow during the hot season that only light boats can pass its shoals.

Russia has a very large number of lakes. The aggregate area of the largest ones is stated at 25,800 square miles.

The following is a descriptive list of the principal rivers of European Russia.

A. Arctic Ocean Basin.—(1) The Petchora (1025 miles) rises in the

northern Urals, and enters the ocean by a large estuary at the Gulf of Petchora. Its basin, thinly peopled and available only for cattle-breeding and for hunting, is quite isolated from Russia by the Timan ridge. The river is navigable for 770 miles; grain and a variety of goods conveyed from the upper Kama are floated down, while furs, fish, and other products of the sea are shipped up the river to be transported to Tcherdyn on the Kama. (2) The Kara (139 miles) enters the Kara Sea. (3) The Mezeň (510 miles) enters the Bay of Mezeň; it is navigable for 450 miles, and is the channel of a considerable export of timber. (4) The northern Dwina, or Dwina (950 miles), with a basin of about 150,000 square miles, is formed by the union of two great rivers, the Yug (270 miles) and the Sukhona (330 miles). The Sukhona has its origin in Lake Kubenskoye, in north-west Vologda, and flows rapidly southwards and eastwards, having a great number of rapids. It is navigable throughout its length, and, as Lake Kubenskoye communicates by the Alexander of Würtemberg Canal with Lake Bieloje, it is connected with the Caspian and Baltic. The Vytchegda (685 miles), which flows west-south-west to join the Sukhona, through a woody region, thinly peopled, is navigable for 500 miles and in its upper portion is connected by a canal with the upper Kama. The Dwina flows with a very slight gradient through a broad valley, receiving many tributaries, and reaches the White Sea at Archangel by a number of branches. Notwithstanding serious obstacles offered by shallows, corn, fish, salt, and timber are largely shipped to and from Archangel. (5) The Onega (245 miles) rises in Lake Łatche in the south of Łonetz, and flows into Onega Bay; it has rapids; timber is floated down in spring, and fishing and some navigation are carried on in the lower portion.

B. Baltic Basin.—(6) The Neva (46 miles) flows from Lake Ładoga into the Gulf of Finland (see ST PETERSBURG). (7) The Volkhoff (135 miles), discharging into Lake Ładoga (see ŁADOGA), and forming part of the Vyshnevolotsk system of canals, is an important channel for navigation; it flows from Lake Ilmen (367 square miles), which receives the Msta (250 miles), connected with the Volga, the Łovat (310 miles), and many smaller tributaries. (8) The Svir (135 miles), also discharging into Lake Ładoga, flows from Lake Onega (4925 square miles), and, being part of the Marinsk canal system, is of great importance for navigation (see VOLGA). (9) The Narova (46 miles) flows out of Lake Peipus into the Gulf of Finland at Narva; it has remarkable rapids, notwithstanding which an active navigation is carried on by means of its waters. Lake Peipus, or Tchudskoye (136 square miles), receives—(10) the Velikaya (210 miles), a channel of traffic with southern Russia from a remote antiquity, but now navigable only in its lower portion, and (11) the Embach (83 miles), navigated by steamers to Dorpat. (12) The Dina, or West Dwina (577 miles), with a basin area of about 75,000 square miles, rises in the Ostashkoff district of Tver, and falls into the sea below Riga, after having described a great curve to the south. It is shallow above the rapids of Jacobstadt, but navigation is carried on as far as Vitebsk,—corn, timber for shipbuilding, potash, flax, &c., being the principal shipments of its navigable tributaries (the Obsha, Ulla, and Kasplya); the Ulla is connected by the Berezhina canals with the Dnieper. (13) The Niemen (Memel), with a course of 470 miles in Russia, rises in the north of Minsk, leaves Russia at Yurburg, and enters the Kurische Haff; rafts are floated upon it almost from its sources, and steamers ply as far as Kovno; the export of corn and timber to Prussia, and import of fish, grocery, and manufactured ware are considerable; it is connected by the Oginski Canal with the Dnieper. The chief tributaries are the Viliya and the Shara. For (14) the Vistula, with the Bug and Narew, see POLAND.

C. Black Sea Basin.—(15) The Pruth (505 miles) rises in Austrian Bukovina, and separates Russia from Roumania; it enters (16) the Danube, which flows along the Russian frontier for 100 miles below Reni, touching it with its Kilia branch. (17) The Dniester (530 miles within Russia and about 330 miles in Austria) rises in Galicia. Light boats and rafts are floated at all points, and steamers ply on its lower portion; its estuary has important fisheries. (18) The Dnieper (1330 miles), with a basin of about 245,000 square miles, with tributaries, waters thirteen governments, of which the aggregate population numbers about 15,000,000. It also originates in the north-western parts of the central plateau, in the same marshy lakes which give rise to the Volga and Dina. It flows west, south, south-east, and south-west, and enters a bay in the north-western part of the Black Sea. In the middle navigable part of its course, from Dorogobuzh to Ekaterinoslaff, it is an active channel for traffic. It receives several large tributaries:—on the right, the Berezhina (285 miles), connected with the Dina, and the Pripet (400 miles), both most important for navigation,—as well as several smaller tributaries on which rafts are floated; on the left the Sozh (330 miles), the Desna (590 miles), one of the most important rivers of Russia, navigated by steamers as far as Bryansk, the Suła (252 miles), the Psiot (415 miles), and the Vorska (268 miles). Below Ekaterinoslaff the Dnieper flows for 46 miles through a series of thirteen rapids. At Kherson it enters its long (40 miles) but

shallow estuary, which receives the West Bug (450 miles) and the Ingul (220 miles). The traffic of the Dnieper and its tributaries reached in 1882 an aggregate of 12.9 million cwts. shipped and 6.7 discharged, the principal items being corn, salt, and timber. (19) The Don (1125 miles), with a basin of about 120,000 square miles, and navigable for 880 miles, rises in south-eastern Tula and enters the Sea of Azoff at Rostoff by thirty mouths, after describing a great curve to the east at Tsaritsyn, approaching the Volga, with which it is connected by a railway (40 miles). Its navigation is of great importance (5.4 million cwts. shipped, and 5.1 discharged), especially for goods brought from the Volga, and its fisheries are extensive. The chief tributaries are the Sosna (175 miles) and North Donetz (615 miles) on the right, and the Voronezh (305 miles), Khoper (565 miles), Medveditsa (410 miles), and Manytch (295 miles), on the left. (20) The Yliya (192 miles), (21) the Kubañ (510 miles), and (22) the Rion belong to Caucasia.

D. *The Caspian Basin.*—(23) The Volga, the chief river of Russia, has a length of 2110 miles, and its basin, about 648,000 square miles in area, contains a population of more than 40,000,000. It is connected with the Baltic by three systems of canals (see VOLGA). (24) The Great and the Little Uzeñ no longer reach the Caspian but lose themselves in the Babinskoye Lakes. (25) The Ural (1475 miles), in its lower part, constitutes the frontier between European Russia and the Kirghiz Steppe; it receives the Sakmara on the right and the Ilel on the left. (26) The East Manytch (175 miles) is on the Caucasian boundary. (27) The Kuma (405 miles), (28) the Terek (360 miles), and (29) the Kura (about 650 miles), with the Arax (about 650 miles), which receives the waters of Lake Goktcha, belong to Caucasia.¹

Geology.

Almost every geological formation, from the oldest up to the most recent, is met with in Russia; but, as they are almost horizontal, they for the most part cover one another over immense spaces, so that the lower ones appear only at the bottom of the deeper valleys, and the oldest are seen only on the borders of the great Russian plain.

At the beginning of the Palæozoic period only a very few portions of what is now Russia—Finland, namely, and parts of Olonetz—rose above the surface of the sea; but, as the result of a gradual upheaval continued through Palæozoic times, it is supposed that at the end of this epoch Russia was a continent not greatly differing from the present one. In Mesozoic times the sea began again to invade it, but, while in the preceding period the oscillations resolved themselves into a gradual upheaval extending from west to east, in Mesozoic times the upheaval went on from north-west to south-east. The Mesozoic sea, however, did not extend beyond what is now central Russia, and did not cover the "Devonian plateau" of western Russia, which remained a continent from the Carboniferous epoch. A gradual rising of the continent followed, and was continued through Neozoic times, with perhaps a limited subsidence in the Post-Glacial period, when the actual seas extended their narrow gulfs up the valleys now occupied by the great rivers. During the first part of the Glacial period, Russia seems to have been covered by an immense ice-sheet, which extended also over central Germany, and of which the eastern limits cannot yet be determined.

The Archæan gneisses have a broad extension in Finland, northern Russia, the Ural Mountains, and the Caucasus; they form also the back-bone of the ridge which extends from the Carpathians through southern Russia. They consist for the most part of red and grey gneisses and granulites, with subordinate layers of granite and granitite. The Finland *rappakivi*, the Serdobol gneiss, and the Pargas and Rustiala marble (with the so-called *Eozoön canadense*) yield good building stone; while iron, copper, and zinc-ore are common in Finland and in the Urals. Rocks regarded as representing the Huronian system appear also in Finland, in north-western Russia, as a narrow strip on the Urals, and in the Dnieper ridge. They consist of a series of unfossiliferous crystalline slates. The Cambrian is represented by blue clays, unglutite sandstones, and bituminous slates in Esthonia and St Petersburg.

The Silurian system is widely developed, and it is most probable that, with the exception of the Archæan continents of Finland and the Urals, the Silurian sea covered the whole of Russia. Being concealed by more recent deposits, Silurian rocks appear on the surface

only in north-western Russia (Esthonia, Livonia, St Petersburg, and on the Volkhoff), where all European subdivisions of the system have been found, in the Timan ridge, on the western slope of the Urals, in the Pai-kho ridge, and in the islands of the Arctic Ocean. In Poland it is met with in the Kielce mountains, and in Podolia in the deeper ravines.

The Devonian dolomites, limestones, and red sandstones cover immense tracts and appear on the surface over a much wider area. From Esthonia these rocks extend north-east to Lake Onega, and south-east to Moghileff; they form the central plateau, as also the slopes of the Urals and the Petchora region. In north-western and middle Russia they contain a special fauna, and it appears that the Lower Devonian series of western Europe, represented in Poland and in the Urals, is missing in north-western and central Russia, where only the Middle and Upper Devonian divisions are found.

Carboniferous deposits cover nearly all eastern Russia, their west boundary being a line drawn from Archangel to the upper Dnieper, thence to the upper Don, and south to the mouth of the last-named river, with a long narrow gulf extending west to encircle the plateau of the Donetz. They are visible, however, only on the western borders of this region, being covered towards the east by thick Permian and Triassic strata. Russia has three large coal-bearing regions—the Moscow basin, the Donetz region, and the Urals. In the Valdai plateau there are only a few beds of mediocre coal. In the Moscow basin, which was a broad gulf of the Carboniferous sea, coal appears as isolated inconstant seams amidst littoral deposits, the formation of which was favoured by frequent minor subsidences of the sea-coast. The Donetz coal-measures, containing abundant remains of a rich land-flora, cover nearly 16,000 square miles, and comprise a valuable stock of excellent anthracite and coal, together with iron-mines. Several smaller coal-fields on the slopes of the Urals and on the Timan ridge may be added to the above. The Polish coal-fields belong to another Carboniferous area of deposit, which extended over Silesia.

The Permian limestones and marls occupy a strip in eastern Russia of much less extent than that assigned to them on geological maps a few years ago. The variegated marls of eastern Russia, rich in salt-springs, but very poor in fossils, are now held by most Russian geologists to be Triassic. Indisputably Triassic deposits have been found only in the two Bogdo mountains in the Kirghiz Steppe (*Campiler-Schichten*) and in south-western Poland.

During the Jurassic period the sea began again to invade Russia from south-east and north-west. The limits of the Russian Jurassic system may be represented by a line drawn from the double valley of the Sukhona and Vytchegda to that of the upper Volga, and thence to Kieff, with a wide gulf penetrating towards the north-west. Within this space three depressions, all running south-west to north-east, are filled up with Upper Jurassic deposits. They are much denuded in the higher parts of this region, and appear but as isolated islands in central Russia. In the south-east all the older subdivisions are represented, the deposits having the characters of a deep-sea deposit in the Aral-Caspian region and on the Caucasus.

The Cretaceous deposits—sands, loose sandstones, marls, and white chalk—cover the region south of a line drawn from the Niemen to the upper Oka and Don, and thence north-east to Simbirsk, with the exception of the Dnieper and Don ridge, the Yaila Mountains, and the upper Caucasus. They are rich in grinding stone, and especially in secondary layers of phosphorites.

The Tertiary formations occupy large areas in southern Russia. The Eocene covers wide tracts from Lithuania to Tsaritsyn, and is represented in the Crimea and Caucasus by thick deposits belonging to the same ocean, which left its deposits on the Alps and the Himalayas. Oligocene, quite similar to that of North Germany, and containing brown coal and amber, has been met with only in Poland, Courland, and Lithuania. The Miocene (Sarmatian stage) occupies extensive tracts in southern Russia, south of a line drawn through Lublin to Ekaterinoslaff and Saratoff. Not only the higher chains of Caucasus and Yaila, but also the Donetz ridge, rose above the level of the Miocene sea, which was very shallow to the north of this last ridge, while farther south it was connected both with the Vienna basin and with the Aral-Caspian. The Pliocene appears only in the coast region of the Black and Azoff Seas, but it is widely developed in the Aral-Caspian region, where, however, the Ust-Urt and the Obshchii Syrt rose above the sea.

The thick Quaternary, or Post-Pliocene, deposits which cover nearly all Russia were for a long time a puzzle to geologists. They consist of a boulder clay in the north and of loess in the south. The former presents an intimate mixture of boulders brought from Finland and Olonetz (with an addition of local boulders) with small gravel, coarse sand, and the finest glacial mud,—the whole bearing no trace of ever having been washed up and sorted by water in motion, except in subordinate layers of glacial sand and gravel; the size of the boulders decreases on the whole from north to south, and the boulder clay, especially in northern and central Russia, often takes the shape of ridges parallel to the direction of the

¹ *Bibliography.*—The lengths of the rivers of European Russia as ascertained by accurate measurements are given by Tillo, in *Izvestia of Geogr. Soc.*, 1883. See also S. uckenberg, *Izdr. des R. Reichs*; Semenov, *Geogr. Statist. Dictionnaire* (the most reliable source for all the geography of Russia). Strelitzky, *Superficies de l'Europe*; H. Wagner, "Studien im Geb. d. Areal-statistik," in the *Stat. Monatschrift*, viii.; official *Stat. Materialoff*, with regard to Russian rivers, 1876; Statistical *Sbornik* of the Min. of Communications, vol. x. (freezing of Russian rivers, and navigation). Besides the military statistical descriptions of separate governments, a great variety of monographs dealing with separate rivers and basins are also available; e.g., Sidoroff, *The Petchora Region, and North Russia*; Helmersen, *Olonetz Bergrevier*; Turbin, *The Dnieper*; Frasenlo, "The Dniester," in *Engin. Journ.*, 1881; Danilevsky, "Kubañ," in *Mem. Geogr. Soc.*, i.; Baer, *Caspische Studien*; Ragozin, *Volga*; Peretyakovich, *Volga*; Mikhailoff, *Kama*; &c. An oro-hydrographical map of Russia in four sheets was published in 1878; see also Tillo, *Orogr. Map of Russia*; the ordnance maps of Russia; and Tillo, "Magnetical Maps of Russia," in *Izv. of Geogr. Soc.*, 1884 and 1885.

motion of the boulders. Its southern limits, roughly corresponding with those established by Murchison, but not yet settled in the south-east and east, are, according to M. Nikitin, the following:—from the southern frontier of Poland to Ovrutch, Umañ, Kremenchug, Pottava, and Razdornaya (50° N. latitude), with a curve northwards to Kozelsk (?); thence due north to Vetluga (58° north latitude), east to Glazova in Vyatka, and from this place towards the north and west along the watershed of the Volga and Petchora (?). South of the 50th parallel appears the loess, with all its usual characters (land fossils, want of stratification, &c.), showing a remarkable uniformity of composition over very large surfaces; it covers both watersheds and valleys, but chiefly the former. Such being the characters of the Quaternary deposits in Russia, the majority of Russian geologists now adopt the opinion that Russia was covered, as far as the above limits, with an immense ice-sheet which crept over central Russia and central Germany from Scandinavia and north Russia. Another ice-covering was probably advancing at the same time from the north-east, that is, from the northern part of the Urals, but the question as to the glaciation of the Urals still remains open. As to the loess, the view is more and more gaining ground which considers it as a steppe-deposit due to the drifting of fine sand and dust during a dry episode in the Pleistocene period.

The deposits of the Post-Glacial period are represented throughout Russia, Poland, and Finland, as also throughout Siberia and central Asia, by very thick lacustrine deposits, which show that, after the melting of the ice-sheet, the country was covered with immense lakes, connected by broad channels (the *fjärden* of the Swedes), which later on gave rise to the actual rivers. On the outskirts of the lacustrine region, closely resembling the area of the actual continent, traces of marine deposits, not higher than 200 or perhaps even 150 feet above present sea-level, are found alike on the Arctic Sea and on the Baltic and Black Sea coasts. A deep gulf of the Arctic Sea advanced up the valley of the Dwina; and the Caspian, connected by the Manytch with the Black Sea, and by the Uzböy valley with Lake Aral, penetrated north up the Volga valley, as far as its Samara bend. Unmistakable traces show that, while during the Glacial period Russia had an arctic flora and fauna, the climate of the Lacustrine period was more genial than it is now, and a dense human population at that time peopled the shores of the numberless lakes.

The Lacustrine period has not yet reached its close in Russia. Finland and the north-west hilly plateaus are still in the same geological phase, and are dotted with numberless lakes and ponds, while the rivers continue to dig out their yet undetermined channels. But the great lakes which covered the country during the Lacustrine period have disappeared, leaving behind them immense marshes like those of the Pripet and in the north-east. The disappearance of what still remains of them is accelerated not only by the general decrease of moisture, but also by the gradual upheaval of northern Russia, which is going on from Esthonia and Finland to the Kola peninsula and Nova Zembla, at an average rate of about two feet per century. This upheaval,—the consequences of which have been felt even within the historic period, by the drainage of the formerly impracticable marshes of Novgorod and at the head of the Gulf of Finland,—together with the destruction of forests, which must be considered, however, as a quite secondary and subordinate cause, contributes towards a decrease of precipitation over Russia and towards increased shallowness of her rivers. At the same time, as the gradients of the rivers are gradually increasing on account of the upheaval of the continent, the rivers dig their channels deeper and deeper. Consequently central and especially southern Russia witness the formation of numerous miniature cañons, or *ovraghi* (deep ravines), the summits of which rapidly advance and ramify in the loose surface deposits. As for the southern steppes, their desiccation, the consequence of the above causes, is in rapid progress.¹

Soil.

The soil of Russia depends chiefly on the distribution of the boulder-clay and loess coverings described above, on the progress made by the rivers in the excavation of their valleys, and on the moistness of climate. Vast areas in Russia are quite unfit for cultivation, 27 per cent. of the aggregate surface of European Russia (apart from Poland and Finland) being occupied by lakes, marshes, sands, &c., 38 per cent. by forests, 14 per cent. by prairies, and only 21 per cent. being under culture. The distribution of all these is, however, very unequal, and the five following subdivisions may be established:—(1) the *tundras*; (2) the forest region; (3) the middle region, comprising the surface available for agriculture and partly covered with forests; (4) the black-earth (*chernoziom*) region; and (5) the Steppes. Of these the black-earth region,—about 150,000,000 acres,—which reaches from the Carpathians to the Urals, extending to the Pinsk marshes and

the upper Oka in the north, is the most important. It is covered with a thick sheet of black earth, a kind of loess, mixed with 5 to 15 per cent. of humus, due to the decomposition of an herbaceous vegetation, which developed richly during the Lacustrine period on a continent relatively dry even at that epoch. On the three-fields system corn has been grown upon it for fifty to seventy consecutive years without manure. Isolated black-earth islands, less fertile of course, occur also in Courland and Kovno, in the Oka, Volga, and Kama depression, on the slopes of the Urals, and in a few patches in the north. Towards the Black Sea coast its thickness diminishes, and it disappears in the valleys. In the extensive region covered with boulder-clay the black earth appears only in isolated places, and the soil consists for the most part of a sandy clay, containing a much smaller admixture of humus. There culture is possible only with the aid of a considerable quantity of manure. Drainage finding no outlet through the thick clay covering, the soil of the forest region is often covered with extensive marshes, and the forests themselves are often mere thickets spreading over marshy ground; large tracts covered with sand appear in the west, and the admixture of boulders with the clay in the north-west renders agriculture increasingly difficult. On the Arctic coast the forests disappear, giving place to the tundras. Finally, in the south-east, towards the Caspian, on the slopes of the southern Urals and the Obshchii Syrt, as also in the interior of the Crimea, and in several parts of Bessarabia, there are large tracts of real desert, covered with coarse sand and devoid of vegetation.²

Notwithstanding the fact that Russia extends from north to south through 26 degrees of latitude, the climate of its different portions, apart from the Crimea and the Caucasus, presents a striking uniformity. The aerial currents—cyclones, anti-cyclones, and dry south-east winds—extend over wide surfaces and cross the flat plains freely. Everywhere we find a cold winter and a hot summer, both varying in their duration, but differing relatively little in the extremes of temperature recorded. From Table III. (page 76) it will be seen that there is no place in Russia, Archangel and Astrakhan included, where the thermometer does not rise in summer nearly to 86° Fahr. and descend in winter to -13° and -22°. It is only on the Black Sea coast that we find the absolute range of temperature reduced to 108°, while in the remainder of Russia it reaches 126° to 144°, the oscillations being between -22° to -31°, occasionally -54°, and 86° to 104°, occasionally, 109°. Everywhere the rainfall is small: if Finland and Poland on the one hand and Caucasus with the Caspian depression on the other be excluded, the average yearly rainfall varies between the limits of 16 and 28 inches. Everywhere, too, we find that the maximum rainfall does not take place in winter (as in western Europe) but in summer, and that the months of advanced spring are warmer than the corresponding months of autumn.

Though thus exhibiting all the distinctive features of a continental climate, Russia is not altogether exempt from the moderating influence of the ocean. The Atlantic cyclones also reach the Russian plains, mitigating to some extent the cold of the winter, and in summer bringing with them their moist winds and thunderstorms; their influence is chiefly felt in western Russia, but extends also towards and beyond the Urals. They thus check the extension and limit the duration of the cold anticyclones.

Throughout Russia the winter is of long continuance. The last days of frost are experienced for the most part in April, but also in May to the north of 55°. The spring is exceptionally beautiful in central Russia; late as it usually is, it sets in with vigour, and vegetation develops with a rapidity which gives to this season in Russia a special charm, unknown in warmer climates; the rapid melting of snow at the same time raises the rivers, and renders a great many minor streams navigable for a few weeks. But a return of cold weather, injurious to vegetation, is observed throughout central and eastern Russia between May 18 and 24, so that it is only in June that warm weather sets in definitely, reaching its maximum in the first half of July (or of August on the Black Sea coast). The summer is much warmer than might be supposed; in south-eastern Russia it is much warmer than in the corresponding latitudes of France, and really hot weather is experienced everywhere. It does not, however, prevail for long, and in the first half of September the first frosts begin to be experienced on the middle Urals; they reach western and southern Russia in the first days of October, and are felt on the Caucasus about the middle of November. The temperature descends so rapidly that a month later, about October 10 on the middle Urals and November 15 throughout Russia, the thermometer ceases to rise above the freezing-point. The rivers rapidly freeze; towards November 20 all the streams of the White Sea basin are covered with ice, and so remain for an average of 167 days; those of the Baltic, Black Sea, and Caspian basins freeze later, but about December 20 nearly all the rivers of the

country are highways for sledges. The Volga remains frozen for a period varying between 150 days in the north and 90 days at Astrakhan, the Don for 100 to 110 days, and the Dnieper for 83 to 122 days. On the Dniina ice prevents navigation for 125 days, and even the Vistula at Warsaw remains frozen for 77 days. The lowest temperatures are experienced in January, in which month the average is as low as 20° to 5° Fahr. throughout Russia; in the west only does it rise above 22°. On the whole, February and March continue to be cold, and their average temperatures rise above zero only on the Black Sea coast. Even at Kieff and Lugan the average of March is below 30°, while in central Russia it is 25° to 22°, and as low as 20° and 16° at Samara and Orenburg.

Isotherms.—All Russia is comprised between the isotherms of 32° and 54°. On the whole, they are more remote from one another than even on the plains of North America, those of 46° to 32° being distributed over 20 degrees of latitude. They are, on the whole, inclined towards the south in eastern Russia; thus the isotherm of 39° runs from St Petersburg to Orenburg, and that of 35° from Torneå to Uralsk. The inflexion is still greater for the winter isotherms. Closely following one another, they run almost north and south; thus Odessa and Königsberg are situated on the same winter isotherm of 28°; so also St Petersburg, Orel, and the mouth of the Ural river (about 20°); Mezen and Ufa (9°). The summer isotherms cross the above nearly at right angles, so that Kieff and Ufa, Warsaw and Tobolsk, Riga and the upper Kama have the same average summer temperatures of 64°, 62½°, and 61°.

Winds, Moisture, Rainfall.—The investigation of the cyclones and anticyclones in Russia cannot as yet be regarded as completed. It appears, however, that in January the cyclones mostly cross north-west Russia (north of 55° and west of 40° E. long.), following directions which vary between north-east and south-east. In July they are displaced towards the north, and cross the Gulf of Bothnia, while another series of cyclones crosses middle Russia, between 50° and 55° N. lat. The laws of the anticyclones are not yet established. The winds closely depend on the routes followed by both. Generally, however, it may be said that alike in January and in July west and south-west winds prevail in western Russia, while eastern ones are most common in south-eastern Russia; northern winds are most common on the Black Sea coast. The strength of the wind is greater, on the whole, than in the continental parts of western Europe, and it attains its maximum in winter. Terrible gales blow from October to March, especially on the southern steppes and on the tundras. Gales with snow (*burans, myatels*), lasting from two to three days, or northerly gales without snow, are especially dangerous to man and beast. The average relative moisture reaches 80 to 85 per cent. in the north, and only 70 to 81 per cent. in southern and eastern Russia. In the steppes it is only 60 per cent. during summer, and still less (57) at Astrakhan. The average amount of cloud reaches 73 to 75 per cent. on the White Sea and in Lithuania, 68 to 64 in central Russia, and only 59 to 53 in the south and south-east. The amount of rainfall is shown in the subjoined table (III.):—¹

Flora.

The flora of Russia, which represents an intermediate link between those of Germany and Siberia, is strikingly uniform over a very large area. Though not poor at any given place, it appears so if the space occupied by Russia be taken into account, only 3800 species of phanerogams and ferns being known. Four great regions may be distinguished:—the Arctic, the Forest, the Steppe, and the Circum-Mediterranean.

The *Arctic Region* comprises the *tundras* of the Arctic littoral beyond the northern limit of forests, which last closely follows the coast-line, with bends towards the north in the river valleys (70° N. lat. in Finland, on the Arctic Circle about Archangel, 68° N. lat. on the Urals, 71° on West Siberia). The shortness of the summer, the deficiency of drainage, and the thickness of the layer of soil which is frozen through in winter are the elements which go to the making of the characteristic features of the tundras. Their flora is far nearer those of northern Siberia and North America than that of central Europe. Mosses and lichens cover them, as also the birch, the dwarf willow, and a variety of shrubs; but where the soil is drier, and humus has been able to accumulate, a variety of herbaceous flowering plants, some of which are familiar also in western Europe, make their appearance. Only from 275 to 280 phanerogams are found within this region.

The *Forest Region* of the Russian botanists occupies the greater part of the country, from the Arctic tundras to the Steppes, and it maintains over this immense surface a remarkable uniformity of character. M. Beketoff subdivides it into two portions—the forest region proper, and the "Ante-Steppe" (*predstepie*). The northern limit of the Ante-Steppe would be represented by a line drawn from the South Pruth through Zhitomir, Kursk, Tamboff, and Stavropol-on-Volga to the sources of the Ural. But the

forest region proper itself presents a certain variety of aspect in its northern and southern parts, and must in turn be again subdivided into two parts—the coniferous region and that of the oak forests,—these being separated by a line drawn through Pskoff, Kostroma, Kazañ, and Ufa. Of course, the oak occurs farther north than this, and conifer forests extend farther south, advancing even to the border-region of the Steppes; but this line must still be considered as important. To the north of it we have dense forests, covering very large areas, and interrupted oftener by marshes than by meadows or cultivated fields. Vast and impenetrable forests, unpassable marshes and thickets, frequent lakes, swampy meadows, with cleared and dry spaces here and there occupied by villages, are the leading features of the region. Fishing and hunting are the important sources of livelihood. The characteristics of what may be described as the oak region, which comprises all central Russia, are totally different. The surface is undulatory; marshy meadow lands no longer exist on the flat watersheds, and only a few shelter themselves in the much deeper and broader river valleys. Forests are still numerous where not destroyed by man, but their character has changed. Conifers are rare, and the Scotch pine, which covers the sandy plains, has taken the place of the *Abies*; birch, oak, and other deciduous trees

compose the forests, the soil of which is dry, and the extension of which is interrupted by green prairies. Viewed from a rising ground, the landscape presents a pleasing variety of corn-field and forest, while the horizon is broken by the bell-towers of numerous villages along the banks of the streams.

Viewed as a whole, the flora of the forest region must be regarded as European-Siberian; and, though certain species disappear towards the east, while new ones make their appearance, it maintains, on the whole, the same characters throughout from Poland to Kamchatka. Thus the beech (*Fagus sylvatica*), a characteristic tree of western Europe, is unable to face the continental climate of Russia, and does not penetrate beyond Poland and the south-western provinces, reappearing again in the Crimea. The silver fir (*Pichta*) does not extend over Russia, and the oak does not cross the Urals. On the other hand, several Asiatic species (Siberian pine, larch, cedar) grow freely in the north-east, while several shrubs and herbaceous plants, originally from the Asiatic steppes, have spread into the south-east. But all these do not greatly alter the general characters of the vegetation. The coniferous forests of the north contain, besides conifers, the birch (*Betula alba*, *B. pubescens*, *B. fruticosa*, and *B. verrucosa*, which extend from the Petchora to the Caucasus), the aspen, two species of alder, the mountain-ash (*Sorbus aucuparia*), the wild cherry-tree, and three species of willow. South of 62°–64° north latitude appears the lime-tree, which multiplies rapidly and, notwithstanding the rapidity with which it is being exterminated, constitutes entire forests in the east (central Volga, Ufa). Farther south the ash (*Fraxinus excelsior*) and the oak make their appearance, the latter (*Quercus pedunculata*) reaching in isolated groups and trees as far as to St Petersburg and South Finland (*Q. Robur* appears only in the south-west). The hornbeam is prevalent in the Ukraine, and the maple begins to appear in the south part of the coniferous region. In the forest region no fewer than 772 flowering species are found, of which 568 dicotyledons occur in the Archangel government (only 436 to the east of the White Sea, which is a botanical limit for many species). In central Russia the species become still more numerous, and, though the local floras cannot yet be considered complete, they number from 850 to 1050 species in the separate governments, and about 1600 in the best explored parts of the south-west. Corn is cultivated throughout this region. Its northern limits—which are sure to advance still farther as the population increases—almost reach the Arctic coast at the Varanger Fjord; farther east they hardly extend to the north of Archangel, and the limit is still lower towards the Urals. The northern frontier of rye closely corresponds to that of barley. Wheat is cultivated in South Finland, but in western Russia it hardly passes 58° N. lat. Its true domains are the oak region and the Steppes. Fruit-trees are cultivated as far as 62° N. in Finland, and as far as 58° in the east. Apricots and walnuts flourish at Warsaw, but in Russia they do not extend beyond 50°. Apples, pears, and cherries are grown throughout the oak region.

The Region of the Steppes, which covers all southern Russia, may be subdivided into two zones—an intermediate zone and that of the Steppes proper. The Ante-Steppe of the preceding region and the intermediate zone of the Steppes include those tracts where the West-European climate struggles with the Asiatic, and where a struggle is being carried on between the forest and the Steppe. It is comprised between the summer isotherms of 59° and 63°, being bounded on the south by a line which runs through Ekaterinoslaw and Lugan. South of this line begin the Steppes proper, which extend to the sea and penetrate to the foot of Mount Caucasus.

The Steppes proper are very fertile elevated plains, slightly undulated, and intersected by numerous ravines which are dry in summer. The undulations are scarcely apparent to the eye as it takes in a wide prospect under a blazing sun and with a deep-blue sky overhead. Not a tree is to be seen, the few woods and thickets being hidden in the depressions and deep valleys of the rivers. On the thick sheet of black earth by which the Steppe is covered a luxuriant vegetation develops in spring; after the old grass has been burned a bright green covers immense stretches, but this rapidly disappears under the burning rays of the sun and the hot easterly winds. The colouring of the Steppe changes as if by magic, and only the silvery plumes of the *kovyl* (*Stipa pennata*) wave under the wind, giving the Steppe the aspect of a bright yellow sea. For days together the traveller sees no other vegetation; even this, however, disappears as he nears the regions recently left dry from the Caspian, where salted clays covered with a few *Salsolaceae*, or mere sands, take the place of the black-earth. Here begins the Aral-Caspian desert. The Steppe, however, is not so devoid of trees as at first sight appears. Innumerable clusters of wild cherries (*Prunus Chamæcerasus*), wild apricots (*Amygdalus nana*), *tchilichnik* (*Ceragana frutescens*), and other deep-rooted shrubs grow in the depressions of the surface and on the slopes of the ravines, giving the Steppe that charm which manifests itself in the popular poetry. Unfortunately the spread of cultivation is fatal to these oases (they are often called "islands" by the inhabitants); the axe and the plough ruthlessly destroy them.

The vegetation of the *poimy* and *zaimischas* in the marshy bottoms of the ravines, and in the valleys of streams and rivers, is totally different. The moist soil gives free development to thickets of various willows (*Salicinesæ*), bordered with dense walls of worm-wood and needle-bearing *Compositæ*, and interspersed with rich but not extensive prairies harbouring a great variety of herbaceous plants; while in the deltas of the Black Sea rivers impenetrable masses of rush (*Arundo Phragmites*) shelter a forest fauna. But cultivation rapidly changes the physiognomy of the Steppe. The prairies are superseded by wheat-fields, and flocks of sheep destroy the true steppe-grass (*Stipa pennata*), which retires farther east.

A great many species unknown in the forest region make their appearance in the Steppes. The Scotch pine still covers sandy spaces, and maple (*Acer tatarica* and *A. campestre*), the hornbeam, and the white and black poplar become quite common. The number of species of herbaceous plants rapidly increases, while beyond the Volga a variety of Asiatic species join the West-European flora.

The Circum-Mediterranean Region is represented by a narrow strip of land on the south coast of the Crimea, where a climate similar to that of the Mediterranean coast has permitted the development of a flora closely resembling that of the valley of the Arno. Of course, human cultivation has not yet acclimatized there the same variety of plants as that imported into Italy since the Romans. It has even destroyed the rich forests which sixty years ago made deer-hunting possible at Khersones. The olive and the chestnut are rare; but the beech reappears, and the *Pinus Pinaster* recalls the Italian pines. At a few points, such as the Nikitsky garden and Alupka, where plants have been acclimatized by human agency, the Californian *Wellingtonia*, the Lebanon cedar, many evergreen trees, the laurel, the cypress, and even the Anatolian palm (*Chamærops excelsa*) flourish. The grass vegetation is very rich, and, according to lists still incomplete, no fewer than 1654 flowering plants are known. On the whole, the Crimean flora has little in common with that of the Caucasus, where only 244 Crimean species have as yet been found.¹

The fauna of European Russia does not very materially differ from that of western Europe. In the forests not many animals which have disappeared from western Europe have held their ground; while in the Urals only a few—now Siberian, but formerly also European—are met with. On the whole, Russia belongs to the same zoo-geographical region as central Europe and northern Asia, the same fauna extending in Siberia as far as the Yenisei and Lena. In south-eastern Russia, however, towards the Caspian, we find a notable admixture of Asiatic species, the deserts of that part of Russia belonging in reality rather to the Aral-Caspian depression than to Europe.

For the zoo-geographer only three separate sub-regions appear on the East-European plains—the tundras, including the Arctic islands, the forest region, especially the coniferous part of it, and the Ante-Steppe and Steppes of the black-earth region. The Ural mountains might be distinguished as a fourth sub-region, while the south coast of the Crimea and Caucasus, as well as the Caspian deserts, have their own individuality.

As for the adjoining seas, the fauna of the Arctic Ocean off the Norwegian coast corresponds, in its western parts at least, to that of the North Atlantic Gulf Stream. The White Sea and the Arctic Ocean to the east of Svyatoi Nos belong to a separate zoological region connected with, and hardly separable from, that part of the Arctic Ocean which extends along the Siberian coast as far as to about the Lena. The Black Sea, of which the fauna was formerly little known but now appears to be very rich, belongs to the Mediterranean region, slightly modified, while the Caspian partakes of the characteristic fauna inhabiting the lakes and seas of the Aral-Caspian depression.

In the region of the tundras life has to contend with such unfavourable conditions that it cannot be abundant. Still, the reindeer frequents it for its lichens, and on the drier slopes of the moraine deposits four species of lemming, hunted by the *Canis lagopus*, find quarters. Two species of the white partridge (*Lagopus albus*, *L. alpinus*), the lark, one *Plectrophanes*, two or three species of *Sylvia*, one *Phylloscopus*, and the *Motacilla* must be added. Numberless aquatic birds, however, visit it for breeding purposes. Ducks, divers, geese, gulls, all the Russian species of snipes and sandpipers (*Limicola*, *Tringa*, &c.), cover the marshes of the tundras, or the crags of the Lapland coast.

The forest region, and especially its coniferous portion, though it has lost some of its representatives within historic times, is still rich. The reindeer, rapidly disappearing, is now met with only in Olonetz and Vologda; the *Cervus pygargus* is found everywhere, and reaches Novgorod. The weasel, the fox, and the hare are exceed-

¹ Bibliography.—Beketoff, Appendix to Russian translation of Griesbach and Reclus's *Geogr. Univ.*; Ledebour, *Flora Rossica*; Trautvetter, *Rossia Arctica Plantæ*, 1880; Id., *Flora Rossica Fontes*; for flora of the tundras, Beketoff's "Flora of Archangel," in *Mem. Soc. Natur.* at St Petersburg university, xv., 1884; Regel, *Flora Rossica*, 1884; floras of separate governments in several scientific periodicals; Brown, *Forestry in the Mining Districts of the Urals*, 1885; Reports by Commissioners of Woods and Forests in Russia, 1884; *Forestry Almanac* (*Lyenoï Kalendar*) for 1885.

ingly common, as also the wolf and the bear in the north; but the glutton (*Gulo borealis*), the lynx, and even the elk (*C. alces*) are rapidly disappearing. The wild boar is confined to the basin of the Dvina, and the *Bison europæa* to the Bielovyezha forests. The sable has quite disappeared, being found only on the Urals; the beaver is found at a few places in Minsk, and the otter is very rare. On the other hand, the hare (*roussak*), and also the grey partridge (*Perdix cinerea*), the hedgehog, the quail, the lark, the rook (*Trypanocorax frugilega*), and the stork find their way into the coniferous region as the forests are cleared (Bogdanoff). The avifauna of this region is very rich; it includes all the forest and garden birds which are known in western Europe, as well as a very great variety of aquatic birds. A list, still incomplete, of the birds of St Petersburg shows 251 species. Hunting and shooting give occupation to a great number of persons. The reptiles are few. As for fishes, all those of western Europe, except the carp, are met with in the lakes and rivers in immense quantities, the characteristic feature of the region being its wealth in *Coregoni* and in *Salmonidæ* generally.

In the Ante-Steppe the forest species proper, such as *Pteromys volans* and *Tamias striatus*, disappear, but the common squirrel (*Sciurus vulgaris*), the weasel, and the bear are still met with in the forests. The hare is increasing rapidly, as well as the fox. The avifauna, of course, becomes poorer; nevertheless the woods of the Steppe, and still more the forests of the Ante-Steppe, give refuge to many birds, even to the hazel-hen (*Tetrao bonasia*), the woodcock, and the black grouse (*Tetrao tetrix*, *T. urogallus*). The fauna of the thickets at the bottom of the river valleys is decidedly rich, and includes aquatic birds. The destruction of the forests and the advance of wheat into the prairies are rapidly impoverishing the Steppe fauna. The various species of rapacious animals are disappearing, together with the colonies of marmots; the insectivores are also becoming scarce in consequence of the destruction of insects, while vermin, such as the suslik (*Spermophilus*, see MARMOT), become a real plague, as also the destructive insects which have been a scourge to agriculture during recent years.¹ The absence of *Coregoni* is a characteristic feature of the fish-fauna of the Steppes; the carp, on the contrary, reappears, and the rivers are rich in sturgeons (*Acipenserides*). On the Volga below Nijni Novgorod the sturgeon (*Acipenser ruthenus*), and others of the same family, as also a very great variety of ganoids and *Telosteï*, appear in such quantities that they give occupation to nearly 100,000 people. The mouths of the Caspian rivers are especially celebrated for their wealth of fish.²

Ethnography.

Prehistoric anthropology is a science of very recent growth in Russia; and, notwithstanding the energy displayed within that field during the last twenty years, the task of reconstructing the early history of man on the plains of eastern Europe is daily becoming more complicated as new data are brought to light. Remains of Palæolithic man, contemporary with the large Quaternary mammals, are few in Russia; they are known only in Poland, Pottava, and Voronezh, and perhaps also on the Oka. Those of the later portions of the Lacustrine period, on the contrary, are so numerous that scarcely one old lacustrine basin in the regions of the Oka, the Kama, the Dnieper, not to speak of the lake-region itself, and even the White Sea coasts, can be mentioned where remains of Neolithic man have not been discovered, showing an unexpected variety of minor anthropological features, even at that remote period. The Russian plains have been, however, the scene of so many migrations of various races of mankind, the dwelling-places of prehistoric man and the routes followed during his migrations were so clearly indicated by natural conditions, and so often re-occupied, or again covered by new waves of colonization and migration, that at many places a series of deposits belonging to widely distant epochs are found superposed. Settlements belonging to the Stone age, and manufactories of stone implements, burial grounds (*kostishchas*) of the Bronze epoch, earthen forts (*gorodishchas*), and

grave mounds (*kurgans*)—of which last four different types are known, the earliest belonging to the Bronze period—are superposed upon and obliterate one another, so that a long series of researches is necessary in order that sound generalizations may be reached.

Two different races—a brachycephalic and a dolichocephalic—can be distinguished among the remains of the earlier Stone period (Lacustrine period) as having inhabited the plains of eastern Europe. But they are separated by so many generations from the earliest historic times that sure conclusions regarding them are impossible; at all events, as yet Russian archaeologists are not agreed as to whether the ancestors of the Slavonians were Sarmatians only or Scythians also (Samokvasoff, Lemièrre), whose skulls have nothing in common with those of the Mongolian race. The earliest points that can, comparatively speaking, be regarded as settled must thus be taken from the 1st century, when the Northern Finns migrated from the North Dvina region towards the west, and the Sarmatians were compelled to leave the region of the Don, and to cross the Russian steppes from east to west, under the pressure of the Aorzes (the Mordvinian Erzya?) and Siraks, who in their turn were soon followed by the Huns and the Ugur-Turkish stem of Avars.

It appears certain, moreover, that in the 7th century southern Russia was occupied by the empire of the KHAZARS (*q.v.*), who drove the Bulgarians, descendants of the Huns, from the Don, one section of them migrating up the Volga to found there the Bulgarian empire, and the remainder migrating towards the Danube. This migration compelled the Northern Finns to advance farther west, and a mixture of Tavasts and Karelians penetrated to the south of the Gulf of Finland.

Finally, it is certain that as early as the 8th century, and probably still earlier, a stream of Slavonian colonization, advancing eastward from the Danube, was thrown on the plains of south-western Russia. It is also most probable that another similar stream—the northern, coming from the Elbe, through the basin of the Vistula—ought to be distinguished. In the 9th century the Slavonians already occupied the Upper Vistula, the southern part of the lake region, and the central plateau in its western parts. They had Lithuanians to the west; various Finnish stems, mixed towards the south-east with Turkish stems (the present Bashkirs); the Bulgars, whose origin still remains doubtful, on the middle Volga and Kama; and to the south-east the Turkish-Mongolian world of the Petchenegs, Potovtsi, Uzes, &c.; while in the south, along the Black Sea, extended the empire of the Khazars, who kept under their rule several Slavonian stems, and perhaps also some of Finnish origin. In the 9th century also the Ugrians are supposed to have left their Ural abodes and to have crossed south-eastern and southern Russia on their way to the basin of the Danube.

If these numerous migrations on the plains of Russia be taken into account, and if we add to them the Mongolian invasion, the migration of South Slavonians towards the Oka, the North Slavonian colonization extending north-east towards the Urals and thence to Siberia, the slow advance of Slavonians into Finnish territory on the Volga, and at a later period their advance into the prairies on the Black Sea, driving back the Turkish stems which occupied them,—if we consider the manifold mutual influences of these three races on one another, we shall be able to form a faint idea of the present population of European Russia.

If the Slavonians be subdivided into three branches—the western (Poles, Czechs, and Wends), the southern (Serbs, Bulgarians, Croats, &c.), and the eastern (Great, Little, and White Russians), it will be seen that, with the exception of some 3,000,000 Ukrainians or Little Russians, in East Galicia and in Poland, and a few on the south slope of the Carpathians, the whole of the East Slavonians occupy, as a compact body, western, central, and southern Russia.

Like other races of mankind, the Russian race is not a pure one. The Russians have taken in and assimilated in the course of their history a variety of Finnish and Turco-Finnish elements. Still, craniological researches show that, notwithstanding this fact, the Slavonian type has maintained itself with remarkable persistency—Slavonian skulls ten and thirteen centuries old exhibiting the same anthropological features as are seen in those of our own day. This may be explained by a variety of causes, of which the chief is the maintenance by the Slavonians down to a very late period of gentile organization and gentile marriages, a fact vouched for, not only in the pages of Nestor, but still more by deep traces still visible in the face of society, the *gens* later on passing into the village community, and the colonization being carried on by great compact bodies. This has all along maintained the same characters. The Russians do not emigrate as isolated individuals; they migrate in whole villages. The overwhelming numbers of the Slavonians, and the very great differences in ethnical type, belief, mythology, between the Aryans and Turanians, may have contributed in the same direction, and throughout the written history of the Slavonians we see that, while a Russian man, far away from his home among Siberians, readily marries a native, the Russian woman seldom does the like. All these causes, and especially the first-mentioned, have enabled the Slavonians to maintain their ethnical features in a

¹ The Year 1884 with regard to Agriculture, St Petersburg, 1885, gives nearly complete lists of them.

² Bibliography.—There being no general recent work published on the fauna of Russia, beyond a valuable sketch (for the general reader) by M. Bogdanoff in the Appendix to the Russian translation of Reclus's *Géogr. Univ.*, v., the classical work of Pallas, *Zoographia Rosso-Asiatica*, and the works dealing with different departments of the fauna in different parts of Russia, must be resorted to. These include the following:—Syevertsoff, for the birds of south-eastern Russia; Bogdanoff, *Birds and Mammals of the Black-Earth Region of the Volga Basin*; Karel'in for the southern Urals; Kessler for fishes; Strauch, *Die Schlangen des Russ. R.*, for reptiles generally; Rodoszkowski and the publications of the Entomological Society generally for insects; Czerniavsky for the marine fauna of the Black Sea; Kessler for that of Lakes Onega and Ladoga; Grimm for the Caspian; and the publications of the scientific societies for a very great number of monographs dealing with departments of the fauna of separate governments, seas, and lakes. The fauna of the Baltic provinces is described in full in the *Memoirs* of the scientific bodies of these provinces. Middendorff's *Sibirische Reise*, vol. iv., *Zoology*, though dealing more especially with Siberia, is an invaluable source of information for the Russian fauna generally. *Vega-expeditionens Vetenskapliga Jakttagelser* may be consulted for the mammals of the tundra region and marine fauna. For more detailed bibliographical information see *Aperçu des travaux zoo-géographiques*, published at St Petersburg in connexion with the Exhibition of 1878; and the index *Ukasatel' Russkon Literatury* for natural science, mathematics, and medicine, published since 1872 by the Society of the Kieff university.

relatively high degree of purity, so as to assimilate foreign elements and make them reinforce or improve the ethnical type, without giving rise to half-breed races. The maintenance of the very same North-Russian type from Novgorod to the Pacific, with but minor differentiations on the outskirts—and this notwithstanding the great variety of races with which the Russians came in contact—cannot but strike the observer. But a closer observation of what is going on even now on the recently colonized confines of the empire—where whole villages live, and will continue to live, without mixing with natives, but very slowly bringing them over to the Russian manner of life, and then very slowly taking in a few female elements from them—gives the key to this prominent feature of Russian life, which is a colonization on an immense scale, and assimilation of foreigners, without in turn losing the primary ethnical features.

Not so with the national customs. There are features—the wooden house, the oven, the bath—which the Russian never abandons though lost amidst alien populations. But when settled among these the Russian—the North-Russian—readily adapts himself to many other differences. He speaks Finnish with Finns, Mongolian with Buriats, Ostiak with Ostiaks; he shows remarkable facility in adapting his agricultural practices to new conditions, without, however, abandoning the village community; he becomes hunter, cattle-breeder, or fisherman, and carries on these occupations according to local usage; he modifies his dress and adapts his religious beliefs to the locality he inhabits. In consequence of all this, the Russian peasant (not, be it noted, the trader) must be recognized as the best colonizer among the Aryans; he lives on the best terms with Ostiaks, Tartars, Buriats, and even with Red Indians when lost in the prairies of the American Far-West.

Three different branches, which may become three separate nationalities, can be distinguished among the Russians since the dawn of their history:—the Great Russians, the Little Russians (Malorusses or Ukrainians), and the White Russians (the Bielorusses). These correspond to the two currents of immigration mentioned above, the northern and southern, with perhaps an intermediate one, the proper place of the White Russians not having as yet been exactly determined. The primary distinctions between these branches have been increased during the last nine centuries by their contact with different nationalities,—the Great Russians taking in Finnish elements, the Little Russians undergoing an admixture of Turkish blood, and the White Russians submitting to Lithuanian influence. Moreover, notwithstanding the unity of language, it is easy to detect among the Great Russians themselves two separate branches, differing from one another by slight divergences of language and type and deep diversities of national character,—the Central Russians and the Novgorodians; the latter extend throughout northern Russia into Siberia. They correspond, perhaps, to subdivisions mentioned by Nestor. It is worthy of notice, moreover, that many minor anthropological features can be distinguished both among the Great and Little Russians, depending probably on the assimilation of various minor subdivisions of the Ural-Altaians.

The Great Russians number about 42,000,000, and occupy in one block the space enclosed by a line drawn from the White Sea to the sources of the western Duna, the Dneiper, and the Donetz, and thence, through the mouth of the Sura, by the Vettuga, to Mezeñ. To the east of this boundary they are mixed with Turco-Finns, but in the Ural Mountains they reappear in a compact body, and extend thence through southern Siberia and along the courses of the Lena and Amur. Great Russian nonconformists are disseminated among Little Russians in Tchernigoff and Moghileff, and they reappear in greater masses in Novorossia, as also in northern Caucasia.

The Little Russians, who number about 17,000,000, occupy the Steppes of southern Russia, the south-western slopes of the central plateau and those of the Carpathian and Lublin mountains, and the Carpathian plateau. The Sitch of the Zaporog Cossacks colonized the Steppes farther east, towards the Don, where they met with a large population of Great Russian runaways, constituting the present Don Cossacks. The Zaporog Cossacks, sent by Catherine II. to colonize the east coast of the Sea of Azoff, constituted there the Black Sea and later the Kuban Cossacks (part of whom, the Nekrasovtsy, migrated to Turkey). They have also peopled large parts of Stavropol and northern Caucasia.

The White Russians, mixed to some extent with Great and Little Russians, Poles, and Lithuanians, now occupy the upper parts of the western slope of the central plateau. They number about 4,300,000.

The Finnish stems, which in prehistoric times extended from the Obi all over northern Russia, even then were subdivided into Ugrians, Permians, Bulgarians, and Finns proper, who drove back the previous Lapp population from what is now Finland, and about the 7th century penetrated to the south of the Gulf of Finland, in the region of the Lives and Kurs, where they mixed to some extent with Lithuanians and Letts.

At present the stems of Finnish origin are represented in Russia by the following:—(a) the Western Finns; the Tavasts in central Finland; the Kvånes, in north-western Finland; the Karelians,

in the east, who also occupy the lake-regions of Olonetz and Archangel, and have settlements in separate villages in Novgorod and Tver; the Izhora and Vod, which are local names for the Finns on the Neva and the south-eastern coast of the Gulf of Finland; the Esthes in Esthonia and northern portion of Livonia; the Lives on the Gulf of Riga; and the Kors, mixed with the Letts; (b) the Northern Finns, or Lapps, in northern Finland and on the Kola peninsula, and the Samoyedes in Archangel; (c) the Volga Finns, or rather the old Bulgarian branch, to which belong the MORDVINIANS (*q.v.*) and perhaps the Tcheremisses in Kazan, Kostroma, and Vyatka, who are also classified by some authors with the following; (d) the Permians, or Cis-Uralian Finns, including the Votiaks on the east of Vyatka, the Permians in Perm, the Zyrians in Vologda, Archangel, Vyatka, and Perm, and the Tcheremisses; (e) the Ugrians, or Trans-Uralian Finns, including the Voguls on both slopes of the Urals, the Ostiaks in Tobolsk and partly in Tomsk, and the Madjares, or Ugrians.

The Turco-Tartars in European Russia number about 3,600,000.

The following are their chief subdivisions. (1) The Tartars, of whom three different stems must be distinguished:—(a) the Kazan Tartars on both banks of the Volga, below the mouth of the Oka, and on the lower Kama, penetrating also farther south in Ryazan, Tamboff, Samara, Simbirsk, and Penza; (b) the Tartars of Astrakhan at the mouth of the Volga; and (c) those of the Crimea, a great many of whom have recently emigrated to Turkey. There are, besides, a certain number of Tartars from the south-east in Minsk, Grodno, and Vilna. (2) The Bashkirs, who inhabit the slopes of the southern Urals, that is, the Steppes of Ufa and Orenburg, extending also into Perm and Samara. (3) The Tchuvas, on the right bank of the Volga, in Kazan and Simbirsk. (4) The Mescheriaks, a tribe of Finnish origin which formerly inhabited the basin of the Oka, and, driven thence during the 15th century by the Russian colonizers, immigrated into Ufa and Perm, where they now live among Bashkirs, having adopted their religion and customs. (5) The Tepters, also of Finnish origin, settled among Tartars and Bashkirs, together with the Mescheriaks, also in Samara and Vyatka. They have adopted the religion and customs of the Bashkirs, from whom they can hardly be distinguished. The Bashkirs, Mescheriaks, and Tepters have rendered able service to the Russian Government against the Kirghizes, and until 1863 they constituted a separate Bashkir and Mescheriak Cossacks army, employed for service in the Kirghiz Steppe. (6) The Kirghizes, whose true abodes were in Asia, in the Ishim and Kirghiz Steppe; but one section of them crossed the Urals and occupied the Steppes between the Urals and the Volga. Only the Horde of Bukkeff inhabits European Russia, north-east of Astrakhan, the remainder belonging to Turkestan and Siberia.

The Mongolian race is represented in Russia by the Lamaite Kalmuks, who inhabit the Steppes of Astrakhan between the Volga, the Don, and the Kuma. They immigrated to the mouth of the Volga from Dzungaria, in the 17th century, driving out the Tartars and Nogais, and after many wars with the Don Cossacks, followed by treaties of mutual assistance for military excursions, one part of them was taken in by the Don Cossacks, so that even now there are among these Cossacks several Kalmuk *sotnias* or squadrons. They live for the most part in tents, supporting themselves by cattle-breeding, and partly by agriculture.

The Semitic race is represented in Russia by upwards of 3,000,000 Jews and 3000 Karaites. The Jews first entered Poland from Germany during the crusades, and soon spread through Lithuania, Courland, the Ukraine, and, in the 18th century, Bessarabia. The rapidity with which they peopled certain towns and whole provinces was really prodigious. Thus, from having been but a few dozens at Odessa some eighty years since, they make now one-third of its population (73,400, out of 207,000). The law of Russia prohibits them from entering Great Russia, only the wealthiest and most educated enjoying this privilege; nevertheless they are met with everywhere, even on the Urals. Their chief abodes, however, continue to be Poland, the western provinces of Lithuania, White and Little Russia, and Bessarabia. In Russian Poland they are in the proportion of 1 to 7 inhabitants. In Kovno, Vilna, Moghileff, Grodno, Volhynia, Podolia, and probably also in Bessarabia and Kherson, they constitute, on the average, 10 to 16 per cent. of the population, while in separate districts the proportion reaches 30 to 36 per cent. (50.5 in Tchaussy). Organized as they are into a kind of community for mutual protection and mutual help (the Kahal), they soon become masters of the trade wherever they penetrate. In the villages they are mostly innkeepers, intermediaries in trade, and pawnbrokers. In many towns most of the skilled labourers and a great many of the unskilled (for instance, the grain-porters at Odessa and elsewhere) are Jews. In the 16 western provinces of Russia they numbered 2,843,400 in 1883, and about 432,000 in five Polish provinces. Less than 600,000 of them inhabit villages, the remainder being concentrated in towns.

The Karaites differ entirely from the Jews both in worship and in mode of life. They, too, are inclined to trade, but also success-

fully carry on agriculture. Those inhabiting the Crimea speak Tartar, and the few who are settled in western Russia speak Polish. They are on good terms with the Russians.

Of West Europeans, only the Germans attain considerable numbers (upwards of a million) in European Russia. In the Baltic provinces they constitute the ennobled landlord class, and that of tradesmen and artisans in towns. Considerable numbers of Germans, also tradesmen and artisans, were scattered throughout many of the larger towns of Russia as early as the 16th century, and to a much greater extent in the 18th century, German artisans having been invited by the Government to settle in Russia, and their numbers having steadily increased since. Finally, numbers of Germans were invited in 1762 to settle in southern Russia, as separate agricultural colonies, which gradually extended in the Don region and in northern Caucasia. Protected as they were by the right of self-government, exempted from military service, and endowed with considerable allotments of good land, these colonies are much wealthier than the neighbouring Russian peasants, from whom they have adopted the slowly modified village community. They are chiefly Lutherans, but many of them belong to other religious sects,—Anabaptists, Moravians, Mennonites (about 40,000). In certain districts (Akkerman, Odessa, Berdiansk, Kamyschin, Novouzensk) they constitute from 10 to 40 per cent. of the total population. The Swedes, who number about 300,000 in Finland, hardly reach 12,000 in European Russia, mostly in the Baltic provinces.

The Roumanians (Moldavians) number not less than 800,000, and are still increasing. They inhabit the governments of Bessarabia, Podolia, Kherson, and Ekaterinoslaff. In Bessarabia they constitute from one-fourth to three-fourths of the population of certain districts. On the whole, the Novorossian governments (Bessarabia, Kherson, Ekaterinoslaff, and Taurida) exhibit the greatest variety of population. Little and Great Russians, Roumanians, Bulgarians, Serbs, Germans, Greeks, Frenchmen, Poles, Tartars, and Jews are mixed together and scattered about in small colonies, especially in Bessarabia. Of course, the Greeks inhabit chiefly the towns, where they carry on trade, as also do the Armenians, scattered through the towns of southern Russia, and appearing in larger numbers only in the district of Rostoff (10 per cent. of population).

Geo-
graphical
distribu-
tion of
races.

However great the variety of nationalities inhabiting European Russia, its ethnological composition is much simpler than might at first sight be supposed. The Russians—Great, Little, and White—largely prevail over all others, both numerically and as respects the territories they occupy in compact bodies. Central Russia is almost purely Great Russian, and represents a compact body of more than 30,000,000 inhabitants with but 1 to 5 per cent. of admixture of other nationalities. The governments on the Dnieper (Kieff, Volhynia, Tchernigoff, Podolia, and Pottava), as also the adjoining districts of Kharkoff, Voronezh, Kursk, and Don, are Little-Russian, or Ukrainian, with but a slight admixture of White and Great Russians, and some 12 per cent. of Jews. The Poles there number only 3 to 6 per cent. of the population—chiefly landholders—and are hated by the Ukrainians.

Moghileff, Vitebsk, and Minsk are White Russian, the Poles constituting only 3 per cent. of the population (16 in Minsk). In other Belorussian provinces, the White Russians are mixed either with Lithuanians (Vilna), or Ukrainians (Grodno), or Great Russians (Smolensk), and their relations to Polish landlords are no better than in the Ukraine. The Lithuanians prevail in Kovno, where they are 80 per cent. of the population, the remainder being chiefly Jews (10 per cent.), Poles (3 per cent.), Great Russians (3 per cent.), Germans, &c.

In the Baltic provinces (Esthonia, Livonia, and Courland) the prevailing population is Esthonian, Curonian, or Lettish, the Germans (landlords, or tradesmen and artisans in towns) being respectively only 3·5, 6·8, and 7·6 per cent. of the population. In the three provinces, Riga included, they hardly reach 120,000 out of 1,800,000 inhabitants. The relations of the Esthes and Letts to their landlords are anything but friendly.

The northern governments of St Petersburg (apart from the capital), Olonetz, and Archangel contain an admixture of 12 to 23 per cent. of Karelians, Samoyedes, and Zyrians, the remainder being Great Russians. In the east and south-east provinces of the Volga (Nijni, Simbinsk, Samara, Penza, and Saratoff) the Great Russians again prevail (88 to 65 per cent.), the remainder being chiefly Mordvians, rapidly Russifying, as also Tartars, Tchuvasches, and Bashkirs, Germans in Samara and Saratoff, and Little Russians in the last-named. Only in Kazan and Astrakhan do the Great Russians number less than one half of the aggregate population (42–43 per cent.). In the Ural provinces of Perm and Vyatka Great Russians are again in the majority (92 and 81 per cent.), the remainder being a variety of Finno-Tartars. It is only in the southern Ural governments (Uralsk, Orenburg, Ufa) that the admixture of a variety of Turco-Tartars—of Kirghizes in Uralsk (23 per cent.), Bashkirs in Orenburg and Ufa (22 and 23 per cent.), and less important stems—becomes considerable, reducing the

number of Great Russians respectively to 72, 67, and 32 per cent. of the aggregate population of these three provinces.

Of the Turco-Tartars of eastern Russia, the Bashkirs often revolted against Russian rule, and the traffic in Bashkir lands, recently carried on by the Orenburg administration, certainly does not tend to reconcile them. The Tcheremisses have often joined the Bashkirs in their revolts, but are rapidly losing their nationality. As regards the other Turco- and Finno-Tartars, the Mordvians really have been assimilated to the Russians; the Moslem Tartars of Kazan lived till recently on excellent terms with their Russian neighbours and would have continued to do so had no attempts been made to interfere with their land-laws.

In western Russia, while an antipathy exists between Ukrainians and Poles, the Russian Government, by its harassing interference in religious, educational, and economical matters, has become antagonistic, not only to the Poles, but also to the Ukrainians; printing in Ukrainian is prohibited, and "Russification" is being carried on among Ukrainians by the same means as those employed in Poland. The same is true with the Esthes and Letts, whom the Government, while countenancing them to some extent in their antipathy to the German aristocracy, has not yet found means to conciliate.

The relative strength of the different ethnical elements of which Their the population of European Russia and Poland is composed may relative be seen from the following figures (Table IV.). They must be strength regarded, however, as rough estimates only. They were originally computed by M. Rittich for an aggregate population of 69,788,240, and in the following table they have merely been increased in proportion to the actual population of 84,495,000.

PART III. EUROPEAN RUSSIA—STATISTICS.²

Density of population. Russia is on the whole a thinly-peopled country, the average population being but 42 to the square mile. The density of population varies, however, very much in European Russia—from one inhabitant per square mile in the government of Archangel to 102 in that of Moscow (exclusive of the capital) and 138 in Podolia. Two-thirds of the whole population are concentrated upon less than one-third of the whole surface. The most thickly-peopled parts form a strip of territory which extends from Galicia through Kieff to Moscow, and comprises partly the most fertile governments of Russia and partly the manufacturing ones; next come a strip of fertile country to the south of the above and the manufacturing provinces of the upper Volga. The black-earth region has an average of 90 inhabitants per square mile; the central manufacturing region, 85; the western provinces, 79; the black-earth and clay region, 38; the black-earth Steppes, 33; the hilly tracts of the Crimea and Caucasus, 31; the forest-region proper, 26; the Steppes, 9; the far north, less than 2.

Births and deaths. The rate at which the population is increasing throughout the empire is very considerable. It varies, however, very much in different parts, and even in European Russia, being almost twice as high in the fertile tracts of the south as it is in the north (1·8 to 1·0). The rapid increase is chiefly due to early marriages, the peasants for the most part marrying their sons at eighteen and their daughters at sixteen. The resulting high birth-rate compensates for the great mortality, and the Russian population is increasing more quickly than the Polish, Lithuanian, Finnish, or Tartar. In 1880 the marriages, births, and deaths were returned as follows (Table V.):—

	Marriages.	Births.	Deaths.	Excess of Births over Deaths.

These figures agree pretty nearly with those for a series of years (1871-78), which gave an annual surplus of 945,000 for European Russia alone. In 1882, throughout the empire—leaving out of account Caucasus and Turgai—the births numbered 4,403,555 and the deaths 3,464,404, for an estimated population of 95,565,100. But the birth-rate and death-rate were very different in Russia proper and in the Asiatic dominions; in the former they reached respectively 4·83 and 3·77, and in the latter only 3·75 and 2·84. The low birth-rate in Asia counterbalances the low mortality. So also within Russia proper: in the central provinces the high mortality (35 per thousand) is compensated by a high birth-rate (49), while in the western provinces, where the mortality is relatively small (27), the number of births is also the lowest (37).

On the whole, the mortality in Russia is greater than anywhere else in Europe. The lowest figures are found in Courland (20),

the Baltic provinces (22), and Poland (30). Within Russia itself the rate varies between 29 and 49 (30 to 38 in towns). In 1882 the average mortality in the 13 central governments reached the exceptional figure of 62, so that there was a decrease of 1·7 per cent. in the aggregate population. The mortality is highest among children, only one-half of those born reaching their seventh year. From military registers it appears that of 1000 males born only 480 to 490 reach their twenty-first year, and of these only 375 are able-bodied; of the remainder, who are unfit for military service, 50 per cent. suffer from chronic diseases. Misery, insubstantial dwellings, and want of food account for this high mortality, which is further increased by the want of medical help, there being in Russia with Poland only 15,348 males and 66 female surgeons, 7679 assistants, and one bed in hospital for every 1270 inhabitants. The hospitals are, however so unequally distributed, that in 68 governments having an aggregate country population of about 76,000,000 there were only 657 hospitals with 8273 beds, and an average of two surgeons to 100,000 inhabitants.

The rate of emigration from the Russian empire is not high. In 1871-80 the average number was 280,700 yearly, and the immigration 285,500. But within the empire itself migration to South Ural, Siberia, and Caucasus goes on extensively; figures, however, even approximate, are wanting. During the ten years 1872-81 no less than 406,180 Germans and 235,600 Austrians immigrated into Russia, chiefly to Poland and the south-western provinces.

A very great diversity of religions, including (besides numerous varieties of Christianity) Mohammedanism, Shamanism, and Buddhism, are found in European Russia, corresponding for the most part with the separate ethnological subdivisions. All Russians, with the exception of a number of White Russians who belong to the Union, profess the Greek Orthodox faith or one or other of the numberless varieties of nonconformity. The Poles and most of the Lithuanians are Roman Catholics. The Esthes and all other Western Finns, the Germans, and the Swedes are Protestant. The Tartars, the Bashkirs, and Kirghizes are Mohammedans; but the last-named have to a great extent maintained along with Mohammedanism their old Shamanism. The same holds good of the Mescheriaks, both Moslem and Christian. The Mordvinians are nearly all Greek Orthodox, as also are the Votiaks, Voguls, Tcheremisses, and Tchuvashes, but their religions are, in reality, very interesting modifications of Shamanism, under the influence of some Christian and Moslem beliefs. The Voguls, though baptized, are in fact fetichists, as much as the unconverted Samoyedes. Finally, the Kalmucks are Buddhist Lamaists.

All these religions are met with in close proximity to one another, and their places of worship often stand side by side in the same town or village without giving rise to religious disturbances. The recent outbreaks against the Jews were directed, not against the Talmudist creed, but against the trading and exploiting community of the "Kahal." In his relations with Moslems, Buddhists, and even fetichists, the Russian peasant looks rather to conduct than to creed, the latter being in his view simply a matter of nationality. Indeed, towards paganism, at least, he is perhaps even more than tolerant, preferring on the whole to keep on good terms with pagan divinities, and in difficult circumstances—especially on travel and in hunting—not failing to present to them his offering. Any idea of proselytism is quite foreign to the ordinary Russian mind, and the outbursts of proselytizing zeal occasionally manifested by the clergy are really due to the desire for "Russification," and traceable to the influence of the higher clergy and of the Government.

The various creeds of European Russia were estimated in 1879 as follows:—Greek Orthodox and Raskolniks, 63,835,000 (about 12,000,000 being Raskolniks); United Greeks and Armenio-Gregorians, 55,000; Roman Catholics, 8,300,000; Protestants, 2,950,000; Jews, 3,000,000; Moslems, 2,600,000; Pagans, 26,000. In 1881 the number of Greek Orthodox throughout the empire, excluding two foreign bishoprics, was estimated at 61,941,000.

Nonconformity (Raskol) is a most important feature of Russian Nonconformal life, and its influence and prevalence have rapidly grown formists, during the last twenty-five years.

When, towards the beginning of the 17th century, the Moscow principality fell under the rule of the Moscow *boiars* (one of whom, Godunoff, reached the throne), they took advantage of the power thus acquired to increase their wealth by a series of measures affecting land-holding and trade; they sanctioned and enforced by law the serfdom which had already from economical causes found its way into Russian life. The great outbreak of 1608-12 weakened their power in favour of that of the czar, but without breaking it; and throughout the reigns of Michael and Alexis the *ukases* were issued in the name of "the czar and boiars." Serfdom was reinforced by a series of laws, and the whole of the 17th century is characterized by a rapid accumulation of wealth in the hands of boiars, by the development of luxury, imported from Poland, and by the struggle of a number of families to acquire the political power already enjoyed by their Polish neighbours. The same tendency

pervaded the church, which was also accused by the people of having introduced "Polish luxury," "Polish creed," and the tendencies towards supremacy of the Polish clergy. The patriarch Nikon was a perfect representative of these tendencies. Opposition resulted, and the revision of the sacred books, which was undertaken by Nikon, gave the opposition acute character. The *Raskol* (*lit.* "splitting" or "schism") made its appearance, and gathered under its banner, not only those who accused Nikon of "Polish" and "Latin" tendencies, but also all those who were for the old customs, for federative and communist principles of social organization, and who revolted against serfdom, centralization, and the suppression of municipal life. A series of insurrections broke out under the banner of the "eight-ends" cross of the *Raskolniks*. Barbarous persecutions by Alexis, Peter I., and their followers did not kill out an opposition which inspired with fanatical enthusiasm the best elements among the Great Russians, and induced its supporters to submit to the fire by thousands at a time, while others rather than submit went to colonize the forests of the Arctic littoral, or betook themselves to Siberia. Profound modifications have taken place in Russian nonconformity since its first appearance. It would be impossible to enumerate them all here, but the following points of primary importance must be mentioned. (1) The mere protest against Nikon's "innovations" (*novshestvas*) led, in the course of two centuries, to a mere servile adherence to the letter of the vernacular Scriptures—even to obvious errors of earlier translators—and to interminable discussions about minor points of ritual and about unintelligible words. (2) Another current which now pervades the whole of Russian nonconformity is that proceeding from rationalist sects which had already spread in north-west Russia in the 16th century, and even in the 14th. These have given rise to several sects which deny the divinity of Christ or explain away various dogmas and prescriptions of orthodoxy. (3) Protestantism, with its more or less rationalistic tendencies, has made itself increasingly felt, especially during the present century and in southern Russia. (4) Hostile critics of the Government, and especially of the autocracy, with its army of officials and its system of conscriptions, passports, and various restrictions on religious liberty, are found more or less in all the nonconforming bodies, which see in these manifestations of authority the appearance of the Antichrist. Several of them refuse accordingly to have any dealings whatever with the official world. (5) Another tendency pervading the whole of Russian nonconformity is that which seeks a return to what are supposed to have been the old communist principles of Christianity in its earlier days. All new sects start with applying these principles to practical life; but in the course of their development they modify them more or less, though always maintaining the principle at least of mutual help. (6) Finally, all sects deal more or less with the question of marriage and the position of woman. A few of them solve it by encouraging,—at least during their "love-feasts,"—absolutely free relations between all "brethren and sisters," while others only admit the dissolubility of marriage or prohibit it altogether. On the whole, leaving the extremer views out of account, the position of woman is undoubtedly higher among the dissenters than among the Orthodox.

These various currents, combining with and counteracting one another in the most complicated ways, have played and continue to play a most important part in Russian history. The mutual assistance found in dissenting sects has preserved many millions of peasants from falling into abject misery, the nonconformists enjoying, as a rule, a greater degree of prosperity than their Orthodox neighbours. The leading feature of Russian history, the spread of the Great Russians over the immense territory they now occupy, cannot be rightly understood without taking into account the colonization of the most inaccessible wildernesses by *Raskolniks*, and the organization of this by their communities, who send delegates for the choice of land and sometimes clear it in common by the united labours of all the young men and cattle of the community. On the other hand, the nonconforming sects, while helping to preserve several advantageous features of Russian life, have had a powerful influence in maintaining, especially among the "Starobryadtsy," the old system of the Moscovite family, subject to the despotic yoke of its chief, and hermetically sealed against instruction.

It is worthy of notice that since the emancipation of the serfs nonconformity has again made a sudden advance, the more radical sects preponderating over the scholastic ones, and the influence of Protestantism being increasingly felt. Nonconformity, which formerly had no hold upon Little Russia (though it had penetrated among Protestant Esthonians and Letts, and even among Moslem Tartars), has suddenly begun to make progress there in the shape of the "Stunda," a mixture of Protestant and rationalistic teaching, with tendencies towards a social but rarely socialistic reformation.

The Russian dissenting sects may be subdivided into (1) the "Popovtsy" (who have priests), (2) the "Bezpopovtsy" (who have none), and (3) numerous spiritualist sects, "Dukhovnye Khristiane." The Popovtsy (5 to 6 millions) are again subdivided into

two classes,—those who recognize the Austrian hierarchy, and those who have only Orthodox "runaway priests" ("Byeglopovotsy"). The latter have recently received unexpected help in the accession of three Orthodox priests of great learning and energy. Moreover, there are among the Popovtsy about a million of "Edinovvertsy," who have received Orthodox priests on the condition of their keeping to the unrevised books. They are patronized by Government.

The Bezpopovtsy embody three large sects—the Pomory, Fedoseevtsy, and Filipovtsy—and a variety of minor ones. They recognize no priests, and repudiate the Orthodox ritual and the sacraments. They avoid all contact with the state, and do not allow prayer for the czar, who is regarded as the Antichrist. They may number about 5,000,000 in west, north, and north-east Russia, and represent, on the whole, an intellectually developed and wealthy population. Of the very numerous smaller sects of Bezpopovtsy, the "Stranniki" (Errants) are worthy of notice. They prefer to lead the life of hunted outcasts rather than hold any relation with the state.

The spiritualists, very numerous in central and southern Russia, are subdivided into a great variety of schools. The "Khlysty," who have their "love-feasts," their "Virgins," sometimes flagellation, and so on, represent a numerous and strong organization in central Russia. The "Skopty" ("Men of God," "Castrati") occur everywhere, even among the Finns, but chiefly in Orel and Kursk, and in towns as money-brokers. The "Dukhobortsy" communities (warriors of the Spirit), chiefly found in the south-east, are renowned as colonizers. They are spreading rapidly in Caucasia and Siberia. The "Molokany" (a kind of Baptists), numbering perhaps about one million, are spread also in the south-east, and are excellent gardeners and tradesmen. Both are quite open to instruction, and have come under the influence of Protestantism, like the "Stunda" in Little Russia and Bessarabia. The "Sabbathers" and the "Skakuny" (a kind of Shakers) are also worthy of notice; while a great variety of new sects, such as the "Nemolyaki" ("who do not pray"), the "Vozdykhateli" ("who sigh"), the "Neplatelschiki" ("who do not pay taxes"), the "Ne-Nashi" (the "Not-ours"), and so on, spring up every year.

The aggregate number of *Raskolniks* is officially stated at nearly one million, but this is quite misleading. The ministry of interior estimated them at 9,000,000 in 1850 and 9,500,000 in 1859. In reality the number is still higher. In Perm alone they were recently computed at a million, and there would be no exaggeration in estimating them at a total of from twelve to fifteen millions.¹

The old subdivisions of the population into orders possessed of Class unequal rights is still maintained. The great mass of the people, divisions 81.6 per cent, belong to the peasant order, the others being—nobility, 1.3 per cent.; clergy, 0.9; the "meschane" or burghers and merchants, 9.3; military, 6.1; foreigners, 0.2; unclassified, 0.5. Thus more than 63 millions of the Russians are peasants. Half of them were formerly serfs (10,447,149 males in 1858),—the remainder being "state peasants" (9,194,891 males in 1858, exclusive of the Archangel government) and "domain peasants" (842,740 males the same year).

The serfdom which had sprung up in Russia in the 16th century, and became consecrated by law in 1609, taking, however, nearly one hundred and fifty years to attain its full growth and assume the forms under which it appeared in the present century, was abolished by law in 1861. This law liberated the serfs from a yoke which was really terrible, even under the best landlords, and from this point of view it was obviously an immense benefit, the results of which are apparent now. But it was far from securing corresponding economic results. Along with the enrichment of the few, a general impoverishment of the great mass followed, and took proportions so alarming as to arouse public attention and to result in a great number of serious investigations conducted by the state, the provincial assemblies, scientific societies, and private statisticians. The general results of these inquiries may be summed up in the subjoined statement.

The former "dvorovye," attached to the personal service of their masters, were merely set free; and they entirely went to reinforce the town proletariat. The peasants proper received their houses and orchards, and also allotments of arable land. These allotments were given over to the rural commune (*mir*), which was made responsible, as a whole, for the payment of taxes for the allotments. The size of the allotments was determined by a maximum and by a minimum, which last, however, could be still further reduced if the amount of land remaining in the landlord's hands was less than one half of what was allotted to the peasants. For these allotments the peasants had to pay, as before, either by personal labour (twenty to forty men's days and fifteen to thirty women's days per year), or by a fixed rent ("obrok"), which varied from 8 to 12 roubles per allotment. As long as these relations subsisted, the peasants were considered as "temporarily obliged" (*vremennno obyazannyye*). On January 1, 1882, they still numbered

¹ See Schapoff on *Russian Raskol*; *Sbornik of State Regulations against the Raskolniks*; and very many papers printed in reviews, chiefly in *Otch. Zapiski, Dyeto, Vystupki Evrope*, &c., by Schapoff, Yuzoff, Prugarin, Rozoff, &c.

1,422,012 males; but this category is now disappearing in consequence of a recent law (December 23, 1881).

The allotments could be redeemed by the peasants with the help of the crown, and then the peasants were freed from all obligations to the landlord. The crown paid the landlord in obligations representing the capitalized "obrok," and the peasants had to pay the crown, for forty-nine years, 6 per cent. interest on this capital, that is, 9 to 12 roubles per allotment. If the redemption was made without the consent of the peasants—on a mere demand of the landlord, or in consequence of his being in arrear for the payment of his debts to the nobility hypothec bank—the value of the redemption was reduced by one-fifth. The redemption was not calculated on the value of the allotments, but was considered as a compensation for the loss of the compulsory labour of the serfs; so that throughout Russia, with the exception of a few provinces in the south-east, it was—and still remains notwithstanding a very great increase of the value of land—much higher than the market value of the allotment. Moreover, taking advantage of the maximum law, many proprietors cut away large parts of the allotments the peasants possessed under serfdom, and precisely the parts the peasants were most in need of, namely, pasture lands around their houses, and forests. On the whole, the tendency was to give the allotments so as to deprive the peasants of grazing land and thus to compel them to rent pasture lands from the landlord at any price.

The present condition of the peasants—according to official documents—appears to be as follows. In the twelve central governments the peasants, on the average, have their own rye-bread for only 200 days per year,—often for only 180 and 100 days. One quarter of them have received allotments of only 2·9 acres per male, and one half less than 8·5 to 11·4 acres,—the normal size of the allotment necessary to the subsistence of a family under the three-fields system being estimated at 28 to 42 acres. Land must be thus rented from the landlords at fabulous prices. Cattle-breeding is diminishing to an alarming degree. The average redemption is 8·56 roubles (about 17s.) for such allotments, and the smaller the allotment the heavier the payment, its first "dessiatina" (2·86 acres) costing twice as much as the second, and four times as much as the third. In all these governments, the state commission testifies, there are whole districts where one-third of the peasants have received allotments of only 2·9 to 5·8 acres. The aggregate value of the redemption and land-taxes often reaches from 185 to 275 per cent. of the normal rental value of the allotments, not to speak of taxes for recruiting purposes, the church, roads, local administration, and so on, chiefly levied from peasants. The arrears increase every year; one-fifth of the inhabitants have left their houses; cattle are disappearing. Every year more than half the adult males (in some districts three-fourths of the men and one-third of the women) leave their homes and wander throughout Russia in search of labour. The state peasants are only a little better off.

Such is the state of affairs in central Russia, and it would be useless to multiply figures, repeating nearly the same details. In the eight governments of the black-earth region the state of matters is hardly better. Many peasants took the "gratuitous allotments," whose amount was about one-eighth of the normal ones.

The average allotment in Kherson is now only 0·90 acre, and for allotments from 2·9 to 5·8 acres they pay from 5 to 10 roubles of redemption tax. The state peasants are better off, but still they are emigrating in masses. It is only in the Steppe governments that the situation is more hopeful. In Little Russia, where the allotments were personal (the *mir* existing only among state peasants), the state of affairs does not differ for the better on account of the high redemption taxes. In the western provinces, where the land was valued cheaper and the allotments somewhat increased after the Polish insurrection, the general situation might be better were it not for the former misery of peasants. Finally, in the Baltic provinces nearly all the land belongs to German landlords, who either carry on agriculture themselves, with hired labourers, or rent their land as small farms. Only one-fourth of the peasants are farmers, the remainder being mere labourers, who are emigrating in great numbers.

The situation of the former serf-proprietors is also unsatisfactory. Accustomed to the use of compulsory labour, they have failed to accommodate themselves to the new conditions. The 700,000,000 roubles of redemption money received from the crown down to 1877 by 71,000 landed proprietors in Russia have been spent without accomplishing any agricultural improvement. The forests have been sold, and only those landlords are prospering who exact rack-rents for the land without which the peasants could not live upon their allotments.

As showing a better aspect of the situation it must be added that in eighty-five districts of Russia the peasants have bought 5,349,000 acres of land since 1861. But these are mostly village-traders and grain-lenders (*kulaks*). A real exception can be made only for Tver, where 53,474 householders united in communities have bought 633,240 acres of land. There has been an increase of

wealth among the few, but along with this a general impoverishment of the mass of the people.¹

The ancient Scandinavians described Russia as *Gårdariki*,—the The country of towns,—and until now Great Russia has maintained village this character. The dwellings of the peasantry are not scattered communities over the face of the country, but aggregated in villages, where they are built in a street or streets. This grouping in villages has its origin in the bonds which unite the peasants in the village community—the *mir*, or the *obshchina*.

When Haxthausen first described the Great Russian *mir*, it was considered a peculiarity of the Slavonian race,—a view which is no longer tenable. The *mir* is the Great Russian equivalent for the German, Dutch, and Swiss "mark" or "allmend," the English "township," the French "commune," the Polish "gmina," the South Slavonian "zadruga," the Finnish "pittäy," &c.; and it very nearly approaches, though differing from them in some essential features, the forms of possession of land prevailing among the Moslem Turco-Tartars, while the same principle is found even among the Mongol Buriat shepherds and the Tungus hunters.

The following are the leading features of the organization of the *mir* among the Great Russians.

The whole of the land occupied by a village—whoever be the landlord recognized by law—the state, a private person, or a juridical unity, such as the *voisko* of the Cossacks—is considered as belonging to the village community as a whole, the separate members of the community having only the right of temporary possession of such part of the common property as will be allowed to them by the *mir* in proportion to their working power. To this right corresponds the obligation of bearing an adequate part of the charges which may fall upon the community. If any produce results from the common work of the community, each member has a right to an equal part of it.

According to these general principles, the arable land is divided into as many lots as there are working units in the community, and each family receives as many lots as it has working units. The unit is usually one male adult; but, when the working power of a large family is increased by its containing a number of adult women, or boys approaching adult age, this circumstance is taken into account, as well as the diminution from any cause of working power in other households.

For dividing the arable land into lots, the whole is parted first into three "fields," according to the three-field rotation of crops. As each field, however, contains land of various qualities, it is in its turn subdivided into, say, three parts—of good, average, and poor quality; and each of these parts is subdivided into as many lots as there are working units. Each household receives its lots in each of the subdivisions of the "field," a carefully minute equalization as to the minor differences between the lots being aimed at; and the partition is nearly always made so as to permit each household to reach his allotment without passing through that of another.

To facilitate this division, the community divides, first, into smaller groups (*vyt, zhorebyetka*, a "ten," an "eight," &c.), each of which is composed, by free selection, of a number of householders—the community only taking care that each shall not be composed of rich, of poor, or of "turbulents" exclusively. The division of the land is first made among such groups, and the subdivision goes on within these. The division into groups facilitates also the distribution of such work as the community may have to accomplish—as when a bridge or a ditch has to be repaired, or a meadow mowed—and the work cannot be done by the community as a whole.

As sickness, death, removal, and other incidents bring about changes in the distribution of working power among the different households, or when the number of working units in the community has increased or decreased, a redistribution of land (*peredyl*) follows. Whether the land be a burden (the taxes exceeding its rental value) or a benefit, its division is equalized; the households whose working power has increased receive additional lots, and *vice versa*. The *peredyl* may be "partial" or "general." In most cases a mere equalization of lots among several families will serve, and a general redistribution is resorted to only when greater inequalities have arisen. On the whole, these redistributions are rare, and the precariousness of landholding which has been supposed to be a consequence of the *mir* proves to have been exaggerated. More detailed inquiries have

¹ See Yanson's *Researches on Allotments and Payments* (2d ed., 1881) and *Comparative Statistics of Russia* (vol. II.); *Statistics of Landed Property*, published by Central Statistical Committee; works of the Committee on Taxation, and those of the Committee of Inquiry into Petty Trades (12 vols.); *Reports of the Commission on Agriculture*; *Collection of Materials on the Village Community* (vol. I.); *Collection of Materials on Landholding, and Statistical Descriptions of Separate Governments*, published by several zemstvos (Moscow, Tver, Nijni, Tula, Ryazani, Tamboff, Pskov, Saratoff, &c.); Kawelin, *The Peasant Question*; Vasilchikoff, *Land Property and Agriculture* (2 vols.), and *Village Life and Agriculture*; Ivanukoff, *The Fall of Serfdom in Russia*; Shashkoff, "Peasantry in the Baltic Provinces," in *Russkaya Mysl*, 1883, III. and IX.; V. V. Agric. *Sketches of Russia*; Golovatchoff, *Capital and Peasant Farming*; Engelhardt's *Letters from the Country*; many elaborate papers in reviews (all Russian); and Appendix to Russian translation of Reclus's *Géogr. Univ*

shown that no redistribution is made without urgent necessity. Thus, to quote but one instance, in 4442 village communities of Moscow, the average number of redistributions has been 2.1 in twenty years (1858-78), and in more than two-thirds of these communities the redistribution took place only once. On the other hand, a regular rotation of all households over all lots, in order to equalize the remaining minor inequalities, is very often practised in the black-earth region, where no manure is needed.

Besides the arable mark, there is usually a *vygon* (or "common") for grazing, to which all householders send their cattle, whatever the number they possess. The meadows are either divided on the above principles, or mowed in common, and the hay divided according to the number of lots. The forests, when consisting of small wood in sufficient quantity, are laid under no regulations; when this is scarce, every trunk is counted, and valued according to its age, number of branches, &c., and the whole is divided according to the number of lots.

The houses and the orchards behind them belong also, in principle, to the community; but no *peredel* is made, except after a fire or when the necessity arises of building the houses at greater distances apart. The orchards usually remain for years in the same hands, with but slow equalizations of the lots in width.

All decisions in the village community are given by the *mir*, that is, by the general assembly of all householders,—women being admitted on an equal footing with men, when widows, or when their male guardians are absent. For the decisions unanimity is necessary; and, though in some difficult cases of a general *peredel* the discussions may last for two or three days, no decision is reached until the minority has declared its agreement with the majority.

Each commune elects an elder (*starosta*); he is the executive, but has no authority apart from that of the *mir* whose decisions he carries out. All attempts on the part of the Government to make him a functionary have failed.

Opinion as to the advantages and disadvantages of the village community being much divided in Russia, it has been within the last twenty years the subject of extensive inquiry, both private and official, and of an ever-growing literature and polemic. The supporters of the *mir* are found chiefly among those who have made more or less extensive inquiries into its actual organization and consequences, while their opponents draw their arguments principally from theoretical considerations of political economy. The main reproach that it checks individual development and is a source of immobility has been shaken of late by a better knowledge of the institution, which has brought to light its remarkable plasticity and power of adaptation to new circumstances. The free settlers in Siberia have voluntarily introduced the same organization. In north and north-east Russia, where arable land is scattered in small patches among forests, communities of several villages, or "volost" communities, have arisen; and in the "voisko" of the Ural Cossacks we find community of the whole territory as regards both land and fisheries and work in common. Nay, the German colonists of southern Russia, who set out with the principle of personal property, have subsequently introduced that of the village community, adapted to their special needs (Clausen). In some localities, where there was no great scarcity of land and the authorities did not interfere, joint cultivation of a common area for filling the storehouses has recently been developed (in Penza 974 communes have introduced this system and cultivate an aggregate of 26,910 acres). The renting of land in common, or even purchase of land by wealthy communes, has become quite usual, as also the purchase in common of agricultural implements.

Since the emancipation of the serfs, however, the *mir* has been undergoing profound modifications. The differences of wealth which ensued,—the impoverishment of the mass, the rapid increase of the rural proletariat, and the enrichment of a few "kulaks" and "miroyedes" ("mir-eaters"),—are certainly operating unfavourably for the *mir*. The *miroyedes* steadily strive to break up the organization of the commune as an obstacle to the extension of their power over the moderately well-to-do peasants; while the proletariat cares little about the *mir*. Fears on the one side and hopes on the other have been thus entertained as to the likelihood of the *mir* resisting these disintegrating influences, favoured, moreover, by those landowners and manufacturers who foresee in the creation of a rural proletariat the certainty of cheap labour. But the village community does not appear as yet to have lost the power of adaptation which it has exhibited throughout its history. If, indeed, the impoverishment of the peasants continues to go on, and legislation also interferes with the *mir*, it must of course disappear, but not without a corresponding disturbance in Russian life.

"Artels." The co-operative spirit of the Great Russians shows itself further

in another sphere in the *artels*, which have also been a prominent feature of Russian life since the dawn of history. The *artel* very much resembles the co-operative society of western Europe, with this difference that it makes its appearance without any impulse from theory, simply as a natural form of popular life. When workmen from any province come, for instance, to St Petersburg to engage in the textile industries, or to work as carpenters, masons, &c., they immediately unite in groups of from ten to fifty persons, settle in a house together, keep a common table, and pay each his part of the expense to the elected elder of the *artel*. All Russia is covered with such *artels*,—in the cities, in the forests, on the banks of rivers, on journeys, and even in the prisons.

The industrial *artel* is almost as frequent as the preceding, in all those trades which admit of it. A social history of the most fundamental state of Russian society would be a history of their hunting, fishing, shipping, trading, building, exploring *artels*. *Artels* of one or two hundred carpenters, bricklayers, &c., are common wherever new buildings have to be erected, or railways or bridges made; the contractors always prefer to deal with an *artel*, rather than with separate workmen. The same principles are often put into practice in the domestic trades. It is needless to add that the wages divided by the *artels* are higher than those earned by isolated workmen.

Finally, a great number of *artels* on the stock exchange, in the seaports, in the great cities (commissionaires), during the great fairs, and on railways have grown up of late, and have acquired the confidence of tradespeople to such an extent that considerable sums of money and complicated banking operations are frequently handed over to an *artelshik* (member of an *artel*) without any receipt, his number or his name being accepted as sufficient guarantee. These *artels* are recruited only on personal acquaintance with the candidates for membership, and security reaching £80 to £100 is exacted in the exchange *artels*. These last have a tendency to become mere joint-stock companies employing salaried servants. Co-operative societies have lately been organized by several *zemstvos*. They have achieved good results, but do not exhibit, on the whole, the same unity of organization as those which have arisen in a natural way among peasants and artisans.²

The chief occupation of the population of Russia is agriculture. Agriculture in a few parts of Moscow, Vladimir, and Nijni has been abandoned for manufacturing pursuits. Cattle-breeding is the leading industry in the Steppe region, the timber-trade in the north-east, and fishing on the White and Caspian Seas. Of the total surface of Russia, 1,237,360,000 acres (excluding Finland), 1,018,737,000 acres are registered, and it appears that 39.9 per cent. of these belongs to the crown, 1.9 to the domains (*udel*), 31.2 to peasants, 24.7 to landed proprietors or to private companies, and 2.3 to the towns and monasteries. Of the acres registered only 592,650,000 can be considered as "good," that is, capable of paying the land tax; and of these 248,630,000 acres were under crops in 1884.³ The crops of 1883 were those of an average year, that is, 2.9 to 1 in central Russia, and 4 to 1 in south Russia, and were estimated as follows (seed corn being left out of account):—Rye, 49,185,000 quarters; wheat, 21,605,000; oats, 50,408,000; barley, 13,476,000; other grains, 18,808,000. Those of 1884 (a very good year) reached an average of 18 per cent. higher, except oats. The crops are, however, very unequally distributed. In an average year there are 8 governments which are some 6,930,000 quarters short of their requirements, 35 which have an excess of 33,770,000 quarters, and 17 which have neither excess nor deficiency. The export of corn from Russia is steadily increasing, having risen from 6,560,000 quarters in 1856-60 to an average of 23,700,000 quarters in 1876-83 and 26,623,700 quarters in 1884. This increase does not prove, however, an excess of corn, for even when one-third of Russia was famine-stricken, during the last years of scarcity, the export trade did not decline; even Samara exported during the last famine there, the peasants being compelled to sell their corn in autumn to pay their taxes. Scarcity is quite usual, the food supply of some ten provinces being exhausted every year by the end of the spring. Orach, and even bark, are then mixed with flour for making bread.

Flax, both for yarn and seed, is extensively grown in the north-west and west, and the annual production is estimated at 6,400,000 cwts. of fibre and 2,900,000 quarters of linseed. Hemp is largely cultivated in the central governments, the yearly production being

² See Iseff on *Artels in Russia*, and in Appendix to Russian translation of Reclus; Kalatchoff, *The Artels of Old and New Russia*; *Recueil of Materials on Artels* (2 vols.); Scherbina, *South Russian Artels*; Nemiroff, *Stock Exchange Artels* (all Russian).
³ The division of the registered land is as follows, the figures being percentages of the whole:—

	Arable Land.	Forests.	Meadows, Pasture.	Unproductive.
Peasants' holdings.....	53.8	10.1	26.6	9.5
Private holdings.....	27.2	37.6	23.1	11.9
Crown and domains.....	1.7	64.8	1.6	32.4
Total.....	26.3	88.7	15.9	19.1

¹ See *Collection of Materials on Village Communities*, published by the Geographical and Economical Societies, vol. I. (containing a complete bibliography up to 1880). Of more recent works the following are worthy of notice:—Lutichitsky, *Collection of Materials for the History of the Village Community in the Ukraine*, Kieff, 1884; Efimenko, *Researches into Popular Life*, 1884; Hantower, *On the Origin of the Cossack Possession*, 1884; Samokvasoff, *History of Russian Law*, 1884; Kousler, *Zur Geschichte und Kritik des bäuerlichen Gemeinde-Bestzes in Russland*, 2 vols., 1884; and papers in publications of Geographical Society.

1,800,000 cwts. of fibre and 1,800,000 quarters of seed. The export of both (which along with other oil-bearing plants reached the value of 186,816,000 roubles in 1882) holds the second place in the foreign trade of Russia.

The culture of the beet is increasing, and in 1884 785,700 acres were under this root, chiefly in Little Russia and the neighbouring governments; 68,900,000 cwts. of beetroot were worked up, yielding 5,119,000 cwts. of sugar, while fifty-five refineries (twenty-six of them in Poland) showed a production valued at 118,888,530 roubles in 1882. Tobacco is cultivated everywhere, but good qualities are obtained only in the south. In 1876-80 an average area of 101,600 acres was under this steadily increasing culture, and the crop of 1884 yielded 86,400,000 cwts. The vine, which might be grown much farther north than at present, is cultivated only on Mount Caucasus, in Bessarabia, in the Crimea, and on the lower Don for wine, and in Ekaterinoslav, Podolia, and Astrakhan for raisins. The yearly produce is 10·8 million gallons in Russia, 10·0 in the Caucasus, and 24 in Transcaucasia.

Market gardening is extensively carried on in Yaroslavl for a variety of vegetables for exportation, in Moscow and Ryazan for hops, and in the south for sunflowers, poppies, melons, &c. Gardening is also widely spread in Little Russia and in the more fertile central governments. Madder and indigo are cultivated on Caucasus, and the silk-worm in Taurida, Kherson, and Caucasia. Bee-keeping is widely spread.

The breeding of live stock is largely carried on in the east and south, but the breeds are usually inferior. Good breeds of cattle are met with only in the Baltic provinces, and excellent breeds of horses on the Don, in Tamboff, and in Voronezh. Since the emancipation, the peasants have been compelled to reduce the number of their cattle, so that the increase in this department does not correspond to the increase of population, as is shown by the following figures:—

	1851.	1882.
Cattle.....	20,962,000	23,845,100
Sheep.....	37,527,000	47,508,970
Swine.....	8,886,000	9,207,670

A more thorough registration of horses for military purposes gives a return of 21,203,900 horses in Russia and Poland, that is, 255 horses per 1000 inhabitants—a proportion which is elsewhere approached only in the United States. They are kept in largest numbers in the three Steppe governments and on the Urals (550 and 384 per 1000 inhabitants), while the smallest proportion occurs in the manufacturing region (155 per 1000 inhabitants). 90 per cent. of the total number of horses belong to peasants; these are mostly of a very poor description. Infectious diseases make great ravages every year. In 1882 no less than 121,500 cattle and 14,110 horses perished from that cause.¹

Fishing. Fishing is a most important source of income for whole communities in Russia. No less than 2000 to 3000 inhabitants of Archangel are engaged in fishing on the Norwegian coast and in the White Sea, the aggregate yield of this industry being estimated at 200,000 cwts., including 150 million herrings. These fisheries are, however, declining. Fishing in the Baltic is not of much importance. In the estuaries of the Dnieper, Dniester, and Bug it gives occupation to about 4000 men, and may be valued at less than 1,000,000 roubles. The fisheries in the Sea of Azoff, which occupy about 15,000 men, are much more important, as are also those of the lower Don, which last alone are valued at over 1,000,000 roubles a year. The chief fisheries of Russia are, however, on the Caspian and in its feeders: those of the Volga cover no less than 6000 square miles, and those of the Ural extend for over 100 miles on the sea-coast and 400 miles up the river. The lowest estimates give no less than 4 million cwts., valued at 15 million roubles, of fish taken every year in the Caspian and its affluents. The fisheries on the lakes of the lake region are also worthy of notice.

Hunting. Hunting is an important source of income in north and north-east Russia, no less than 400,000 squirrels and 800,000 grouse, to mention no other game, being killed in different governments, while sea-hunting is still productive on the shores of the Arctic Ocean.²

Mining and related industries. Notwithstanding the wealth of the country in minerals and metals of all kinds, and the endeavours made by Government to encourage mining, including the imposition of protective tariffs even against Finland (in 1885), this and the related industries are still at a low stage of development. The remoteness of the mining from the industrial centres, the want of technical instruction and also of capital, and the existence of a variety of vexatious

regulations may be given as the chief reasons for this state of matters. The imports of foreign metals in the rough and of coal are steadily increasing, while the exports, never otherwise than insignificant, show no advance. The chief mining districts of Russia are the Ural Mountains and Olonetz for all kinds of metals; the Moscow and Donetz basins for coal and iron; Poland and Finland; Caucasus; and the Altai, the Nertchinsk, and the Amur mountains.

Gold is obtained from gold-washings in Siberia (63,194 lb in 1882), the Urals (16,850 lb), Central Asia (325 lb in 1881), and Finland (42 lb); silver in Siberia (16,128 lb), and partly on Caucasus (1292 lb), the quantity steadily decreasing; platinum in the Urals (3600 to 4600 lb every year). Lead is extracted along with silver (19,416 cwts. in 1881; 357,260 cwts. imported); zinc only in Poland (89,650 cwts.; half as much is imported); tin in Finland (194 cwts.; 40,000 cwts. imported). Copper is worked in several governments of the Ural region, in Kazan, Vyatka, Caucasus, Siberia, and Finland, but the industry is a languishing one, and the crown mines show a deficit (65,000 cwts.; double this amount is imported). Iron-ores are found at many places. Excellent mines are worked on the Urals; and iron mines occur also in large numbers throughout the Moscow and Donetz basins, as also in the western provinces, not to speak of those of the Asiatic dominions, of Poland, and of Finland (bog-iron). In 1881 the annual production of pig-iron (which covered only two-thirds of the consumption) was stated as follows, (in thousands of cwts.):—Urals, 6153; central Russia, 1092; Olonetz, 42; south and south-west Russia, 501; Poland, 951; Finland, 413; Siberia, 85. The iron and steel throughout the empire amounted to 10,720,000 cwts. in 1882. European Russia alone produced in 1882 31,520 cwts. of copper, 7,708,000 cwts. of pig-iron, 4,981,300 cwts. of iron, and 3,799,600 cwts. of steel.

The production of coal is rapidly increasing and in 1882 reached 46,270,000 cwts., three-fourths being produced by the Donetz basin, and one-fifth by that of Moscow. Poland, moreover, yielded 27,950,000 cwts. of coal in 1882, and the Asiatic dominions about 800,000 cwts. Nearly 34,000,000 cwts. are imported annually. The extraction of naphtha on the Apsheron peninsula of the Caspian has been greatly stimulated of late, reaching about 20,000,000 cwts. in 1883 (4,600,000 cwts. of kerosene, 1,000,000 cwts. of lubricating oils, and 300,000 cwts. of asphalt).

Russia and Siberia are very rich in rock-salt, salt springs, and salt lakes (16,360,000 cwts. extracted; 3,746,000 imported). Excellent graphite is found in the deserts of the Sayan Mountains and Turukhansk. Sulphur is obtained in Caucasia, Kazan, and Poland (2000 to 5000 cwts. extracted; 70,000 to 170,000 cwts. imported). The mining and related industries occupy altogether about an aggregate motive force (steam and water) of 73,500 horse-power and 305,000 hands.³

Since the time of Peter I. the Russian Government has been manufacturing in its efforts for the creation and development of home manufactures. Important monopolies in last century, and heavy and petty protective, or rather prohibitive, import duties, as well as large industries money bounties, in the present, have contributed towards the accumulation of immense private fortunes, but manufactures have developed but slowly. A great upward movement has, however, been observable since 1863. About that time a thorough reform of the machinery in use was effected, whereby the number of hands employed was reduced, but the yearly production doubled or trebled. In some branches the production suddenly rose at a yet higher rate (cottons from 12 million roubles in 1865 to 209 million in 1882). The following figures for European Russia, without Poland and Finland, will give some idea of this progress:—

	Number of Establishments.	Workmen Employed.	Yearly Production in Roubles.	Production per Workman.
1851	9,256	456,596	157,372,000	317
1861	14,060	559,533	295,560,000	528
1870	18,892	463,093	452,660,000	977
1882	56,905	954,971	1,126,033,000	1,187

These figures lose, however, some of their significance if the corresponding rate of progress in manufacturing productivity in western Europe be taken into account. Besides, since the great improvements of 1861-70 the industrial progress of Russia has been but slow. The manufactories of rails and railway plant, and even the Ural iron-works, are in a precarious condition. The textile industries, though undoubtedly they have made great advances, are subject to great fluctuations in connexion with those of the home crops, and are thus in an abnormal state. The artisans labour for twelve, fourteen, and sometimes sixteen hours a day, and their condition, as revealed by recent inquiries, is very unsatisfactory. Many causes contribute to this,—the want of technical instruction, the want of capital, and

¹ See *The Year 1884 with regard to Agriculture*, published by the Ministry of Interior (so also preceding years); the publications of the Minister of Finance; Yanson's *Comparative Statistics of Russia*, 1880; Appendix to Russian translation of Reclus; and Suvorin's *Russky Kalendár*.

³ See the yearly accounts in *Mining Journal*; Dobronizskiy, *Mining in the Russian Exhibition of 1883* (detailed account); publications of the Minister of Finance; Köppen's "Mining Industry of Russia," in *Mining Journal*, 1880, and *Izvestia Geog. Soc.*, 1880; Marlin's *Petroleum Industry of Russia*, 1885.

above all the want of markets. Russia has not, and cannot have, such foreign markets as the countries which first attained an industrial development. Her colonies are deserts, and in the home markets the manufacturer only finds 30 millions of poverty-stricken people, whose wants are nearly all supplied by their petty domestic industries.

These, that is, the domestic industries which are carried on by the peasants in conjunction with their agricultural pursuits during the long days of idleness imposed by the climate and by the reduced allotments of land, continue, not only to hold their ground side by side with the large manufactures, but to develop and to compete with these by the cheapness of their products. Extensive inquiries are now being made into these domestic industries (*kustarnoye proizvodstvo*). 855,000 persons engaged in them along with agriculture (*kustari*) have already been registered, and an unexpected variety of industries, and a still more unexpected technical development in several of them, have been disclosed by these researches. The yearly production of the 855,000 *kustari* who have been registered reaches 218,444,000 roubles; while the total number of peasants engaged in the industries, mostly in Great Russia and northern Caucasia, is estimated at a minimum of 7,500,000 persons, with a yearly production of at least 1,800,000,000 roubles, or more than double the aggregate production of the manufactures proper.

Of course the machinery they use is very primitive, and the wages for a day of twelve to sixteen hours exceedingly low. But the industries are capable of being improved, and it has been brought out that "Paris" silk hats and "Vienna" house furniture sold by substantial foreign firms at Moscow are really manufactured in the neighbourhood of the capital by peasants who still continue to till their fields. All these industries suffer very much from want of credit, and the producers become the prey of intermediaries. But their continued existence and their progress under most unfavourable conditions show that they meet a real want, which is itself the consequence of the peculiar conditions under which Russia, the last to come into the international market, has to develop.

In those very governments where two-thirds of the textile manufactures of Russia are concentrated domestic weaving (for the market, not for domestic use) employs about 200,000 hands, whose yearly production is valued at 45,000,000 roubles. In Stavropol on Caucasus it has so rapidly developed that 42,400 looms are now at work, with a yearly production of 2,007,700 roubles. But no adequate idea could be given of the petty industries of Russia without entering into greater detail than the scope of the present article permits. Suffice it to say that there is no branch of the industries in textiles, leather, woodwork, or metal work, provided it needs no heavy machinery, which is not successfully carried on in the villages. Nearly all the requirements of nine-tenths of the population of Russia are met in this way.

The aggregate production of industries within the empire, inclusive of mining, was stated in 1882 as follows:—European Russia, 1,126,033,000 roubles; Poland, 147,309,000; Finland, 15,130,000. The chief manufactures in European Russia (apart from Poland and Finland), and their yearly production in 1882 in millions of roubles, were as follows:—cotton yarn and cottons, 208·6; other textile industries, 103·5; metal wares and machinery, 107·9; chemicals, 6·6; candles, soap, glue, leather, and other animal products, 61·4; distillery products, 156·0; other liquors, 39·0; sugar, 140·9; flour, 74·0. The remainder are of minor importance. It must be observed, however, that these figures are much below those given for 1879, when the aggregate production of Russian manufactures was computed at 1,102,949,000 roubles, without the mining and related industries, the distillery products, and the flour.

The geographical distribution of manufactures in Russia is very unequal. The governments of Moscow and St Petersburg, with a yearly production of 173 and 134 million roubles respectively, represent together two-fifths of the aggregate production of Russia.¹ If we add Vladimir (91,766,000 roubles), Kieff (73,800,000), Perm (50,500,000), Livonia, Esthonia, Kharkoff, and Kherson (from 30 to 35 millions each), we have all the principal manufacturing centres. In fact, Moscow, with portions of the neighbouring governments, contains half the Russian manufactures exempted from excise duties, while the south-west governments of Kieff, Podolia, and Kherson contain two-thirds of those not so exempted.²

The main wealth of Russia consisting in raw produce, the trade of the country turns chiefly on the purchase of this for export, and the sale of manufactured and imported goods in exchange. This

traffic is in the hands of a great number of middlemen,—in the west Jews, and elsewhere Russians,—to whom the peasants are for the most part in debt, as they purchase in advance on security of subsequent payments in corn, tar, wooden wares, &c. A good deal of the internal trade is carried on by travelling merchants (*ofeni*).

The fairs are very numerous; the minor ones numbered 6500 in 1878, and showed sales amounting to an aggregate of 305 million roubles. Those of Nijni-Novgorod, with a return of 400 million roubles, of Irbit and Kharkoff (above 100 million roubles each), of Romny, Krestovskoye in Perm, and Menzelinsk in Ufa (55 to 12 million roubles), have considerable importance both for trade and for home manufactures. The total value of the internal trade, which is in the hands of 681,116 licensed dealers, is roughly estimated at more than seven milliards of roubles.

The development of the external trade of Russia is seen from the following figures (millions of roubles):—

	1861-65.	1866-70.	1871-75.	1876-80.	1881.	1882.
<i>Exports.</i>						
Articles of food.....	66·1	116·9	200·1	326·2	261·9	350·6

„ in metallic roubles ²	158·4	214·4	319·2	342·3	336·8	370·6
<i>Imports.</i>						
Articles of food.....	60·4	68·5	109·3	122·0	125·7	148·2
Raw and half-manufactured produce.	66·4	116·9	208·4	259·7	278·5	284·7
Manufactured wares	36·1	96·4	132·2	139·2	113·6	135·1
Total	162·9	281·8	449·9	520·9	517·8	568·0
„ in metallic roubles...	142·5	229·3	390·3	359·4	344·3	340·8

The chief article of export is grain—wheat, oats, and rye—(24,870,000 quarters, 321,042,000 roubles in 1882), to which the increase of exports is mainly due. This increase, however, does not correspond to an increase of crops, only 10 per cent. of which were exported in 1870 and about 20 per cent. in 1882. Next to grain come flax, hemp, linseed, and hempseed (129,370,000 roubles in 1882); oil-yielding grains (441,000 quarters); wool, tallow, hides, bristles, and bone (31,120,000 roubles). If we add to these timber (35,044,000 roubles) and furs (4,147,000 roubles), 95 per cent. of all Russian exports are accounted for, the remainder consisting of linen, ropes, and some woollen stuffs and metallic wares (7,172,000 roubles to western Europe, 2,888,000 to Finland, and 5,763,000 to Asia).

The chief imports from Europe were in 1882 as follows:—Tea (48,091,000 roubles), liquors (16,124,000 roubles), salt, fish, rice, fruits, and colonial wares (38,446,000 roubles), various raw textile wares (127,986,000 roubles—cotton 72,417,000), raw metals (32,630,000 roubles), chemicals (57,894,000 roubles), and stuffs (22,428,000 roubles). The imports from Asia—chiefly tea—in the same year reached 32,853,000 roubles. The chief imports were from Germany (214,000,000 roubles) and Great Britain (124,700,000), the chief exports to Great Britain (210,000,000), Germany (178,000,000), and France (54,000,000). Even in her trade with Finland Russia imports more than she exports,—the chief imports being paper, cotton, iron, and butter; prohibitory tariffs were imposed on Finnish wares in 1885.

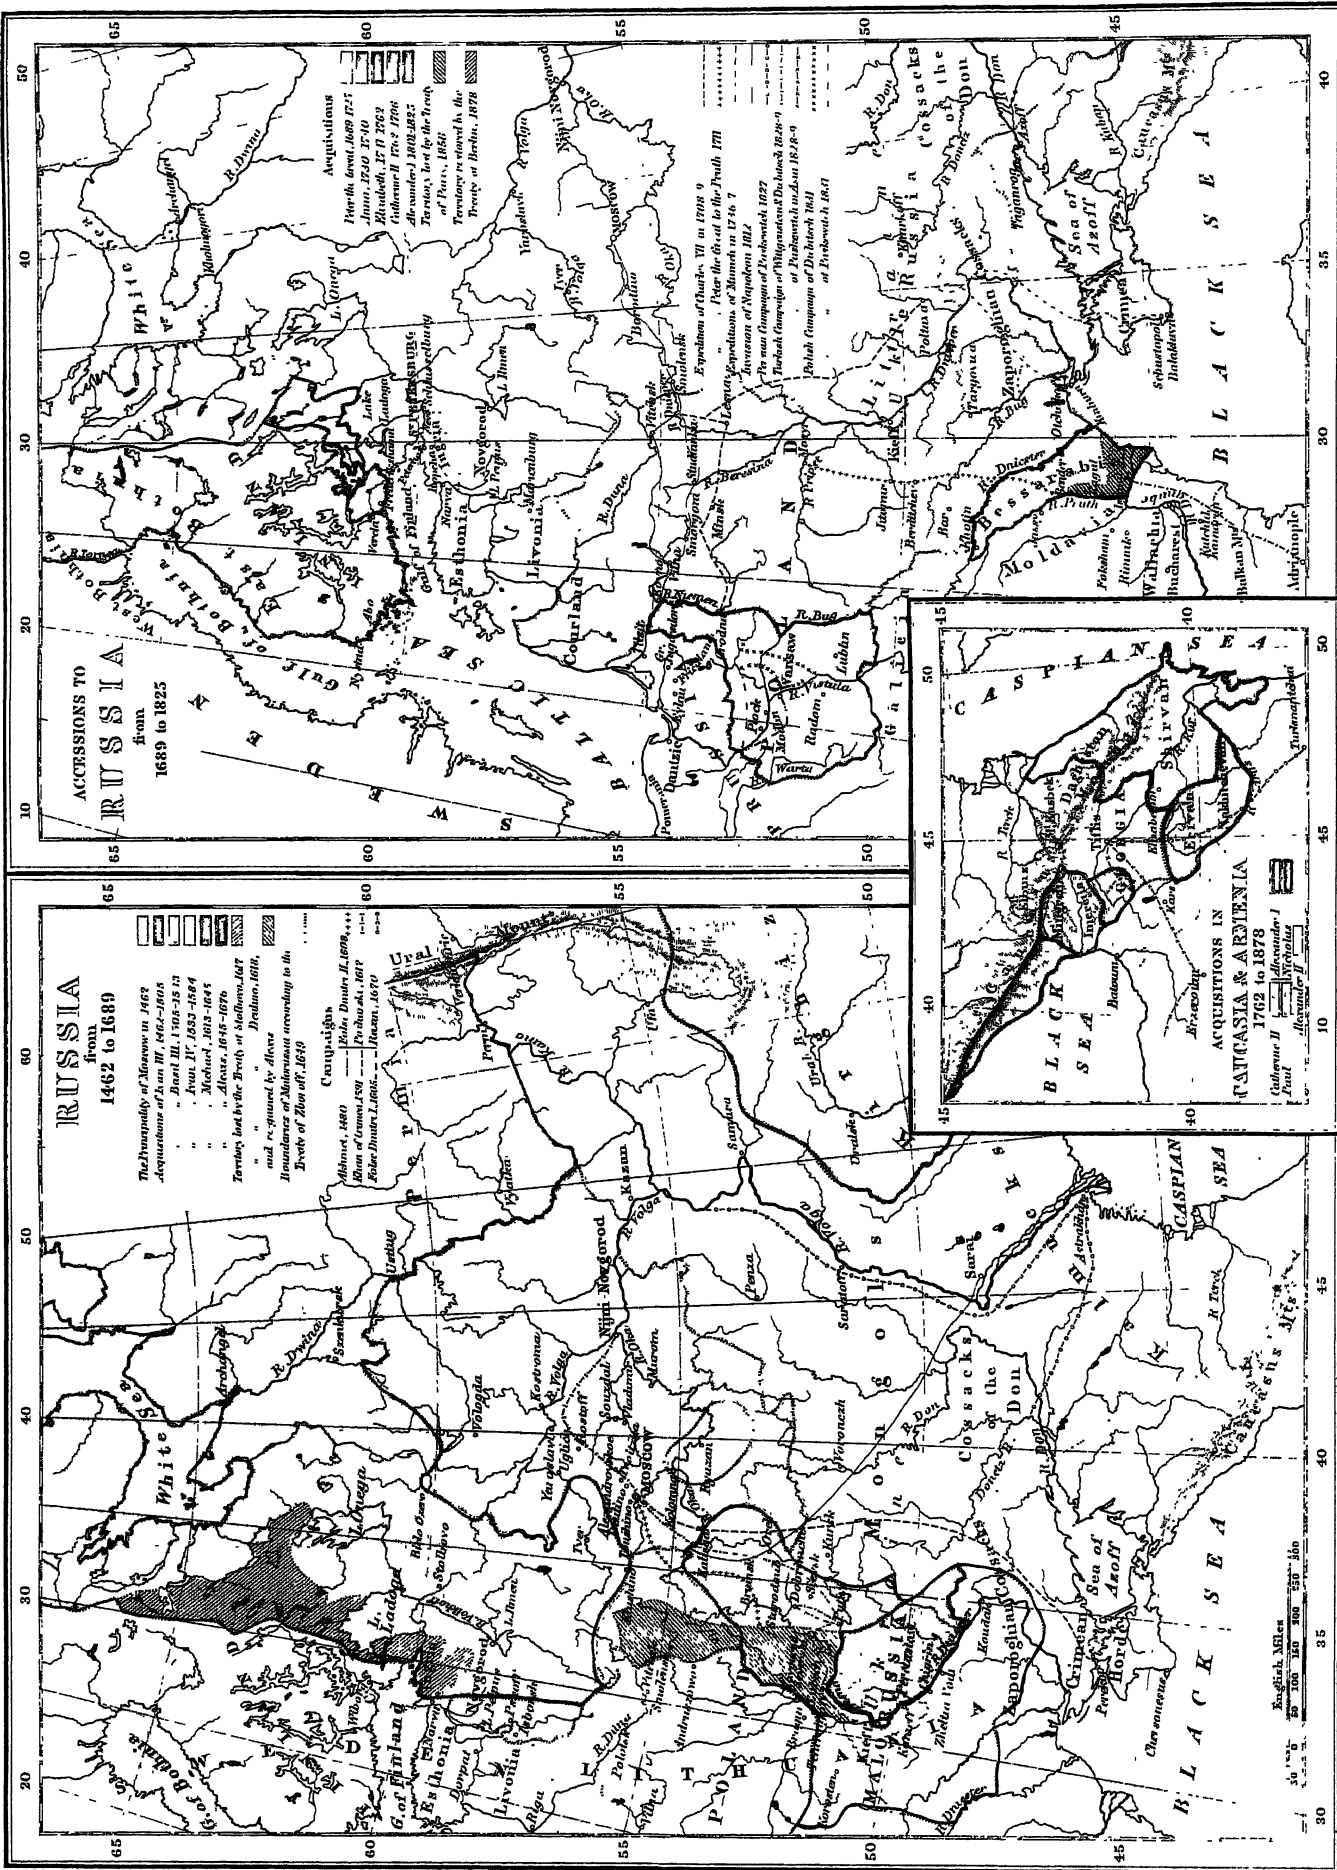

During 1882 the ports of the empire were visited by 13,638 foreign ships (5,337,000 tons), of which number 1436 were to Asiatic ports (391,200 tons). Of the above total only 2489 vessels (628,000 tons) were under the Russian flag (mostly Finnish), while the British alone showed a tonnage of 2,258,000 and the German 639,000. The coasting trade was represented by 35,083 vessels (6,040,000 tons) entering the ports, chiefly those of the Black Sea. The mercantile marine of Russia in 1882 numbered 6383 vessels (727,000 tons), including 604 steamers; of the total number 1593 (254,000 tons) were Finnish. The chief ports are St Petersburg, Odessa, Riga, Taganrog, Liban, and Reval. Baku has recently acquired some importance in consequence of the naphtha trade.³

The rivers of the empire, mostly connected by canals, play a very important part in the inland traffic. The aggregate length of navigable waters reaches 21,510 miles (453 miles of canals), and 12,600 miles more are available for floating rafts. In 1882 51,407 boats, with cargoes amounting to 153,250,000 cwts., valued at 186,480,000 roubles, left the ports on Russian rivers and canals.

II, 1883; *Annuaire of the Ministry of Finance: Russische Revue*, published monthly at St Petersburg by Roettger. On the petty trades, see *Memoirs of the Committee for Investigation of Petty Trades*, vols. I. to XII., 1879-84; and vol. VII. Isaeff's *Trades of Moscow*; several papers in reviews; and an appendix to the Russian translation of Reclus's *Géographie Universelle: Résumé de Matériaux on Russian Petty Trades*, 1874 (all Russian); also Thun, *Russlands Gewerbe*. For the position of workmen in manufactures see the extensive inquiries of the Moscow Zemstvo in its *Recueil*, and the reports of the recently nominated inspectors of manufactures, especially Yanjul, *Sketches and Researches*, 2 vols., 1884.

Corn, firewood, and timber constitute two-thirds of the whole cargoes carried. Within Russia proper, from 5740 to 7400 boats, larger and smaller, worth from four to seven millions of roubles, have been built annually during the last five years (7415 boats, valued at 6,758,000 roubles, in 1882,—18 of them being steamers); most of them are light flat-bottomed structures, which are broken up as soon as they have reached their destination. The number of steamers plying on inland waters, chiefly on the Volga, was estimated in 1879 at 1056 (80,890 horse-power).

Twenty-five years ago Russia had only 993 miles of railways; on January 1, 1883, the totals were 13,428 miles for Russia and Caucasia, 888 for Poland, 724 for Finland, and 141 for the Transcaspian region, and two years later they had reached an aggregate length of 16,155 miles. The railways chiefly connect the Baltic ports with the granaries of Russia in the south-east, and the western frontier with Moscow, whence six trunk lines radiate in all directions. Several military lines run along the western frontier, while two trunk lines, starting from St Petersburg, follow the two shores of the Gulf of Finland. Of the projected Siberian railway one main line (444 miles), connecting Perm and Berezni on the Kama with Ekaterinburg and the chief iron-works of the Urals, has been constructed. It has been extended east to Kamyshkoff, and is to be continued to Tiumen, 100 miles farther east, whence steamers ply to Tomsk.

Only 738 miles of the railways of Russia belong to the state, but most of them have been constructed under Government guarantees, involving payment of from 11 to 21 million roubles yearly. On the other hand the yearly increasing debt of the railways to the state amounted to 781,888,800 roubles in 1883. Of the aggregate value of the Russian railways, estimated at 2210 million roubles, no less than 1971 million roubles were held by Government in shares and bonds. The cost of construction has been altogether out of proportion to what it ought to be; for, whereas the average rate per verst (0.668 mile) in Finland was only 20,000 silver roubles, in Russia it reached 60,000, 75,000, 90,000, and even 100,000 roubles. In 1882 21,322 versts (14,136 miles) represented an expenditure of 2,210,047,632 roubles, and their net revenue was only 3.18 per cent. on the capital invested (4982 roubles per English mile in 1882). In 1884 34,674,853 passengers, 2,287,955 military, and 834,500,000 cwts. of merchandise were conveyed by 5808 locomotives and 120,940 carriages and waggons. Fully one-half of the merchandise carried consisted of corn (24 per cent.), coal (13 per cent.), firewood (12 per cent.), and timber (8 per cent.).¹

For the conveyance of correspondence and travellers along ordinary routes the state maintains an extensive organization of post-horses between all towns of the empire, that is, over an aggregate length of 110,170 miles. In 1882 4355 stations, with a staff of 15,560 men and 446,460 horses, were kept up for that purpose. In 1883 242,193,470 letters, newspapers (93,520,000), registered letters, and parcels were carried, of which 29,808,100 belonged to international correspondence. The telegraph system had in the same year an aggregate length of 65,394 miles, with 2,957 telegraph-offices, and 10,222,139 telegrams were transmitted.² (P. A. K.)

PART IV. RUSSIAN HISTORY.

Plate III. The Russians, properly so called, belong to the Slavonic race, itself a division of the great Aryan family. It cannot be denied that in the northern and eastern parts of Russia large Finnish elements have become mixed with the Slavs, and Mongolian in the south, but this is far from justifying the prejudiced attempts of Duchinski and others to challenge the right of the Russians to be called an Aryan people. The derivation of the words Russia, Russians (*Rous, Rossia, Rossiane*), has been much disputed. The old-fashioned view was to identify them with the *Rhoxolani*, who are now generally believed to have been a Medish tribe. The later and probably correct one is to derive the name from the Finnish Ruotsi applied to the Swedes, and considered by Professor Thomsen of Copenhagen to be itself a corruption of the Swedish word *rothsmenn*, rowers or seafarers. They are Scandinavian

vikings with whom we first become acquainted in northern Russia, and who in a way founded the empire, although from Arabian and Jewish writers we have dim records of a Slavonic race inhabiting the basin of the Dnieper about the close of the 9th century. In recent times Ilovaiki and Gedeonoff have again attacked the view of the Swedish origin of the invaders. They see in them only Slavs, but they are not considered to have shaken the theory which derives the name from Ruotsi. As the story goes, three brothers, Rurik, Sineus, and Truvor, were invited to Russia, from the north and settled at Novgorod in 862. Nestor calls them Varangians, a name in which most people are willing to see Norsemen. For a long time the Russians and Scandinavians are considered, as we shall find, to be separate races, but at length they are fused, as the Saxons and Normans in England under Henry I. Concerning the origin of the town of Novgorod, which bears a purely Slavonic name, nothing is known; it has been supposed that at first a Finnish settlement existed on its site. According to the legend the three brothers were invited over by a leading citizen named Gostomisl. There is, however, no mention of such a person in the *Chronicle* of Nestor. There is another story that Rurik was the son of the Swedish king, Ludbrat, a person met with in Scandinavian legend, and his queen Umila, the daughter of Gostomisl, and was born at Upsala in 830. Whatever the variants of the legend may be, we seem to learn one thing,—that a successful Scandinavian invasion occurred in the north of Russia. The three brothers finally settled in the country,—Rurik at Ladoga, where the river Volkhoff flows into the lake, Sineus at Bielo-ozero, and Truvor at Izborsk on Lake Peipus. On the death of his two brothers without heirs, we are told that Rurik annexed their dominions to his own, and took the title of *veliki kniaz*, or grand-prince. These three brothers are said to have brought two other adventurers with them, Askold and Dir, who, having had a quarrel with Rurik, set out with some companions to Constantinople to try their fortune. On their way they saw Kieff, situated on a rich and grassy plain, in the occupation of the Khazars. Of this city they made themselves masters, and permanently established themselves on the Dnieper. The origin of Kieff itself is involved in mystery. It is first mentioned about the 9th century. Constantine Porphyrogenitus speaks of τὸ κατὰ τὸ Κιοῦβα τὸ ἐπονομαζόμενον Σαυβάρας. This last word has given much labour to scholars; some are disposed to see in it the Norse *sandbakki*, the bank of sand. It is at Kieff that, according to the legend, St Andrew preached the gospel to the Russians. From this place Askold and Dir sallied forth two years afterwards, with an armament of two hundred vessels, sailed up the Bosphorus, and plundered the capital of the Byzantine empire. The Greek writers give 851 as the date of this enterprise, thus making it precede the arrival of Rurik by eleven years. The emperor at the time of their invasion was Michael III.

Having greatly extended his dominions by subduing the Igor and surrounding Slavonic tribes, Rurik died at an advanced age in 879, leaving the regency of the principality and the guardianship of his son Igor to the renowned Oleg.³ This chief subdued Smolensk, a city of the Krivitchi, in 882. Allured by its wealth and advantageous situation, Oleg now resolved to attempt Kieff, which was held by Askold and Dir. The story goes that he took young Igor with him, and disguised himself and his companions as Slavonic merchants. The unsuspecting Askold and Dir were invited to a conference and slain on the spot. Thus was Kieff added to the dominions of Igor, who was recognized as the

³ Both these names are Scandinavian, the original forms being Ingvar and Helgi.

lord of the town.¹ In 903 Oleg chose a wife for Igor, named Olga,² said to have been a native of Pskoff, the origin of which place, now mentioned for the first time, is unknown. We are told that it was a city of importance before the arrival of Rurik. The derivation of the name is disputed, some deriving it from a Finnish, others from a Slavonic root. Oleg next resolved to make an attack upon Byzantium, and his preparations were great both by sea and land. Leo the Philosopher, then emperor, was ill able to resist these barbarians. He attempted to block the passage of the Bosphorus, but Oleg dragged his ships across the land and arrived before the gates of Constantinople. The Greeks begged for peace and offered tribute. Oleg is said to have hung his shield in derision on the gates of the city. We may believe this without going so far as to give credence to Strykowski, the Polish writer, who says it was to be seen there in his time (16th century). The atrocities committed by Oleg and his followers are described by Karamzin, the Russian historian; they are just such as the other Norsemen of their race were committing at the same time in northern and western Europe. The Byzantines paid a large sum of money that their city might be exempted from injury, and soon after Oleg sent ambassadors³ to the emperor to arrange the terms. The treaty was ratified by oaths: the Byzantines swore by the Gospels, and the Russians by their gods Perun and Volos. In 911 Oleg made another treaty with the Byzantines, the terms of which, as of the preceding one, are preserved in Nestor. The authenticity of these two treaties has been called in question by some writers, but Miklosich truly observes that it would have been impossible at the time Nestor wrote to forge the Scandinavian names. Soon after this Oleg died; he had exercised supreme power till the time of his death to the exclusion of Igor, and seems to have been regarded by the people as a wizard. He is said to have been killed by the bite of a serpent, which had coiled itself in the skull of his horse, as he was gazing at the animal's unburied bones. The story is in reality a Scandinavian saga, as has been shown by Bielowski and Rafn. It is also found in other countries. In the reign of Igor the Petchenegs first make their appearance in Russian history. In 941 he undertook an expedition against Constantinople and entered the Bosphorus after devastating the provinces of Pontus, Paphlagonia, and Bithynia. Nestor has not concealed the atrocities committed by the Russians on this occasion; he tells us of the churches and monasteries which they burned, and of their cruelty to the captives. They were, however, attacked by the Byzantine fleet, and overpowered by the aid of Greek fire; many were drowned, and many of those who swam to land were slaughtered by the infuriated peasants; only one of their number escaped. Thirsting to avenge his loss, Igor fitted out another expedition in the spring of the following year. The Greeks were unwilling to run a risk again; they renewed the treaty which had been signed with Oleg, and were only too glad to purchase deliverance from their adversaries. The Russian at first demanded too much, but was finally persuaded by his more prudent attendants: "If Cæsar speaks thus," said they, "what more do we want than to have gold and silver and silks without fighting? Who knows which will survive, we or they? Who has ever been able to conclude a treaty with the sea? We do not go on the dry land, but on the waves of the sea; death is common to all."

¹ This story is considered by the historian Bestuzheff Riumin to be a mere legend invented to explain the connexion between Novgorod and Kieff.

² Here again we have a Norse name. Olga is equivalent to Helga, which in its older form is Holga.

³ It has been observed that the names of the ambassadors in this treaty are purely Scandinavian.

A treaty of peace was accordingly concluded, which is given at full length by Nestor; of the fifty names attached to it we find three were Slavonic and the rest Norse. The two races are beginning to be fused. From this expedition Igor returned triumphant. He was, however, unfortunate in a subsequent attack on the Drevlians, a Slavonic tribe whose territory is now partly occupied by the government of Tchernigoff. The Drevlians had long suffered from his exactions. They resolved to encounter him under the command of their prince Male; for they saw, as a chronicler says, that it was necessary to kill the wolf, or the whole flock would become his prey. They accordingly laid an ambuscade near their town Korosten, now called Iskorost, in the government of Volhynia, and slew him and all his company. According to Leo the Deacon, he was tied to two trees bent together, and when they were let go the unhappy chief was torn to pieces.

Igor was succeeded by his son Sviatoslaff, the first Russian prince with a Slavonic name. Olga, however, the spirited wife of Igor, was now regent, owing to her son's minority. Fearful was the punishment she inflicted upon the Drevlians for the death of her husband, and the story lacks no dramatic interest as it has been handed down by the old chronicler. Some of the Drevlians were buried alive in pits, which she had caused to be dug for the purpose previously; some were burned alive; and others murdered at a *trizna*, or funeral feast, which she had appointed to be held in her husband's honour. The town Iskorost was afterwards set on fire by tying lighted matches to the tails of sparrows and pigeons, and letting them fly on the roofs of the houses. Here we certainly have a piece of a *bilina*, as the old Russian legendary poems are called. Geoffrey of Monmouth and Layamon give the same account of the capture of the city of Cirencester by Gurmund at the head of the Saxons, and something similar is also told about Harold Hardrada in Sicily. Finally, at the close of her life, Olga became a Christian. She herself visited the capital of the Greek empire, and was instructed in the mysteries of her new faith by the patriarch. There she was baptized by him in 955, and the emperor Constantine Porphyrogenitus became her godfather. She did not, however, succeed in persuading her son Sviatoslaff to embrace the same faith, although he took no measures to impede its progress among his subjects. This son was as celebrated a warrior as Oleg; his victories were chiefly over the Petchenegs previously mentioned, a people of Mongol origin inhabiting the basin of the Don. He began, however, the fatal custom of breaking up Russia into apanages, which he distributed among his sons. The effects of this injudicious policy, subsequently pursued by other grand princes, were soon felt. Thus was paved the way for the invasion of Russia by the Mongols, who held it for two hundred years, and communicated that semi-Asiatic character to the dress and customs of the country which the *ukazes* of Peter the Great could hardly eradicate, and which perhaps have not entirely disappeared even in our own times. In his division of the country, Sviatoslaff gave Kieff to his son Yaropolk; to another son, Oleg, the conquered land of the Drevlians; to another, Vladimir, he assigned Novgorod. It would be impossible to interest the reader in the petty wars of these princes. After having gained several victories over the Petchenegs, Sviatoslaff set out on an expedition against the Bulgarians, a Ugro-Finnish tribe, dwelling on the banks of the Volga, the remains of whose ancient capital can still be seen. He made himself master of their country, but his victorious career was cut short at the cataracts of the Dnieper, where he and his soldiers were slain by the Petchenegs. According to the barbarous custom of the times, their prince Kurya made his skull

Vladimir. into a drinking-cup. Vladimir, the son of Sviatoslaff, was for some time a monster of cruelty and debauchery. He killed his brother Yaropolk, and seized his dominions; and, Yaropolk having some time before murdered his brother Oleg, Vladimir now became sole ruler. To his hereditary dominions he added Galicia or Red Russia, and subjugated some Lithuanian and Livonian tribes. Suddenly he seems to have been troubled with religious difficulties. According to the chronicler, he sent ambassadors to bring him reports of the different religions—Catholic, Jewish, Musulman, and Greek. The last of these beliefs seemed the most satisfactory. Vladimir marched south, took the city of Chersonesus in the Crimea, which at that time belonged to the Byzantine emperors, and then sent to demand the hand of the daughter of that potentate. After some deliberation his request was granted on condition that he was baptized. Accordingly he went to Constantinople in 988, and was admitted into the church, and at the same time received the hand of Anne, the Byzantine princess, although he seems to have already had a great number of wives. On his return to Kieff, he caused the image of Perun, the Slavonic god of thunder, which had been erected on an eminence, to be cast into the river, after having been belaboured by the cudgels of his soldiers. After this Vladimir issued a proclamation ordering all the inhabitants to proceed on the following day to the banks of the river to receive baptism. This extraordinary command met with universal obedience, and Russia was Christianized. As Vladimir introduced Christianity into

Yaroslaff. Russia, so Yaroslaff his son was the first legislator. He was prince of Novgorod, and died in 1054. Vladimir on his death divided his dominions among his sons:—to Yaroslaff, Novgorod; to Iziaslaff, Polotsk; to Boris, Rostoff; to Gleb, Murom; to Sviatoslaff, the Drevlians; and a few other provinces to others of his sons. Kieff, his capital, was seized by his nephew Sviatopolk, who murdered Boris and Gleb, now canonized among the martyrs of the Russian Church. Yaroslaff at length drove Sviatopolk from Kieff, and was temporarily restored by the Poles, but only to be driven out again, and he ended his life as an exile. Yaroslaff was successful against the Petchenegs, but failed in an attack on Constantinople. His great claim to be remembered lies in his publishing the first recension of the *Russkaya Pravda*, the earliest Russian code, which was handed down in the chronicles of Novgorod.

Period
of the
apanages.

We now leave the earliest period of Russian history, with its romantic stories and embedded sagas, telling us of heroic men, for the second division of our subject. The death of Yaroslaff was followed by the dreariest portion of the Russian annals—the period of the apanages (*udiel*), lasting from 1054 to 1238. The country was now broken up into petty principalities, and we shall understand its condition more clearly if we remember that the chief divisions of Russia from the 11th century to the 13th were as follows¹:—

(1) The principality of Smolensk, formerly of great importance, as including in its territories the sources of three of the great Russian rivers—the Volga, the Dnieper, and the Dina.

(2) The principality of Russia, in the early and restricted sense, the original element of the country. The first form of the name is Rous. The word appears to have been a collective appellation of the people; it was under the influence of the Byzantine writers that in the 17th century the form *Rossia* sprang up, which in time spread over the whole land. We must not forget, however, that to the majority of Englishmen, till the beginning of the 18th century, its name was Muscovy. Its situation on the Dnieper was very advantageous; and the soil was fertile, the black-earth region being at the present time the great wheat-growing district of Russia. Besides, the Byzantine territory was not far off. On the principality of Kieff depended that of Pereiaslavl; and Vishgorod, Bielgorod, and Tortchesk were made apanages for princes of the same dynasty.

(3) On the affluents of the right bank of the Dnieper, especially the Sozha, the Desna, and the Seim, stretched the principalities of Tchernigoff with Starodub and Lubech, and Novgorod Severski with Putivl, Kursk, and Briansk.

(4) The double principality of Ryazan and Murom.

(5) The principality of Suzdal.

(6) The republics of Novgorod and Pskoff, and the daughter-city of the latter, Vyatka.

Iziaslaff, the son of Yaroslaff, seems to have had a troubled reign of twenty-four years, constantly disturbed by civil wars. On his death in 1078, although he had two sons, he left the principality of Kieff to his brother Vsevolod, apparently on a principle common among the Slavs to bequeath the crown to the oldest male of the family; but, on the death of Vsevolod, Sviatopolk, the son of Iziaslaff, succeeded in 1093. At his death Vladimir Monomakh came to the throne, and ruled from 1113 to 1125. He was the son of Vsevolod, and was called after his maternal grandfather, the Byzantine emperor Constantine Monomachus. The reign of this prince was a very prosperous one. He left a curious treatise called "Instruction" (*Pouchenie*), addressed to his sons, in which we get a picture of the simple life in Russia at that period (see below, p. 103). He also founded on the river Kliazma a town which bears his name. There were continual quarrels among his descendants, but it is impossible to go into these minutely here. George Dolgoruki, one of the sons of Vladimir Monomakh, gained possession of Kieff in 1157, but the city soon began to pale before the growing power of Suzdal, and ceased to be the capital. He died the same year, just while a league was being formed to drive him out of it. The confederates entered the city, and their chief made himself prince. In 1169 Andrew Bogolioubski, son of George Dolgoruki, formed a coalition against Mstislaff, who was reigning in Kieff, and a large army was sent against the city. It was taken and pillaged; and the sacred pictures, sacerdotal ornaments, and even bells were carried off. It is on this occasion that the head of St Clement, the Slavonic apostle, which is known to have been preserved at Kieff, was lost.

After the fall of this city Russia ceased for some time to have any political centre. During the fifty-four years previous to the arrival of the Mongols, our chief interest is drawn to Suzdal and Galicia, and the republics of Novgorod and Pskoff. George Dolgoruki had founded the principality of Suzdal; his great anxiety, however, was to make himself master of Kieff. The chief aim of his son Andrew Bogoliubski was to extend his authority in another direction, and to cause it to be recognized at Novgorod the Great, where he had established his nephew as a kind of lieutenant. He attacked the city in 1170, but was completely repulsed from its walls, a panic having seized his army. The Novgorodians put to death many of their prisoners, and sold others as slaves, so that, to quote the words of their chronicler, "six Suzdalians could be bought for a grivna," an old piece of money. In 1173 Andrew was also defeated by Mstislaff the Brave at Smolensk, and in 1174 he was assassinated by his own nobles. The reign of Andrew was in all respects an important one. From his refusing to divide his dominions among his brothers and nephews, it is plain that he saw the evil effect of the system of apanages and could conceive the idea of a united state. He was a man of iron will, and an astute diplomatist rather than a great soldier. He thus had something of the spirit of the Ivans, and anticipated their policy. He may be said with truth to have been the last of the conspicuous rulers of Russia before the Mongol invasions. As yet we have had but few worthy of the attention of the historian. They are Rurik, the founder of the empire, Oleg the warrior, and Olga the first Christian sovereign. To these succeed the warlike

¹ See Rambaud, *Histoire de la Russie*, p. 76.

Sviatoslaff, slain by the Petchenegs; Vladimir, who caused the country to be Christianized; and Yaroslaff his son, the legislator. During the second period, in which we find Russia weakened and divided into apanages, we have only two noteworthy princes among a score of unimportant persons,—Vladimir Monomakh and Andrew.

The death of Andrew, whose murderers were not brought to justice, was followed by many petty wars. The only event, however, of any importance for a considerable time is the battle of Lipetsk (near Pereiaslavl Zaliesski) in 1215, in which George, son of Vsevolod, brother of Andrew, was defeated by the combined troops of Novgorod, Pskoff, and Smolensk. In 1220 we hear of Nijni-Novgorod being founded. A prince of considerable importance was Roman of Volhynia, to whom the inhabitants of Galicia offered the government of their principality, but he was superseded by another Vladimir, and did not get the crown till after a great deal of hard fighting. He is said by Kadlubek, the Polish historian, to have acted with ferocious cruelty. In 1205 he was killed in a battle with the Poles. In 1224 we have the first invasion of Russia by the Mongols. Daniel of Galicia was one of the last of the Russian princes to make his submission to Batu (1238). He died in 1264. In the 14th century the principality of Galicia was lost in the Polish republic, having been annexed to Lithuania. It joined the fortunes of that state in its union with Poland at the time of the marriage of Jagieffo with Jadwiga.

The
Mongol
supre-
macy.

We now come to the third division of our subject—Russia under the yoke of the Mongols, viz., from 1238 to 1462. This is indeed a dreary period, in which the political and material development of the country was delayed by its complete enslavement. The first occasion on which the Russians came into contact with their Mongolian invaders was in 1224, when, in company with their allies, the Polovtzes, they suffered a complete defeat on the banks of the Kalka, near where it flows into the sea of Azoff, and adjoining the site of the present town of Mariupol. On this occasion, however, the Mongols only marched a little way up the river Dnieper, and retired after devastating the country. In 1238 they reappeared, and after destroying Bolgar, the capital of the Finnish Bulgarians on the Volga, advanced against Ryazan, which was plundered and burned, with adjoining cities. They then defeated the army of Suzdal, at Kolomna, on the Oka; after which they burned Moscow, Suzdal, Yaroslavl, and other important towns. The grand-duke Yuri of Suzdal had encamped on the river Sit, almost on the frontiers of the territory of Novgorod. He was there defeated and was decapitated on the field of battle, while his nephew Vasilko had his throat cut for refusing to serve Batu. After taking Tver and advancing within fifty leagues of Novgorod, the Mongols turned south and occupied the two following years (1239–1240) in ravaging southern Russia. They then burned Pereiaslavl and Tchernigoff, and Mangu, the grandson of Jenghiz Khan, directed his march against Kieff. The noise of the great host proceeding to the capture of the fated city is graphically described by the chronicler. The city was taken and given up to pillage, not even the graves being respected. Volhynia and Galicia followed the fate of the other principalities, and all Russia was now under the yoke of the Mongols, except the territory of Novgorod.

The subsequent movements of these barbarians in Hungary and Moravia cannot be described here. It will suffice to say that soon afterwards Batu turned eastwards. He next founded on the Volga the city of Sarai (the Palace), which became the capital of the powerful Mongolian empire, the Golden Horde. Here also congregated the remains of the Petchenegs, the Polovtzes, and other

tribes, and to these barbarians Russia was for a long time tributary. In 1272 the Mongolian hordes embraced Islam. Yaroslaff, who entered into his territory of Suzdal after the death of his brother Yuri, found his hereditary domains completely devastated. He had commenced rebuilding the ruined town, when he was summoned by Batu to do him homage in his new capital of Sarai. This, however, was not considered sufficient, and the poor prince was obliged to betake himself to the court of the great khan, which was at the further end of Asia, on the banks of the river Amur. His title was confirmed, but on his return he died of the fatigues of the journey. He was succeeded in Suzdal by his son Andrew (1246–1252). His other son Alexander reigned at Novgorod the Great, and gained the surname of Nevski from his celebrated victory over the Swedes in 1240. He and Dmitri Donskoi are the only great figures of this period of national abasement. Alexander Nevski has become consecrated in the memories of the people, and is now one of the leading Russian saints. In spite, however, of his services to the people of Novgorod, he afterwards quarrelled with them and retired to Pereiaslavl Zaliesski. But the citizens were soon glad to betake themselves to his help. On being invaded by the German Sword-bearing Knights, who had established themselves in Livonia in the year 1201, and an army of Finns, Alexander was summoned, like another Camillus, and defeated the enemy on Lake Peipus in what was called the “Battle of the Ice” in 1242. He entered Novgorod in triumph with his prisoners. In spite of all this brilliant success, Alexander was unable to resist the power of the Golden Horde, and was obliged to go to Sarai to do homage to the khan. He was accompanied by his brother Andrew. The ceremony was always attended by many degrading acts of submission on the part of the tributary prince. In 1260 the Novgorodians, who had so long preserved the liberty of their republic uninjured, consented to submit to the khan and pay tribute; Alexander died before reaching Vladimir on his return from one of these humiliating journeys. A great part of western Russia was now consolidated by the Lithuanian princes into a state, the capital of which was Vilna and the language White Russian. To this many of the western provinces of Russia gravitated, and by the marriage of the Polish heiress Jadwiga with Jagieffo of Lithuania these provinces went to Poland and were not reannexed to Russia till a much later period. The eastern portion of Russia grouped itself round Moscow, which is first heard of in the chronicles in 1147. We find four considerable eastern states—Ryazan, Suzdal, Tver, and Moscow. For a century after its foundation we hear nothing of this city, the name of which is certainly Finnish. We are told that it was burned by the Mongols in 1237, and that a brother of Alexander Nevski was killed there in 1248, in a battle against the Lithuanians. We have seen that the political centre of the country has constantly changed. From Novgorod it went to Kieff, from Kieff to Vladimir, the capital of Suzdal, and from Vladimir to Moscow; we shall soon find that owing to the vigorous policy of its rulers this principality became the nucleus of the great Russian empire, and gathered round it the adjacent states. Its true founder was Daniel, a son of Alexander Nevski, who added to it the cities of Pereiaslavl Zaliesski and Kolomna. At his death in 1303 he was the first to be buried in the church of St Michael the Archangel, where all the Russian sovereigns were laid till the days of Peter the Great. Since that time, with the exception of Peter II., they have been interred in the church of the Petropavlovski fortress at St Petersburg. Daniel was followed on the throne by his sons Yuri and Ivan in succession. Yuri Danilovich (1303–1326) took possession of Mozhaisk. The

reign of Ivan Kalita, or the Purse (1328-1340), still further strengthened the new principality. Tver was added, and the pre-eminence of Moscow was assured by the metropolitan coming to reside there. After Kalita came in succession his two sons, Simeon the Proud (1340-1353) and Ivan II. (1353-1359). Simeon first took the title of grand-duke of all the Russias. He died of the Black Death, which was then devastating Europe. In spite of the efforts of these princes to maintain the supremacy of Moscow, on their death the hegemony of the Russian states went again for a time to Suzdal. It was Dmitri, surnamed Donskoi, the son of Ivan II., who won the battle of Kulikovo (lit. "the field of woodcocks") over Mamai, the Mongolian chief, in 1380. In spite of this, however, Toktamish their general invaded Russia, burned Moscow to the ground, and put to death a great number of the inhabitants. To Dmitri succeeded his son Vasilii or Basil (1389-1425), who was prince both of Moscow and Vladimir. He in turn was followed by Vasilii the Blind (1425-1462).

We begin to touch firmer ground when we approach the reign of Ivan III., the son of Vasilii, who may be considered the founder of the autocracy. We may take, therefore, as our fourth division the period from 1462 to 1613, which will include the consolidation of the empire under the vigorous rule of Ivan III., Basil V., and Ivan IV., the usurpation of Boris Godunoff, the reign of the false Demetrius, and the troubles following upon it till the accession of the house of Romanoff in the person of Michael in the year 1613. Ivan III. reigned forty-three years, and had as much influence in the consolidation of Russia as Louis XI. had in that of France. It was the great age when throughout Europe absolute monarchies were being created on the ruins of feudalism. On his accession Ivan found himself surrounded by powerful neighbours—to the east the great principality of Lithuania, to the south the Mongols; Ryazan and Tver had not been annexed to the territory of Muscovy; Novgorod and Pskoff were still republics. It was against Novgorod, a wealthy city and a member of the Hanseatic league, that his efforts were first directed. In consequence of its situation, and by its paying the tribute demanded, it had escaped from the ravages which other parts of Russia had undergone. Taking advantage of the factions which harassed this city, he succeeded in creating a party subservient to his own interests, and as early as 1470 had got the control of the government of the city, which a rival faction was anxious to transfer to the Poles. In 1478 the republic of Novgorod ceased to exist; the chief opponents of Ivan were transported to Moscow, and their goods confiscated. The *veche*, as the public assembly was called, was terminated for ever, and the bell which had summoned the mutinous citizens carried off triumphantly to Moscow. In 1495 the tyrant was so foolish as to confiscate the goods of many of the German merchants who traded at Novgorod. In consequence of this nearly all the foreigners left the city, and its prosperity rapidly declined. It is now a decayed provincial town, interesting only to the antiquary. In 1489 Vyatka, a daughter city of Pskoff, was annexed and lost thereby its republican constitution. In 1464 by giving the hand of his sister to the prince of Ryazan Ivan made sure of the proximate annexation of that apanage. He seized Tver and joined it to his dominions, when the grand-prince Michael had allied himself with Lithuania. The system of apanages in Russia had now to come to an end. But Ivan, who had married the niece of the Byzantine emperor, and assumed as his cognizance the two-headed eagle, was also to come into collision with the hereditary enemies of Russia, the Mongols. The great power of the Golden Horde had been broken up;

on its ruins had arisen the empires of Kazan and of Sarai or Astrakhan, the horde of the Nogais, and the khanate of the Crimea. In 1478, when Ahmed, the khan of the Great Horde, whose capital was Sarai, sent his ambassadors with his portrait, to which the Russian was to do homage, Ivan trampled it under foot, and put to death all the envoys, except one, who was deputed to take back the news to the khan. The reply of Ahmed to this outrage was a declaration of war; and the two armies met on the banks of the Oka. Ivan, who, like Louis XI., was much more of a diplomatist than a soldier, according to the accounts of the chroniclers, was in great terror, and could not be induced to fight by the persuasions of his soldiers or the benedictions of his ecclesiastics. He had already, after the armies had been for some time encamped opposite to each other, given the signal of retreat, when, in consequence of a sudden panic the Mongols also retreated, and the armies fled from each other in mutual fear. This invasion, which occurred in the year 1480, was the last great inroad of the Asiatic enemies of Russia, but we shall find some even later than the days of Ivan the Terrible, in whose time Moscow was burned by these barbarians. Meanwhile Ivan went on in his career of annexation. In 1472 he conquered Permian, in 1489 Vyatka. Ten years afterwards he had extended his authority as far north as the Petchora. His good fortune seemed ever on the increase; by a war with Alexander, king of Poland, he gained an accession of territory to the west as far as the river Desna. Upon peace being concluded, Alexander married Helen, the daughter of Ivan, but that monarch, on pretence that no regard had been paid to his daughter's religious scruples, declared war against his new son-in-law. The Polish monarch could not rely upon the fidelity of many of his vassals, as we find so often the case in Polish history, and suffered a complete defeat at the battle of the Vedrosha. On the other hand, in 1501 the Russians were routed at the battle of the Sirtza, near Isborsk, by the grand-master of the Teutonic order, Hermann von Plettenberg. The order had been established in Lithuania as early as 1225; the sword-bearers amalgamated with them in 1237.

In 1472 Ivan had married a Byzantine princess, Sophia, daughter of Thomas, brother of the emperor Constantine Palæologus. This Thomas had fled to Rome after the fall of Constantinople in 1453. In consequence of this marriage, a great many Greeks came to Moscow, bringing Byzantine culture, such as it was, to Russia, and among other things a quantity of valuable manuscripts, which formed the nucleus of the synodal library. Italians also made their appearance in Russia, among others the celebrated Aristotle Fioraventi of Bologna, the architect of so many buildings at Moscow. Ivan not only welcomed foreigners in his dominions, but entered into relations with many European powers, among others the Germans, the Venetians, and the Pope. His reign is remarkable, not only for the consolidation of the Russian autocracy, but also for legislation. In 1497 he issued his *Sudebnik*, or Book of Laws, the second Russian code after the *Russkaya Pravda* of Yaroslaff. Comparison of the two codes will show how much had been done by the Mongols to lower the Russian character. It is in the reign of Ivan that we first hear of the use of the knout: an archimandrite and some noblemen were publicly knouted for being concerned in forging a will. At his death Ivan bequeathed his throne to his second son Vasilii or Basil, passing over his grandson, the child of his eldest son Ivan, who had predeceased him; he was evidently unwilling to commit his growing empire to the perils of a minority. Vasilii Ivanovich (1505-1533) fully carried out the programme of his father. He destroyed the independence of Pskoff in 1510, put an end to the *veche* or popular assembly, and carried

off the bell which summoned the citizens. Thus fell the last of the Slavonic republics. Ryazan was next added to the Muscovite territory. The prince, being accused of having contracted an alliance with the khan of the Crimea, fled to Lithuania, where he died in obscurity. Novgorod Severski was annexed soon after, and by a war with Sigismund I. Basil got back Smolensk. He was doomed, however, to suffer from an invasion of the Mongols of the Crimea, and is said to have signed a humiliating treaty to save his capital, whereby he acknowledged himself the tributary of the khan.

Ivan IV.
(the
Terrible).

Meanwhile at home Basil exercised absolute authority; Russia now exhibited the spectacle of an Asiatic despotism. He entered into negotiations with many foreign princes. Herberstein, the German ambassador, who has left us such an interesting account of the Russia of this time, has told us of the great splendour of his court. We now come to the reign of the terrible Ivan, who has left his name written in blood upon the annals of Russia, and ruled for the long period of fifty-one years (1533-1584). It was a fortunate thing for the aggrandizement of the empire that, instead of having a succession of weak sovereigns, who only ruled a short time, it had three such vigorous potentates as Ivan III., Basil, and Ivan IV., whose united reigns extended over a hundred and twenty-two years. The grand-duke Basil at his death left two sons, Ivan and Yuri, under the guardianship of his second wife Helen Glinska. She had come into Russia from Lithuania, her family having been proscribed by the Polish king Alexander on the accusation of having plotted against his life. The grand-duchess ruled with great ability, but died in 1538, having been, as is supposed, poisoned. The two young princes then became the victims of the intrigues of the chief families, especially those of Shuiski and Belski. Ivan early gave proof of a vigorous understanding, whereas his younger brother Yuri appears to have been half-witted. In 1543, when only in his thirteenth year, Ivan determined to emancipate himself from the galling yoke of the boiars, and by a kind of *coup d'état* threw off their tutelage, and caused Shuiski to be torn to pieces by dogs. After this, for some time, he was under the influence of his maternal relations. In January 1547 Ivan was crowned by the metropolitan Macarius, and took the title of czar, or tsar, a Slavonic form of the Latin Cæsar. He soon afterwards celebrated his marriage with Anastasia Romanova. The same year a great conflagration took place at Moscow. The mob affected to believe that this had been caused by the Glinskis, who were very unpopular, and massacred a member of that family.

After this time Ivan seems to have committed himself very much to the guidance of the priest Silvester and Alexis Adasheff. This was the happiest portion of his reign, for he was also greatly under the influence of his amiable wife. To this period also belongs a recension of the *Sudebnik* of his grandfather Ivan III. (1550), and the *Stoglaŭf*, or Book of the Hundred Chapters, by which the affairs of the church were regulated (1551). In the following year Ivan became master of Kazan, and two years later of Astrakhan. The power of the Mongols was now almost broken. Triumphant in the south and the east, he then turned his attention to the north, being anxious to open up a means of communication with the west. He anticipated the plans which Peter the Great was destined to carry out long afterwards. He was thus brought into collision with the Swedes and the Teutonic Knights. When Ivan sent a German named Schlitt to procure the assistance of some foreign artisans, they were stopped by the Germans and prevented from entering Russian territory. In consequence of this, war afterwards broke out between Ivan and the Order. In 1558 the

Russian army invaded Livonia, and took several towns, whereupon the Order made an alliance with Sigismund Augustus of Poland. But, while Russia was busy with this war, a great change was taking place in the home policy of Ivan. He threw off the influence of Silvester and Adasheff, who were both banished. From this time may be said to date the commencement of the atrocities of this czar which have earned him the epithet constantly added to his name. He was especially moved by the treason of Prince Andrew Kurbski, who, having lost a battle with the Poles, was too much afraid of the wrath of his imperial master to venture again into his clutches. He accordingly fled to the king of Poland, by whom he was well received, and from his safe retreat he commenced an angry correspondence with the czar, reproaching him with his cruelties (see below, p. 104). The answer of Ivan has been preserved. In it he dwells upon the degrading subjection in which he had been kept by his early advisers, and attempts to justify his cruelties by saying that they were only his slaves whom he had killed, over whom God had given him power of life and death.

In December 1564 Ivan retired with a few personal friends to his retreat at Alexandrovskoe, near Moscow, where he passed his time pretty much as Louis XI. did at Plessy-les-Tours, for he resembled the French monarch both in his cruelty and his superstition. The boiars, afraid that the monarch was about to quit them for ever, went in crowds to Alexandrovskoe to supplicate him to return to Moscow. This he finally consented to do, and on his return established his bodyguard of *oprichniks*, who were the chief agents of his cruelty. In the year in which he retired to Alexandrovskoe we have the establishment of a printing-press at Moscow. Ivan now commenced a long series of cruelties. To this period belong the deposition and perhaps murder of Philip, the archbishop of Moscow; the execution of Alexandra, the widow of his brother Yuri; the atrocities committed at Novgorod, which seems to have fallen under the tyrant's vengeance for having meditated opening its gates to the king of Poland; and, lastly, the terrible butcheries on the Red Square (*Krasnaia Ploščad*).

It was in the reign of Ivan that the English first had dealings with Russia. In 1553, while Edward VI. was on the throne, three ships were sent out under Willoughby and Chancellor to look for a north-east passage to China and India. Willoughby and the crews of two of the ships were frozen to death, but Chancellor arrived safely in the White Sea, and thence proceeded to the court of Ivan, by whom he was favourably received. The English secured great trading privileges from Ivan, and established factories in the country. In one of his mad sallies, Ivan actually wrote to Queen Elizabeth (1570) asking for a safe retreat in her dominions if he should be driven out by his own subjects.

Ivan was continually waging war in the Baltic territory with the Teutonic Knights, in which, although on the whole unsuccessful, he committed great cruelties. But in 1571 he was obliged to suffer another invasion of the Mongols of the Crimea, who, to quote the quaint language of an English resident, burned "the Mosco every stick" (Hakluyt's *Voyages*, i. 402). On the death of Sigismund Augustus of Poland in 1572, when the crown of that country had become elective, the family of the Jagielllos being now extinct, Ivan declared himself one of the competitors. The successful candidate was the French prince Henry of Valois, but he soon fled from his new kingdom, and, on the throne again becoming vacant, the redoubtable Stephen Batory was chosen, who proved a formidable foe to the tyrant now growing old. In consequence of the successes of Stephen, Ivan was obliged to abandon all his

conquests in Livonia; and the attempt to open up a passage for Russia into the Baltic failed till carried out by the efforts of Peter the Great.

One of the chief events of this reign was the conquest of Siberia by a Cossack named Yermak, who had formerly been a robber, but was pardoned by the czar on laying his conquests at the imperial feet. Among many points in which Ivan resembled Henry VIII. was the number of his wives. On the death of the seventh, he was anxious to procure an eighth from the court of his friend Elizabeth of England, and the daughter of the Earl of Huntingdon was offered to the inspection of the Russian ambassador, Feodor Pisemski, at her own desire and the queen's. She was presented to him in the gardens of York House. The ambassador prostrated himself before her, and professed to be dazzled by her beauty. Before, however, the negotiations for the marriage were concluded, the young lady, of whom a very favourable account had been transmitted to the court of Moscow, became alarmed. Rumours had reached her about the former wives of the czar and his habits. She therefore declined the brilliant prospect of an alliance associated with so many dangers. Full details of the adventures of the Englishmen who resided at Ivan's court will be found in Hakluyt's *Voyages*. In 1567 Anthony Jenkinson was commissioned by the czar to convey a special message to Queen Elizabeth, "that the Queen's Majestie and he might be to all their enemyes joynd as one, and that England and Russland might be in all manners as one." In fact Ivan wanted the assistance of the English in his wars against the Swedes and the Poles; he could appreciate the superiority of their weapons and military tactics; but Elizabeth only cared to secure a monopoly of trade, which the English for a long time enjoyed, and, according to the historian Ustrialoff, the Russians were but little benefited by it.

The declining days of Ivan were embittered by the death of his eldest son, whom he had stricken in a fit of passion with his iron staff. When the paroxysm of his anger was over, his grief was boundless. Full of remorse and continually afraid of conspiracies which might be concocted by his subjects, and harassed by superstitious dread, in which he betook himself to the divination of witches,¹ he expired in the year 1584.

Feodor. Ivan was succeeded by his eldest surviving son Feodor (Theodore), at that time twenty-seven years of age. He was feeble both in mind and body, and very superstitious. Fletcher calls him "very simple, and almost a natural," and Solomon Henning, author of a *Chronicle of Livonia*, says that he was so weak-minded that he could find no greater amusement than tolling the church bells before service. In consequence, the chief power in the empire fell into the hands of Boris Godunoff,² the brother-in-law of Feodor, a man of boundless ambition and great capacity. His inordinate lust of rule he concealed under the guise of piety; his commanding presence extorted respect wherever he went. Between him and the throne were only the sickly Feodor and his brother Dmitri, still a child, who had been previously removed to the town of Uglich in the government of Yaroslavl. For a while Boris had nourished the idea of proclaiming Dmitri illegitimate, on the ground that he was the son of Ivan's seventh wife, a marriage forbidden by the canons of the church. Finally, as there seems every reason to believe, he caused the child to be assassinated at Uglich on the 15th of May 1591. The circumstances of the death of the young prince are involved in mystery; so much, however, is certain. Dmitri was playing in a court-yard; his gover-

ness Vasilissa Volokhova, his nurse, and a servant-maid were in attendance. Whether from accident or design they all for a time lost sight of him. According to their testimony while under examination, the young prince had a knife in his hand when last seen; he amused himself with sticking it into the ground and cutting pieces of wood. Suddenly the nurse, on looking round, saw him prostrate and covered with blood. He died almost immediately from a large wound in his throat. The account of how the news was brought to Moscow is described in a highly dramatic manner by Horsey.³ We have no direct evidence of the complicity of Godunoff in this murder; but there seems little doubt of it. A secret inquiry was conducted; the body, however, was not examined, and the commissioners reported that Dmitri had died of a wound accidentally inflicted by himself in a fit of epilepsy. On account of the riot which had taken place at Uglich, Boris proceeded to punish the town. More than two hundred of the inhabitants were put to death and many sent to Siberia. The church bell of Uglich was banished with them and placed in the capital of Siberia; it was not brought back till the earlier part of the present century. The remains of Dmitri, who was afterwards canonized, were deposited in the cathedral of St Michael, the burial-place of the czars. Soon afterwards a great fire broke out in Moscow, and Boris caused many streets to be rebuilt at his own expense, distributed aid, and exempted the sufferers from taxes; but still the people murmured secretly; they felt that the stain of blood was upon him, and ungratefully accused him of having caused the city to be set on fire. In the same year (1591) the khan of the Crimea made one of his periodical raids against Moscow. He set out from Perekop, and marched in a straight line, everywhere plundering and devastating. In these circumstances, Feodor displayed nothing but imbecility. He merely remarked that the saints who protected Russia would fight for her, and again betook himself to his favourite amusement of bell-ringing. Boris, however, showed vigour. In a few days he caused Moscow to be surrounded with palisades, redoubts, and artillery. The Mongols were repulsed with great slaughter; but, although Boris saved his country, he could not secure the goodwill of the people. Indeed, they accused him of having invited the Mongols that the general danger might make them forget the death of Dmitri. The czarina, Irene, wife of Feodor and sister of Boris, about this time gave birth to a female child, which lived but a few days, and Boris was of course accused of having poisoned it. In reality the princess suffered from continual ill-health, and on one occasion we find Elizabeth of England sending her a physician. Boris, however, still persevered in his energetic measures for strengthening the empire. Smolensk was fortified, Archangel built; and a strong cordon was drawn round the territories occupied by the Mongols. The Swedes were driven into Narva, and diplomatic relations were opened with the European powers.

About this time the imbecile Feodor died, and with him became extinct the dynasty of Scandinavian Rurik. This event occurred in 1598, and Boris was elected to Boris, succeed him. Godunoff, however, who felt sure of the crown, at first affected to be unwilling to receive it. He retired to a monastery and was followed by the people, supplicating him to be their emperor. He kept Russia in this state of suspense for six weeks, and then relented. As soon as he ascended the throne, the traces of his vigorous hand could be found everywhere. One of his first plans was the abridgment of the power of the nobility, which had been begun by Ivan III. and continued by Ivan IV. By this a benefit was conferred upon Russia; but Boris also served his own ambition. He was particularly severe to

¹ Horsey's *Diary*, edited for the Hakluyt Society, 1856, p. 199.

² He was of Mongol descent,—his ancestor being a certain Murza Tchét.

³ *Diary*, ed. Bond, p. 254.

all members of the Romanoff family, because they were allied to the house of Rurik, and troubled his dreams of sovereignty. The head of this house was compelled to become a monk; his son, however, was destined to ascend the throne. A famine broke out in 1601, which Boris was unsparing in his efforts to allay. In the midst of all this suffering a rumour spread that Dmitri, the youngest son of Ivan the Terrible, was not dead.

The "false" Dmitri. One day in the year 1603 Prince Adam Wisniowiecki, of Bragin in Lithuania, happening to be very angry with a servant, struck him and used an insulting epithet. The young man, with tears in his eyes, said, "If you knew who I am, you would not treat me so nor call me by that name." "Who then are you, and whence do you come?" replied the astonished prince. "I am the prince Dmitri, son of Ivan Vasilievich." He then recounted a well-concocted tale of his miraculous escape from the assassin whom Boris had employed. This was his physician, who feigned compliance with the usurper's designs, but only to frustrate them. On the night appointed for the murder, the man, whose name was Simon, put the son of a serf into his young master's bed (who was accordingly killed), and immediately fled with Dmitri from Uglich. He was then committed to the care of a loyal gentleman, who thought it better for the sake of protection that he should enter a monastery. This gentleman and the physician were dead, but in confirmation of his story the false Dmitri exhibited a seal, bearing the arms and name of the prince, and a golden cross set with jewels which he said was the baptismal gift of his godfather, Prince Ivan Mstislavski. Wisniowiecki believed his tale. There were also other supposed signs.¹ The Polish nobles thronged around the young man, whose manners, as we read in the case of Perkin Warbeck, seemed to bear out his pretensions. Meanwhile Dmitri remained in Poland, enjoying all the lavish attentions of the Polish nobility. Boris was soon made acquainted with his appearance on the scene, and offered the brothers Wisniowiecki money and lands if they would surrender the impostor to him. Without, however, replying to these overtures, they removed him into the interior of Poland, and he was received with royal honours by George Mniszek, the palatine of Sandomir. Here he is said to have entered into a secret understanding with the Jesuits to bring over Russia to the Latin faith, on condition of being supported by the papal nuncio.² The pretender privately abjured the Greek faith, and signed a contract of marriage with Marina, the youngest daughter of Mniszek, by which he settled upon her the towns of Novgorod and Pskoff, and engaged to pay her father a million of florins as soon as he had ascended the throne. Afterwards he executed another treaty ceding Smolensk and the surrounding territory to Mniszek and

¹ The present writer doubts the genuineness of this claimant; many authors, however, some of them contemporaries, were convinced that he was the real son of Ivan, and among these the first place must be assigned to the French mercenary captain Margeret, whose intimate relations with the man point him out as a valuable authority. This clever adventurer had entered the Russian service in the time of Boris Godunoff, and was a witness of the whole struggle. At first he led the troops of the latter against Dmitri, but when the pretender had established his authority he accepted a post in his service. He has given us an interesting portrait of Dmitri, of whom he speaks very favourably, in his work on Russia published at Paris in 1669.

² According to some authors, the whole plot had been concocted by the Jesuits for this purpose. For the contrary view, however, see *Rome et Démétrius d'après des documents nouveaux avec pièces justificatives et facsimile*, by Père Pierling, S. J., Paris, 1878. Gerard Müller tells us that the pretender "conversed in Latin and Polish with fluency;" if this had been the case his knowledge of the former would be easily explained by his Jesuitical training. Margeret, however, denies it altogether. "Il est très certain qu'il ne parloit nullement Latin, j'en puis témoigner, moins le savoit-il lire et écrire" (p. 163).

the king of Poland. These proceedings were not likely to recommend him to his Russian subjects. For the present they were concealed, and Dmitri publicly professed the Greek ritual. Soon after this Sigismund of Poland saluted him as czar of Moscow, and assigned him a pension of 40,000 florins. All this time Boris affected to regard the pretender with contempt, and issued a manifesto setting forth that his real name was Grishka (or Gregory) Otrepieff, a renegade monk. Whether this individual was really the man who personated Dmitri, the son of Ivan, cannot be known for certain; but it seems very probable. Karamzin has adopted this view. Boris soon issued a proclamation against him, calling him an apostate monk, who wished to introduce the Latin heresy into Russia, and to build Romish churches in the Orthodox land. Dmitri entered that country on the 31st of October 1604, and marched on Moravsk in Tchernigoff. He met with uninterrupted success, large numbers joining his expedition, and the authorities of the chief towns on his route offering him bread and salt till he came to Novgorod Severski on the 23d of November. This well-fortified place was defended by Basmanoff, a veteran captain, with five hundred streltzi. On the arrival of the pretender he was summoned to capitulate, but, standing on the ramparts with a lighted match, he replied: "The grand-prince and czar is at Moscow; as for your Dmitri he is a robber, who shall be impaled, along with his accomplices." After three months the invaders abandoned the siege, but they had the good fortune soon afterwards to seize a large sum of money which Boris was sending to some of the towns. Shortly after this the important fortresses of Putivl, Sievsk, and Voronezh surrendered to Dmitri. Boris was too ill to go in person against the impostor; he, however, raised an army of fifty thousand men. A great battle took place near Novgorod, and the supporters of the czar would have suffered a most ignominious defeat had it not been for Basmanoff. This captain was recalled to Moscow and loaded with honours by Boris, who, from motives not very evident, unless he had begun to have suspicions of his fidelity, detained him in the city, and committed the care of the new army which he had formed to Shuiski, who was probably only half-hearted in his cause. A great battle took place on the 2d of January 1605, on the plain of Dobrinichi, not far from Orel; here Dmitri was defeated, chiefly through the bravery of the foreign legion. He would have been captured had it not been for the fidelity of his Cossack infantry—for at this time the Cossacks were subject to Poland—who were killed to a man, and probably not a fugitive would have reached Sievsk had not Shuiski acted with duplicity. Meanwhile, the pretender rode as fast as his horse would carry him to Putivl, a strong town on the frontier, from which he could easily beat a retreat into Poland. The followers of Boris remained at Dobrinichi, putting to death their prisoners. The conduct of Shuiski showed with what apathy he viewed the cause of his master; he soon drew off his troops into winter quarters, alleging that nothing more could be done that season, and also wasted time before Kromi, an insignificant place. Meanwhile Dmitri corrupted some of the chief generals of Boris. An attempt to poison him soon afterwards failed, and the pretender sent a message to Boris, recommending him to descend from the throne which he had usurped. But the days of the latter were numbered. On the 13th of April 1605 he presided as usual at the council-board, and received some distinguished foreigners. A grand banquet was given, but suddenly after dinner he was seized with illness; blood burst from his nose, ears, and mouth, and in the brief period before his death, according to the Russian custom, the dress of a monk was thrust upon him, and he was

consecrated under the name of *Bogolep* ("acceptable to God"). He expired in the fifty-third year of his age, after a reign of six years. Whether he committed suicide or was poisoned cannot now be ascertained; his death could hardly have been natural. Boris was a man of great energy of character, with views singularly in advance of his age. In some respects he anticipated the plans of Peter the Great; thus he caused several young Russians to be sent abroad to be educated, some of whom came to England. By a ukaze, however, binding the peasant to the soil, he began the system which reduced him by degrees to a condition of abject serfdom.

Feodor II.

Boris had left a sufficient number of partisans at Moscow to proclaim his son Feodor, a youth of sixteen, and all classes took the oath of allegiance to him. Shuiski and Mstislavski returned to Moscow to assist the young czar in the government. Basmanoff was sent to take the command of the army, but, probably feeling the cause of Feodor to be desperate, on the 7th of May he proclaimed Dmitri. He was now ordered to march on the capital. Feodor, however, and his adherents still held the Kremlin with a large garrison. Accordingly it was resolved to make an attempt on Krasnoe Selo, a large town near Moscow, where many wealthy merchants resided. This was easily taken, whereupon many of its citizens marched to Moscow, and convoking the people called upon them to acknowledge Dmitri as their sovereign. Feodor and his mother were murdered, and buried in a cemetery outside the city walls, whither also the remains of Boris were carried, for they were not allowed sepulture among the tombs of the czars. Petreius, the Swedish envoy, who has left us an interesting account of these times, tells us that the rumour was circulated that these unhappy people had poisoned themselves, but he himself saw their bodies, and the marks on their necks of the cords with which they had been strangled. According to some authorities, Xenia, the daughter of Boris, described as beautiful by the old Russian chronicler Kubasoff, was forced to retire into a convent, but Petreius declares that she was compelled to become the mistress of the conqueror. The usurper now hearing that every obstacle was removed, marched upon the capital, which he entered on June 20, 1605. We have not space to detail the splendours of his retinue, nor the ceremonies and feastings which attended his arrival. He acted at first with prudence and conciliation towards his new subjects, and even promised to pay the debts of his father Ivan. He received his mother with transports of joy; she professed to identify him, although she afterwards denied that he was her son. She was probably, however, glad enough to get out of the convent into which she had been thrust by Boris. But Dmitri soon gave offence on account of his neglect of Russian etiquette and superstitious observances. It was plain that he held the Greek Orthodox religion very cheap, and his subjects could see that he had a propensity for the Latin heresy. In the following year Marina Mniszek, his bride, made her appearance in Moscow, and the marriage took place on the 18th of May. It was followed by continued banquets. But a rebellion broke out on the 29th, at the head of which was Vasilii Shuiski, whom Dmitri had spared when about to be executed. The czar, hearing a noise in the night, and finding himself surrounded by enemies, opened a window 30 feet from the ground, leapt down, and broke his leg. He was soon afterwards found and killed. Basmanoff was slain while attempting to defend his master. The corpse of the impostor was afterwards burned. Marina was not killed, although there was a great massacre of the Poles in every quarter of Moscow; she and the ladies of her suite were kept as prisoners. Thus ended this remarkable

Dmitri acknowledged.

episode of Russian history. The whole period has been aptly termed by the national historians "the Period of Troubles" (*Smutnoye Vremya*).

The boiars, on being convoked after the murder Basil of Dmitri, elected Vasilii Ivanovich Shuiski for their sovereign, but he found himself in every way disadvantageously situated, without an army and without money. He was, moreover, troubled by an announcement which gained credence among the people that Dmitri was not really dead. To put an end to these rumours, Shuiski, entirely changing his policy, and contradicting his previous assertions, sent to Uglich for the body of the unfortunate prince, and caused him to be canonized. Two subsequent impostors, who gave themselves out to be Dmitri, were taken and executed. To complete the misfortunes of Russia, the country was invaded by the Poles in 1609, who laid siege to Smolensk. Shuiski suffered defeat at Klushino (a village situated to the west of Moscow), was taken prisoner, and was set free, to become a monk,—a favourite way of treating troublesome persons in Russia. He was afterwards delivered over to Sigismund, who kept him in prison during the rest of his life. The crown was finally offered to Ladislaus, the son of Sigismund, who in reality for two years was sovereign of Russia, and caused money to be coined in his name at Moscow. Everything seemed to portend the ruin of the country, when it was saved by the bravery of Minin, the butcher of Nijni-Novgorod, who roused the citizens to arms by his patriotic appeal, and was joined by Prince Pozharski. The latter took the command of the army; the administrative department was handed over to the former. The brave prince succeeded in driving the Poles from Russia. In 1612 the boiars resolved to elect a new czar, but they did not actually meet till 1613, and many debates ensued. The sufferings of the country had been great; a considerable part of the city of Moscow (with the exception of the Kremlin and the churches built of stone) was laid in ashes. The treasury was plundered, and its contents sent to Poland. Among other things Olearius, the traveller of the 17th century, quaintly adds, "the Russians lost the horn of a unicorn of great value, set with precious stones," which was also carried off to Poland; and he tells us that even up to his time the Muscovites bitterly regretted that they had been robbed of it. Princes Mstislavski and Pozharski refused the crown, and finally the name of Michael Romanoff, a youth of sixteen, was put forward as a candidate, chiefly on account of the virtues of his father Philarete. The Romanoffs were connected on the female side with the house of Rurik, Anastasia Romanova having been the first wife of Ivan the Terrible. Before being allowed to ascend the throne, the youthful sovereign, according to some authors, took a constitutional oath. The condition of the country all this time was most critical; large portions of its territory were in the hands of the Swedes and Poles, and the villages were plundered by wandering bands of Cossacks. Ladislaus the son of Sigismund had not yet renounced the title of czar; in 1617 he appeared with an invading army under the walls of Moscow, but was repulsed, and on December 1, 1618, consented to abandon his claims, and conclude an armistice for fourteen years. In 1617 a treaty had been made at Stolbovo, a town near Lake Ladoga, by which the Russians had been compelled to give up a large portion of their territory to the Swedes. Philarete, the father of Michael, who had been for some time imprisoned at Warsaw, was now allowed to return; he entered Moscow in 1619, and was elected patriarch, an office which had been vacant since the death of Hermogenes. Michael associated his father with himself in his power; all ukazes

Ladislaus.

Michael Romanoff.

were published in their joint names; the patriarch held a separate court, and always sat at the right hand of the sovereign. The patriarchate was suppressed in 1721 by Peter the Great, who had formed the idea of making himself head of the church from what he saw in England and other Protestant countries. The reign of Michael was not very eventful; he employed it wisely in ameliorating the condition of the country, which had recently suffered so much, and in improving the condition of his army. Foreigners began to visit the country in great numbers, and Russia was gradually opening itself to Western civilization. Gustavus Adolphus of Sweden induced the czar to sign a treaty offensive and defensive, and a Swedish ambassador appeared at the Russian court. The sufferings which had been inflicted upon them by the Poles made the Russians eager to join an alliance which was directed against the Roman Catholic religion. In 1629 a French ambassador appeared at Moscow. Dutch and German artisans were taken into the Russian service to assist in the iron-foundries, with special view to the manufacture of cannon. The country swarmed with English merchants who had obtained valuable privileges. Scottish adventurers were to be met with in the Russian army in great numbers. We find them as early as the reign of Ivan the Terrible, to judge from Horsey's *Diary*. The false Demetrius, like Louis XI., had a Scottish guard. In Russian documents we find the names of Carmichaels, Hamiltons (frequently in the corrupted Russified form of Khomutoff), Bruces, Gordons, and Dalziels. From Scottish settlers in Russia sprang the celebrated poet Lermontoff, the first two syllables of whose name fully show his Caledonian origin.

Alexis.

The following are the leading events of the reign of Alexis, who succeeded to the throne on the death of his father Michael in 1645. (1) First comes his codification of the Russian laws (called *Ulozhenie*), which was based on the preceding codes of Ivans III. and IV. By the order of the czar, a commission of ecclesiastical and lay members was appointed to examine the existing laws, and make any necessary additions, or to adapt to present needs any which had become obsolete. The work was chiefly carried on by Princes Odoievski and Volkonski, with the assistance of two secretaries. They were engaged over it two months and a half, and the original code is still preserved in the Oruzhennaia Palata at Moscow. Ustrialoff boasts that, by recognizing the equality of all men in the eyes of the law, it anticipated a principle which was not generally acknowledged in western Europe till the 18th century. This doctrine, however, may be considered as only a natural consequence of autocracy. We are told that Alexis allowed access to all petitioners, and at his favourite village of Kolomenskoe, opposite his bed-room window, was placed a tin box; as soon as the czar rose and appeared at the window the suppliants came forward with their complaints, and, making an obeisance, placed them in the box, which was afterwards taken to him. (2) The second great event of his reign was the incorporation of the Ukraine and country of the Cossacks with Russia. For a description of the causes of this war, see POLAND. (3) By the treaty of Andruszowo the Russians gained Smolensk, Tchernigoff, and finally Kieff, the Dnieper being the new boundary, and thus the towns which had been taken by the Lithuanians and annexed to Poland by the treaty of Lublin (1569) became Russian again. The only other events of the reign of Alexis of any importance are the great riot at Moscow, on account of the depreciation of the coinage in 1648, and the rebellion of Stenka Razin, a Cossack. The riot is fully described in the interesting letter of an eyewitness which is preserved in the Ashmolean Collection at Oxford. Razin devastated the country round the Volga, and continued his

depredations for three years. Alexis, however, captured him, and pardoned him on condition of his taking the oath of allegiance. He soon, however, broke out into rebellion again, and proclaimed himself the enemy of the nobles, and the restorer of the liberty of the people. By various artifices he succeeded in alluring two hundred thousand men to his standard. Astrakhan was surrendered to him, and he ruled from Nijni-Novgorod to Kazan. He was, however, like Pugatcheff in the reign of Catherine II., a vulgar robber and nothing more. His atrocities disgusted the more respectable of his adherents; his forces were gradually dispersed, and in 1671 he was taken to Moscow and executed. The czar Alexis died in 1676 in his forty-eighth year. One of the most eminent men of his reign was Ordin-Nastchokin, who negotiated the peace of Andruszowo. Alexis was a man of broad views, and made many efforts to raise Russia to the level of a European power, by sending competent men as ambassadors to foreign parts, and developing the trade of the country. In these respects he resembled Boris Godunoff. Altogether his reign was one of distinct progress for Russia.

He was succeeded by his eldest son Feodor, by his first Feodor wife Maria Miloslavskaia. Feodor (1676-1682) was a III prince of weak health, and his reign was uneventful. A notable occurrence was the destruction of the *rozriadnye knigi*, or books of pedigrees. According to the *miestnichestvo* no man could take any office which was inferior to any which his ancestors had held, or could be subordinate to any man who reckoned fewer ancestors than himself. Feodor, however, finding to what interminable quarrels these pedigrees gave rise, both at court and in the camp, hit upon a bold plan, said to have been suggested by his minister Vasilii Golitzin. He caused all the families to deliver their pedigrees into court that they might be examined, under pretext of ridding them of any errors which might have crept in. The nobles were convoked; and the czar, assisted by the clergy, caused their books to be burned before their eyes.

On the death of Feodor, there seemed every probability that the empire would fall into a complete state of anarchy. The czar Alexis had been twice married: his first wife Maria Miloslavskaia bore him two sons, Feodor and Ivan, and several daughters; his second, Natalia Narishkina, was the mother of Peter and a daughter Natalia. The court was rent by the rival factions of the Miloslavskis and the Narishkins. Ivan was even more infirm than Feodor, and the Narishkins strove to bring it about that he should be set aside and Peter should be elected. Sophia, however, Sophia the daughter of Alexis by his first wife, was a woman of singular energy of character, the more remarkable on account of the little attention paid to the education of women in Russia and the cloistered and spiritless lives they were compelled to lead. According to some accounts she was a woman altogether wanting in personal attractions. Perry, however, the engineer employed by Peter the Great, speaks of her as good-looking. But the position of the women of the imperial family was even worse than that of the generality; they were not allowed to marry subjects, and in consequence the majority of them led a life of enforced celibacy. Sophia was the favourite daughter of her father, and was assiduous in her attentions to him during his last illness. One of her brothers being an imbecile and the other a child, she hoped to wield the sceptre. She fomented a revolt of the *streltzi*, and, instigated by her harangues, they murdered some of the family and partisans of the Narishkins. Not content with slaying one of the czarina's brothers at the beginning of the rebellion, they afterwards dragged another from his hiding-place and cut him to pieces.

The result of all these disturbances was that Ivan and

Ivan and Peter were declared joint-sovereigns, and Sophia was to be regent during their minority. She appointed Vasilii Golitzin to be commander-in-chief of the forces. He marched against the Mongols of the Crimea, but owing to the length of the journey and sufferings of the troops was able to effect but little. In 1689 Peter married Eudokia Lopukhina; but the union was by no means a happy one. Two sons were born to Peter, Alexander and Alexis; the first lived six months only, the latter survived to make a sad figure in Russian history. Next we have another revolt of the *streltzi*, said to have been instigated by Sophia and Golitzin. It is even alleged that the object of this conspiracy was to put Peter to death. His cause, however, prevailed, and the rebels were punished with great severity. Golitzin's life was spared, but all his property was taken from him. Sophia was now permanently incarcerated in a convent under the name of Susanna, where she remained till her death fifteen years afterwards, at the age of forty-six. Thus from 1689 dates the actual rule of Peter. His brother Ivan, infirm both in body and mind, had but little share in the government; his faculties both of sight and speech are said to have been very imperfect. He took a wife, however, and had three daughters, concerning one of whom, at least, we have much more to hear. Ivan led a retired life, and died in 1696 at the age of thirty.

Peter the Great.

Want of space compels us to deal here only with the leading facts of the reign of Peter the Great (1689-1725); for more minute details the reader must consult the special article (vol. xviii. p. 698). The great object of the new czar was to give Russia ports in some other direction than the White Sea, constantly blocked with ice. He had already trained an army which was officered by foreigners in his pay. The Turks were the first objects of his attack. At first he was unsuccessful in his attempt to get possession of Azoff at the mouth of the Don,—partly on account of the treason of the Dutch engineer Jansen, who, in consequence of some slight put upon him, went over to the enemy. In 1696, however, he took the fort and soon afterwards made his triumphant entry into Moscow. In the following year Peter, accompanied by Lefort and Generals Golovin and Vosnitsin, set out on his travels. For some time he worked at the docks of Saardam in Holland, and then he went to England, where he remained three months. The story of his stay at Deptford is too well known to need description here. He left England, taking with him a great number of ingenious men, who were appointed to teach the arts to the barbarous Russians. He was getting ready to go to Venice when he heard of the great revolt of the *streltzi*. Before his arrival their insurrection had been quelled by Gordon and others, and many of them lay in prison awaiting the sentences to be given by Peter. When he reached Moscow, a series of terrible executions took place, which have been described with only too much accuracy by some eyewitnesses, the chief being Korb, the secretary of the German embassy. In 1706 broke out the revolt of the Cossacks of the Don, and in 1709 that of Mazeppa, the hetman of the Little-Russian Cossacks, who eagerly joined Charles XII. in his struggle with Peter. As early as 1700 the Russian czar had carried on war with this last of the vikings, as he had been called. In that year Charles defeated Peter at the battle of Narva, but the latter, although humbled, was not disheartened. He gathered all his strength for another encounter. In the following year Sheremetreff defeated the Swedish general Schlippenbach in Livonia, and again in 1702. The great object of Peter was to gain possession of the Neva; this he attained, but the Russian arms were disgraced by many cruelties and robberies in the unfortunate Baltic provinces, which had already suffered so much in the wars of Ivan the Terrible.

Charles XII. now abandoned his attacks on the Polish king and invaded Russia. "I will treat with the czar at Moscow," he said. Peter replied, "My brother Charles wishes to play the part of Alexander, but he will not find me Darius." At Lesna the Swedish general Löwenhaupt fought a desperate battle with the Russians, in which, although nominally victorious, his losses were terrible. On June 15 (N.S.) was fought the battle of Poltava, which resulted in the complete defeat of Charles. He had brought it on by his recklessness, and, it may be added, complete ignorance of his duties as a general.

With the fall of Mazeppa and the coalition of the Little Russians in aid of Charles fell also the independence of the Cossacks and their *sech* or republic. They now became entirely dependent upon the Muscovite czar. The hetmanship, which had long been a mere empty title, lasted till the year 1789. In 1712 Peter married Marthe Skavronska, a Livonian or Lithuanian peasant who had been taken prisoner at the siege of Marienburg in 1702. But little is known of her previous history; she received the name of Catherine on being baptized as a member of the Greek Church. Peter had previously divorced his wife Eudokia, who was distasteful to him on account of her sympathies with the conservative party in Russia. He now set about his great plan of civilizing the country on the model of the nations of the West. In this he was assisted by many foreigners in his pay. He abolished the patriarchate, probably from dislike of its great power, based nobility entirely upon service either civil or military, and divided the merchants into guilds, but left serfdom still existing in Russia, or perhaps we may say with truth even augmented it, by doing away with the privileges which the *odnodvortzi* and *polovniki* had and confounding all in a common category of serfdom. His attempt to introduce primogeniture into Russia did not succeed. He put an end to the Oriental seclusion of women and the Oriental dress of men; for the beard and long caftan were substituted the cleanly-shaved face and the dress in vogue in the West. He abolished also the *pravezhe* or public flagellation of defaulting debtors. The army was completely remodelled on the European system. During the exile of Charles XII. at Bender Peter drove Stanislaus Leszczynski out of Poland, and Augustus II. re-entered Warsaw. Peter conquered Esthonia and Livonia. He was not able to annex Courland, which was a feudatory of Poland, but he negotiated a marriage between the duke and his niece Anna, daughter of the late czar Ivan, who was afterwards empress. A foolish expedition undertaken against Turkey was not successful. Peter found himself but ill-supported by the inhabitants through whose territory he marched, and was compelled to sign the treaty of the Pruth in 1711, whereby he gave back Azoff, one of his most valuable conquests, to the Turks. The story of his having been rescued by the dexterity of Catherine seems to lack confirmation; under any circumstances, he shortly afterwards acknowledged her as his wife. In May 1713 Peter gained some fresh victories over the Swedes. In 1717 he made another European tour, visiting, among other places, Paris. On this occasion he was accompanied by his wife; concerning both strange stories were told, but perhaps we must be cautious how we receive too credulously, as Carlyle has done, the malicious gossip of the margravine of Baireuth. In 1721, by the treaty of Nystad with Sweden, Peter was left master of Livonia, Esthonia, Ingria, and part of Finland. He had begun building St Petersburg, "the window by which Russia looks" at Europe, as early as 1703.

In 1722 we find Peter descending the Volga from Nijni to Astrakhan, and gaining some important points on that river. Previous to this had occurred the sad death

of his son Alexis, in which it must be said with sorrow Peter seemed lost to all the feelings of a father. Alexis had undoubtedly given him great cause for dislike by identifying himself in every way with the retrogressive party. The unfortunate young man probably died under the infliction of torture. In 1721 Peter promulgated the celebrated ukaze (afterwards abrogated by Paul) that the sovereign had the right of naming his successor. On January 28, 1725, the great reformer was dead. An attempt to estimate his character has been made in the separate article assigned to him.

Catherine
I.

On the death of Peter the country was divided into two factions. The old reactionary party, the Golitzins, Dolgorukis, and others, were eager to proclaim Peter the son of Alexis, but those who had identified themselves with the reforms of the late sovereign were anxious that Catherine his widow, who had been crowned empress, should succeed. Menshikoff, the favourite of the late czar, who is said when a boy to have sold cakes in the streets of Moscow, became all-powerful at this period, and the reforms of Peter continued to be carried out. Catherine died in 1727; she appears to have been an indolent, good-natured woman, with but little capacity for government, and accordingly, throughout her short reign, was entirely controlled by others. She designated as her successor Peter the son of Alexis, and, in default of Peter and his issue, Anna, who had married the duke of Holstein, and Elizabeth, her daughters. The regency was exercised by a council consisting of the two daughters, the duke of Holstein, Menshikoff, and seven or eight of the chief dignitaries of the empire. Menshikoff was still all-important; he had obtained from Catherine her consent to a marriage between his daughter and the youthful czar. But his authority was gradually undermined by the Dolgorukis. The favourite of Peter the Great was first banished to his estates, and afterwards to Berezoff in Siberia, where he died in 1729. The Dolgorukis were now in the ascendancy, and the czar was betrothed to Natalia, one of that family. He showed every inclination to undo his grandfather's work, and the court was removed to Moscow. Soon afterwards, however, in January 1730, the young prince died of small-pox. His last words as he lay on his death-bed were, "Get ready the sledge; I want to go to my sister,"—alluding to the Princess Natalia, the other child of Alexis, who had died three years previously. The only foreign event of importance in this reign was the attempt of Maurice of Saxony to get possession of Courland, by marrying the duchess Anna, then a widow. She consented to the union, and the states of the province elected him, but Menshikoff sent a body of troops who forced him to quit it. On the death of Peter at the age of fifteen, various claimants of the throne were put forward. The great czar had left two daughters, Elizabeth, and Anna, duchess of Holstein, who had a son, afterwards Peter III. Two daughters were also surviving of his eldest brother Ivan, Anna, the duchess of Courland, and Catherine, duchess of Mecklenburg. Alexis Dolgoruki even had an idea of claiming the crown for his daughter, because she had been betrothed to the young emperor. This proposal, however, was treated with derision, and the High Secret Council resolved to call to the throne Anna of Courland, thinking that, as she was so much more remote by birth than the daughters of Peter, she would more willingly submit to their terms. In fact, they had prepared for her signature something like the *pacta conventa* of Poland. The following were the terms:—(1) the High Council was always to be composed of eight members, to be renewed by co-optation, and the czarina must consult it on state affairs; (2) without its consent she could neither make peace nor declare war, could not impose any tax,

Peter II.

alienate any crown lands, or appoint to any office above that of a colonel; (3) she could not cause to be condemned or executed any member of the nobility, nor confiscate the goods of any noble before he had a regular trial; (4) she could not marry nor choose a successor without the consent of the council. In case she broke any of these stipulations she was to forfeit the crown (see Rambaud, p. 425). Anna assented to these terms and made her entry into Moscow, which was now to be the capital. But the empress was soon informed how universally unpopular these *pacta conventa* were, which in reality put Russia into the hands of a few powerful families, chiefly the Dolgorukis and Golitzins. She accordingly convened her supporters, and publicly tore the document to pieces, and thus ended the last attempt to give Russia a constitution. The new empress was a cold, repulsive woman, whose temper had been soured by indignities endured in her youth; she took vengeance upon her opponents, and threw herself almost entirely into the hands of German advisers, especially Biren, a Courlander of low origin. This is the period called by the Russians the *Bironovschina*. The country was now thoroughly exploited by the Germans; some of the leading Russians were executed, and others banished to Siberia. Among the former was the able minister Volinski, beheaded with two others in 1740. He had fallen under the wrath of the implacable Biren. One of the most important enactments of this reign was the abolition of the right of primogeniture introduced by Peter the Great, which had never been popular in the country. On the crown of Poland falling vacant in 1733, an attempt was again made to place Stanislaus Leszczynski on the throne, but it failed through the opposition of Russia, and Stanislaus escaped with difficulty from Dantzic. Upon this followed a war with Turkey, which lasted four years (1735–1739), in conjunction with Austria. This was not very successful, but the Russian generals gained possession of a few towns, and were indignant when the Austrians signed the treaty of Belgrade with the Turks (1739), and the campaign came to an end. In 1740 the empress Anna died; she had reigned exactly ten years. She left the crown to Ivan, the son of her niece Anna, daughter of her sister Catherine, duchess of Mecklenburg. During the minority of this child Biren was to be regent. By a *revolution de palais*, however, the German adventurer was hurled from power and sent to Pél'm in Siberia. But matters did not rest here; taking advantage of the general unpopularity of the German faction, the partisans of Elizabeth, the daughter of Peter the Great, were resolved to work their overthrow, and place her upon the throne. They consisted of Alexander and Peter Shuvaloff, Michael Vorontzoff, Razumovski, Schwarz, and a French surgeon named Lestocq. Elizabeth ingratiated herself into the favour of the soldiers, by whom the name of Peter the Great was still so much cherished. Anna Leopoldovna, as she was called, her husband Anthony Ulrich, the infant emperor, Munich, Ostermann, and the whole German faction were arrested in the night, and Elizabeth ascended the throne. Ivan VI. was imprisoned in the fortress of Schlüsselburg; Anna, with her husband and children, was banished to Kholmogor near Archangel, where she died in 1746. Ostermann was banished to Berezoff, and Munich to Pél'm; they had both been previously sentenced to death. Biren and his family were now recalled and allowed to live at Yaroslavl. Elizabeth Petrovna (1741–1762) inaugurated the return of Russian influence in opposition to the Germans, from whom the country had suffered so much during the reign of Anna. The people were weary of them, yet they were, as we shall see, to have one German emperor more. On ascending the throne she summoned to her court the son of her sister

Anna.

Elizabeth

Anna and the duke of Holstein, who took the name of Peter Feodorovich on assuming the Greek religion, and was declared heir to the throne. In 1744 he married the Princess Sophia of Anhalt-Zerbst, who by her baptism in the Orthodox Church became Catherine. Thus the line of descent was secured to the direct heirs of Peter the Great. In 1743, the armies of Elizabeth having gained some victories over the Swedes, the treaty of Åbo was signed, by which Russia acquired the southern part of Finland, as far as the river Kiumen. The next event of importance is the war between Russia and Frederick the Great (1756-1762). In 1757 Apraksin crossed the frontier with 85,000 Russians, occupied Eastern Prussia, and defeated Lewald at Gross-Jägersdorf; but, instead of taking advantage of the victory, he soon afterwards retired behind the Niemen, having been tampered with by the grand-duchess Catherine and the chancellor Bestuzheff-Riumin. In 1758 Fermor, the Russian general, was completely defeated by Frederick at Zorndorf, but he was allowed to retreat without molestation. In 1759 Saltykoff beat the Prussians at Paltzig, and in the same year Frederick was obliged to submit to a greater defeat at Künersdorf, where he lost eight thousand men and one hundred and seventy-two cannon. It was on the loss of this battle that he meditated committing suicide. In 1760 the Russians entered Berlin, where they committed great havoc and destruction. "We have to do," said Frederick, "with barbarians, who are digging the grave of humanity." In the following year they took Pomerania. The cause of Frederick seemed on the verge of ruin; he was saved by the death of Elizabeth in December 1761. The empress was an idle, superstitious woman of lax morals, who was greatly under the influence of favourites. Since the reign of Peter I. no successor had appeared worthy of him. Still Russia made more progress under Elizabeth than it had made under Anna. In 1755 the university of Moscow, the oldest in the country, was founded through the influence of Ivan Shuvaloff. Literature made great advances, as will be seen below.

Peter III.

Elizabeth was succeeded by her nephew Peter, son of her sister Anna and Charles Frederick, duke of Holstein-Gottorp. He was suspected of German leanings, but his first measures made him very popular. In February 1762 he published an ukaze by which the nobility were freed from the necessity of entering upon any state employment, and he abolished the secret chancery. On the other hand he acted in some matters injudiciously, and offended the prejudices of the Russians, as the false Demetrius had done a century and a half previously. He ridiculed some of the ceremonies of the Orthodox Church, and showed a fondness for the Lutheran. He introduced many German tactics into the army, and evinced a great preference for his German corps of Holsteiners. His personal habits were very coarse: he was constantly seen drunk. Moreover he sent out of the country many of the talented Frenchmen who had during the reign of Elizabeth been helping Russia to get rid of her barbarism. Frederick II. of Prussia, who was at his lowest depths after the battle of Künersdorf, now saw to his delight a complete change in the Russian policy. Peter was an ardent admirer of the Prussian sovereign; in order to ensure peace, Frederick would have ceded Eastern Prussia; but Peter dreamed of nothing of the kind; he restored all the Russian conquests and formed an alliance with him, offensive and defensive. He lived very unhappily with his wife Catherine, and meditated divorcing her and imprisoning her for the rest of her life in a convent. The condition in which she passed her time may be seen from her memoirs, first published by Herzen, the authenticity of which there seems to be no reason to doubt. She, however, quietly waited her time, and a conspiracy was concocted in which she was assisted by the

Orloffs, Potemkin, the princess Dashkoff, and others (see PETER III.). Leaving her residence at Peterhof, Catherine boldly put herself at the head of twenty thousand men. The miserable emperor abdicated without a struggle, and was soon afterwards secretly assassinated at Ropcha, near St Petersburg. Many of the details of this catastrophe are given in the interesting memoirs of the Princess Dashkoff, which were published by an English lady, Mrs W. Bradford, in 1840, having been taken down from her dictation. Thus had a German woman, by adroitly flattering the prejudices of the Russians, succeeded in making herself head of this vast empire. Two years afterwards Ivan VI., who is said to have become an idiot from his long confinement at Schlüsselburg, was murdered by his guards on account of the attempt of a certain Lieutenant Mirovich to set him free. Whether Mirovich was incited to this adventure by secret promises of the Government, so that there might be an excuse for the murder of Ivan, has never been clearly shown. He expiated his crime by public execution, and is said to have expected a reprieve till the last moment.

The Seven Years' War was now over, and the next great European complications were to be concerned with the partition of Poland, throughout the struggles of which country the Russians were constantly interfering; but for a fuller discussion of this subject the reader must be referred to the article POLAND. In 1767 Turkey, urged on by France, declared war against Russia; the object was to aid the Poles by creating a diversion. The Russian general Golitzin attacked the grand vizier, took the town of Khotin (1769), and in the following year Rumantsoff defeated the khan of the Crimea, the Turkish feudatory and ally, and in 1770 won the great victory of Kagul. In 1771 Dolgoruki overran the Crimea, and Alexis Orloff defeated the Turks in a naval engagement at Chesme, on the coast of Asia Minor. In their naval expeditions the Russians were at this time greatly assisted by the number of Englishmen in their service. In 1774 was signed the peace of Kutchuk-Kainardji, whereby the sultan acknowledged the independence of the Mongols of the Crimea. The Russians thus detached this province from the sultan's dominions, and after exercising a kind of protectorate over it added it to their own. He also ceded Azoff on the Don, Kinburn at the mouth of the Dnieper, and all the fortified places of the Crimea. The Greeks, who had been induced to rise, were abandoned to the vengeance of the Turks.

In 1771 the plague broke out at Moscow, and many of the inhabitants perished. The archbishop Ambrose was massacred in a popular tumult, while endeavouring to carry out some measures which were necessary for the preservation of the public health. Soon afterwards occurred the rebellion of Pugatcheff, a Cossack of the Don, who declared himself to be the emperor Peter III. The czar, he alleged, had escaped from the hands of his would-be murderers, and would soon regain his throne. A large band of disaffected peasants and Raskolniks gathered round him, and he was joined by many of the Mongol races, who were inimical to the Russian rule. At first the generals sent against him were defeated. The rebel's path was everywhere marked with bloodshed and pillage; he even got possession of several towns, including Kazan. Had he been something more than a vulgar assassin he might have made Catherine tremble on her throne, but his cruelties estranged his more moderate followers. He was afterwards beaten by Bibikoff and others, and finally surrendered by his accomplices to Suwaroff. He was taken to Moscow in an iron cage and there publicly executed in 1775, together with four of his principal followers. In the same year the empress put an end to the republic, as it was called, of the Zaporogian Cossacks. A great codification of the laws took place under Catherine, which may be

styled the sixth great period of Russian legislation. The serfs, however, were not benefited by these changes. In 1767 an ukaze forbade them to bring any complaints against their masters. The latter had the power of sending their serfs to Siberia as a punishment, or handing them over to be enlisted in the army. The public sale of serfs was not put an end to till the reign of Alexander I. The country was now divided into governments for the better administration of justice, each government being subdivided into *uezdi* or districts. Catherine also took away from the monasteries their lands and serfs, and allotted them payments according to their importance from the state revenues. The plans of Peter I. were thus fully carried out, and the church became entirely dependent upon the state. In 1783 the Crimea was annexed to Russia. A second war with Turkey broke out in 1787; the Ottoman power had many grounds of complaint, but its suspicions were particularly aroused by the tour of Catherine through the southern provinces of Russia and her interviews with the emperor Joseph II. Turkey declared war that same year; and, to increase the embarrassed position of the empress, Sweden did the same, requiring from Russia the cession of the southern part of Finland which had been taken from her. But King Gustavus III., in spite of some petty successes, was unable to carry on the war, and soon signed the peace of Verela on the footing of *status quo ante bellum*. The empress met with equal good fortune in the south; Potemkin took Otchakoff and Suwaroff Khotin. In 1789 the latter general won the battles of Fokshani and Rimnik; and in 1790 after a sanguinary engagement he took Ismail. By the treaty of Jassy in 1792 Catherine kept possession of Otchakoff, and the shore between the Bug and Dniester. She was next occupied with the affairs of Poland, which have been described under that heading. In consequence of the demands of the confederates of Targovica,—men who were prepared to ruin their country for their own private ends,—eighty thousand Russians and twenty thousand Cossacks entered the Ukraine to undo the work of the confederates of Bar. In 1794 Suwaroff stormed Warsaw, and the inhabitants were massacred. In the following year Stanislaus Poniatowski laid down his crown, the third division of Poland took place, and the independence of that country was at an end. In spite of her correspondence and affected sympathies with Voltaire, Diderot, and many of the advanced French thinkers, Catherine showed great opposition to the principles of the French Revolution, and the policy of the latter part of her reign was reactionary. She died suddenly on November 17, 1796. Her character has been amply discussed by foreign writers. It may suffice to say here that, whatever her private vices may have been, she was unquestionably a woman of great genius, and the only sovereign worthy of Russia who had appeared since the days of Peter the Great. Hence the veneration with which her memory is regarded by the Russians to this day.

Paul, who had lived in retirement during the life of his mother, was an object of aversion to her. We are told that she had prepared a will by which he would be disinherited, and the succession conferred upon his son Alexander, but his friend Kurakin got hold of it immediately upon the death of the empress and destroyed it. The events of the reign of PAUL (*q.v.*) can be only briefly discussed here. He concluded an alliance with Turkey, and entered into a coalition against the French republic, which he regarded with horror. Suwaroff took the command of the united Russian and Austrian troops at Verona. In 1799 he defeated the French general Moreau on the banks of the Adda, and made a triumphant entry into Milan. After this he won another victory over Macdonald on the Trebbia,

and later the same year that of Novi over Joubert. He then crossed the Alps for the purpose of driving the French out of Switzerland, but he was everywhere hampered by the Austrians, and, after fighting his way over the Alps and suffering great losses, he reached his winter quarters between the Iller and the Lech, and soon afterwards he was recalled in disgrace. Paul now completely changed his tactics. Accusing England and Austria of having acted treacherously towards him, he threw himself into the arms of Bonaparte, who had won him over by skilful diplomacy, and, among other pieces of flattery, sent back the Russian prisoners newly clothed and armed. Paul then meditated joining him in a plan for conquering India; but in the night between the 23d and 24th of March 1801 he was assassinated. The chief agents in this catastrophe were Plato Zuboff, Benning-sen, and Pahlen. The rule of Paul had become intolerable, and he was fast bringing on a national bankruptcy.

He was succeeded by his eldest son, Alexander I. Alexander (1801–1825). One of the first acts of the new emperor I. was to make peace with England and France. He, however, soon changed his policy, and in 1805 joined the third coalition against France, to which Austria and England were parties. Events which belong to general European history, and are well known, need only be described briefly here. On December 2d of that year took place the battle of Austerlitz, in which the Russians lost 21,000 men, 133 guns, and 30 flags. They accused their Austrian allies of treachery. The war was soon ended by the treaty of Pressburg. We now come to the fourth coalition against France (1806–7). In 1807 Napoleon engaged the Russian general Benningsen at Eylau. The battle was protracted and sanguinary, but not decisive; both parties abandoned the field and retired into winter quarters. A defeat at Friedland in the same year was followed by the peace of Tilsit. By this treaty the Prussian king, Frederick William III., lost half his dominions. Nearly all his Polish possessions were to go to the king of Saxony under the name of the grand-duchy of Warsaw. By a secret treaty, it seemed as if Alexander and Napoleon almost aspired to divide the world, or at least Europe, between them. The terms, however, were received by a large party in Russia with disgust. The next important event in the reign of Alexander was the conquest of Finland. By the treaty of Frederikshamn, September 17, 1809, Sweden surrendered Finland, with the whole of East Bothnia, and a part of West Bothnia lying eastward of the river Torneå. The Finns were allowed a kind of autonomy, which they have preserved to this day. The annexation of Georgia to Russia was consolidated at the beginning of this reign, having been long in preparation. It led to a war with Persia, which resulted in the incorporation of the province of Shirvan with the Russian empire in 1806.

In 1809 commenced the fifth coalition against Napoleon. Alexander, who was obliged by treaty to furnish assistance to the French emperor, did all that he could to prevent the war. A quarrel with Turkey led to its invasion by a Russian army under Michelsen. This war was terminated by a congress held at Bucharest in 1812. Russia gave up Moldavia and Wallachia, which she had occupied, but kept Bessarabia, with the fortresses of Khotin and Bender. Gradually an estrangement took place between Alexander and Napoleon, not only on account of the creation of the grand-duchy of Warsaw, but because Russia was suffering greatly from the Continental blockade, to which Alexander had been forced to give his adhesion. This led to the great invasion of Russia by Napoleon in 1812.¹

¹ This has been fully described in the pages of Eugène Labaume and Sir Robert Wilson. In the recent volumes of the excellent review, *Russki Arkhiv*, edited by M. Bartenieff, will be found some most interesting details based upon Russian family papers and traditions.

On May 9, 1812, Napoleon left Paris for Dresden, and the Russian and French ambassadors received their passports. The grand army comprised 678,000 men, 356,000 of them being French; and, to oppose them, the Russians assembled 372,000 men. Napoleon crossed the Niemen and advanced by forced marches to Smolensk. Here he defeated the Russians, and again at the terrible battle of Borodino, and then entered Moscow, which had been abandoned by most of the inhabitants; soon afterwards a fire broke out (probably caused by the order of Rostopchin the governor), which raged six days and destroyed the greater part of the city. Notwithstanding this disaster, Napoleon lingered five weeks among the ruins, endeavouring to negotiate a peace, which he seemed to think Alexander would be sure to grant; but he had mistaken the spirit of the emperor and his people. On the 18th of October Napoleon reluctantly commenced his backward march. The weather was unusually severe, and the country all round had been devastated by the French on their march. With their ranks continually thinned by cold, hunger, and the skirmishes of the Cossacks who hung upon their rear, the French reached the Beresina, which they crossed near Studianka on the 26th-29th of November with great loss. The struggle on the banks of this river forms one of the most terrible pictures in history. At Smorgoni, between Vilna and Minsk, Napoleon left the army and hurried to Paris. Finally the wreck of the *grande armée* under Ney crossed the Niemen. Not more than eighty thousand of the whole army are said to have returned.

Frederick William III. of Prussia now issued a manifesto, and concluded an alliance with Russia for the re-establishment of the Prussian monarchy. In 1813 took place the battle of Dresden, and the so-called Battle of the Nations at Leipsic on October 16 and the two following days. In 1814 the Russians invaded France with the allies, and lost many men in the assault upon Paris. After the battle of Waterloo, and the conveyance of Napoleon to the island of St Helena, it fell to the Russian forces to occupy Champagne and Lorraine. In the same year Poland was re-established in a mutilated form, with a constitution which Alexander, who was crowned king, swore to observe. In 1825 the emperor died suddenly at Taganrog at the mouth of the Don, while visiting the southern provinces of his empire. He had added to the Russian dominions Finland, Poland, Bessarabia, and that part of the Caucasus which includes Daghestan, Shirvan, Mingrelia, and Imeretia. Much was done in this reign to improve the condition of the serfs. The Raskolniks were better treated; many efforts were made to improve public education, and the universities of Kazan, Kharkoff, and St Petersburg were founded. One of the chief agents of these reforms was the minister Speranski, who for some time enjoyed the favour of the emperor, but he attacked so many interests by his measures that a coalition was formed against him. He was denounced as a traitor, and his enemies succeeded in getting him removed and sent as governor to Nijni-Novgorod. In 1819, when the storm raised against him had somewhat abated, he was appointed to the important post of governor of Siberia. In 1821 he returned to St Petersburg, but he never regained his former power. To the mild influence of Speranski succeeded that of Shishkoff, Novosiltzeff, and Arakcheeff. The last of these men made himself universally detested in Russia. He rose to great influence in the time of Paul, and managed to continue in favour under his son. Besides many other pernicious measures, it was to him that Russia owed the military colonies which were so unpopular and led to serious riots. The censorship of the press became much stricter, and

many professors of liberal tendencies were dismissed from their chairs in the universities. The country was now filled with secret societies, and the emperor became gloomy and suspicious. In this condition of mind he died, a man thoroughly disenchanted and weary of life. He has been judged harshly by some authors; readers will remember that Napoleon said of him that he was false as a Byzantine Greek. To us he appears as a well-intentioned man, utterly unable to cope with the discordant elements around him. He had discovered that his life was a failure.

The heir to the throne according to the principles of succession recognized in Russia was Constantine, the second son of the emperor Paul, since Alexander left no children. But he had of his own free will secretly renounced his claim in 1822, having espoused a Roman Catholic, the Polish princess Julia Grudzinska. In consequence of this change in the devolution of the sovereign's authority, the conspiracy of the Dekabrist¹ broke out at the end of the year, their object being to take advantage of the confusion caused by the alteration of the succession to get constitutional government in Russia. Their efforts failed, but the rebellion was not put down without great bloodshed. Five of the conspirators were executed, and a great many sent to Siberia. Some of the men implicated were among the most remarkable of their time in Russia, but the whole country had been long honeycombed with secret societies, and many of the Russian officers had learned liberal ideas while engaged in the campaign against Napoleon. So ignorant, however, were the common people of the most ordinary political terms that when told to shout for Constantine and the constitution (*constitutzia*) they naively asked if the latter was Constantine's wife. The new emperor, Nicholas, the next brother in succession, Nicholas, showed throughout his reign reactionary tendencies; all liberalism was sternly repressed. In 1830 appeared the *Complete Collection of the Laws of the Russian Empire*, which Nicholas had caused to be codified. He partly restored the right of primogeniture which had been taken away by the empress Anna as contrary to Russian usages, allowing a father to make his eldest son his sole heir. In spite of the increased severity of the censorship of the press, literature made great progress in his reign. From 1826 to 1828 Nicholas was engaged in a war with Persia, in which the Russians were completely victorious, having beaten the enemy at Elizabetpol, and again under Paskewitch at Javan Bulak. The war was terminated by the peace of Turkmanchai (February 22, 1828), by which Persia ceded to Russia the provinces of Erivan and Nakhitchevan, and paid twenty millions of roubles as an indemnity. The next foreign enemy was Turkey. Nicholas had sympathized with the Greeks in their struggle for independence, in opposition to the policy of Alexander; he had also a part to play as protector of the Orthodox Christians, who formed a large number of the sultan's subjects. In consequence of the sanguinary war which the Turks were carrying on against the Greeks and the utter collapse of the latter, England, France, and Russia signed the treaty of London in 1827, by which they forced themselves upon the belligerents as mediators. From this union resulted the battle of Navarino (October 20, 1827), in which the Turkish fleet was annihilated by that of the allies. Nicholas now pursued the war with Turkey on his own account; in Asia Paskewitch defeated two Turkish armies, and conquered Erzeroum, and in Europe Diebitsch defeated the grand vizier. The Russians crossed the Balkans and advanced to Adrianople, where a treaty was signed in 1829, very disadvantageous to Turkey.

In 1831 broke out the Polish insurrection, of which a

¹ Literally, the men of December, the month in which Alexander died.

description has already been given (see POLAND, vol. xix. p. 298). Paskewitch took Warsaw in 1831. The cholera which was then raging had already carried off Diebitsch and the grand-duke Constantine. Poland was now entirely at the mercy of Nicholas. The constitution which had been granted by Alexander was annulled; there were to be no more diets; and for the ancient palatinates, familiar to the historical student, were substituted the governments of Warsaw, Radom, Lublin, Plock, and Modlin. The university of Vilna, rendered celebrated by Mickiewicz and Lelewel, was suppressed. By another treaty with Turkey, that of Unkiar-Skelessi (1833), Russia acquired additional rights to meddle with the internal politics of that country. Soon after the revolution of 1848, the emperor Nicholas, who became even more reactionary in consequence of the disturbed state of Europe, answered the appeal of the emperor Francis Joseph, and sent an army under Paskewitch to suppress the Hungarian revolt. After the capitulation of Görgei in 1849, the war was at an end, and the Magyars cruelly expiated their attempts to procure constitutional government. In 1853 broke out the Crimean War. The emperor was anxious to distribute the possessions of the "sick man," but found enemies instead of allies in England and France. The chief events of this memorable struggle were the battles of the Alma, Balaklava, Inkermann, and Tchernaya, and the siege of Sebastopol; this had been skilfully fortified by Todleben, who appears to have been the only man of genius who came to the front on either side during the war. In 1855 the Russians destroyed the southern side of the city, and retreated to the northern. In the same year, on March 2nd, died the emperor Nicholas, after a short illness. Finding all his plans frustrated he had grown weary of life, and rashly exposed himself to the severe temperature of the northern spring.

Alexander
II.

He was succeeded by his son Alexander II. (1855-1881), at the age of thirty-seven. One of the first objects of the new czar was to put an end to the war, and the treaty of Paris was signed in 1856, by which Russia consented to keep no vessels of war in the Black Sea, and to give up her protectorate of the Eastern Christians; the former, it must be added, she has recently recovered. A portion of Russian Bessarabia was also cut off and added to the Danubian principalities, which were shortly to be united under the name of Roumania. This was afterwards given back to Russia by the treaty of Berlin. Sebastopol also has been rebuilt, so that it is difficult to see what the practical results of the Crimean War were, in spite of the vast bloodshed and expenditure of treasure which attended it. The next important measure was the emancipation of the serfs in 1861. This great reform had long been meditated by Nicholas, but he was unable to accomplish it, and left it to be carried out by his son. The landlords, on receiving an indemnity, now released the serfs from their seigniorial rights, and the village commune became the actual property of the serf. This great revolution was not, however, carried out without great difficulty. The Polish insurrection of 1863 has already been described, as well as its fatal effects upon that part of Poland which had been incorporated with Russia. On the other hand Finland has seen her privileges confirmed.

Among important foreign events of this reign must be mentioned the capture of Schamyl in 1859 by Prince Bariatinski, and the pacification of the Caucasus; many of the Circassians, unable to endure the peaceful life of cultivators of the soil under the new regime, migrated to Turkey, where they have formed one of the most turbulent elements of the population. Turkestan also has been gradually subjugated. In 1865 the city of Tashkend was taken, and in 1867 Alexander II. created the government of Turkestan. In 1858 General Muravieff signed a treaty

with the Chinese, by which Russia acquired all the left bank of the river Amur. A new port has been created in Eastern Asia (Vladivostok), which promises to be a great centre of trade. In 1877 Russia came to the assistance of the Slavonic Christians against the Turks. After the terrible siege of Plevna, nothing stood between them and the gates of Constantinople. In 1878 the treaty of San Stefano was signed, by which Roumania became independent, Servia was enlarged, and a free Bulgaria, but under Turkish suzerainty, was created. But these arrangements were subsequently modified by the treaty of Berlin. Russia got back the portion of Bessarabia which she had lost, and advanced her Caucasian frontier. The new province of Bulgaria was cut into two, the southern portion being entitled Eastern Roumelia, with a Christian governor, to be appointed by the Porte, and self-government. Austria acquired a protectorate over Bosnia and Herzegovina. The latter part of the reign of Alexander II. was a period of great internal commotion, on account of the spread of Nihilism, and the attempts upon the emperor's life, which unfortunately were at last successful. In the cities in which his despotic father had walked about fearless, without a single attendant, the mild and amiable Alexander was in daily peril of his life. On April 16, 1866, Karakozoff shot at the emperor at St Petersburg; in the following year another attempt was made by a Pole, Berezowski, while Alexander was at Paris on a visit to Napoleon III.; on April 14, 1879, Solovieff shot at him. The same year saw the attempt to blow up the Winter Palace and to wreck the train by which the czar was travelling from Moscow to St Petersburg. A similar conspiracy in 1881 (March 13) was successful. Five of the conspirators, including a woman, Sophia Perovskaia, were publicly executed. Thus terminated the reign of Alexander II., which had lasted nearly twenty-six years. He died leaving Russia exhausted by foreign wars and honeycombed by plots. His wife and eldest son Nicholas had predeceased him, the latter at Nice. He was succeeded by his second son Alexander, born in 1845, whose reign has been characterized by conspiracies and constant deportations of suspected persons. It was long before he ventured to be crowned in his ancient capital of Moscow (1883), and the chief event since then has been the disturbed relations with England, which for a time threatened war.

(W. R. M.)

PART V.—RUSSIAN LITERATURE.

To get a clear idea of Russian literature, it will be most convenient for us to divide it into oral and written. The first of these sections includes the interesting *blini*, or *Bilini*, "tales of old time," as the word may be translated, which have come down to us in great numbers, as they have been sung by wandering minstrels all over the country. The scholars who during the last forty years have given their attention to these compositions have made the following division of them into cycles:—(1) that of the older heroes; (2) that of Vladimir, prince of Kieff; (3) that of Novgorod; (4) that of Moscow; (5) that of the Cossacks; (6) that of Peter the Great; (7) the modern period. These poems, if they may be so styled, are not in rhyme; the ear is satisfied with a certain cadence which is observed throughout. For a long time they were neglected, and the collection of them only began at the commencement of the present century. The style of Russian literature which prevailed from the time of Lomonosoff was wholly based upon the French or pseudo-classical school. It was, therefore, hardly likely that these peasant songs would attract attention. But when the gospel of romanticism was preached and the *History* of Karamzin appeared, which presented to the Russians a

past of which they had known but little, described in poetical and ornate phraseology, a new impulse was given to the collection of all the remains of popular literature. In 1804 appeared a volume based upon those which had been gathered together by Cyril or Kirsha Daniloff, a Cossack, at the beginning of the 18th century. They were received with much enthusiasm, and a second edition was published in 1818. In the following year there appeared at Leipsic a translation of many of these pieces into German, in consequence of which they became known much more widely. This little book of 160 pages is important in many ways, and not the least so because the originals of some of the *bilini* translated in it are now lost. Since that time large collections of these poems have been published, edited by Rîbnikoff, Hilferding, Sreznevski, Avenarius, and others.

These curious productions have all the characteristics of popular poetry in the endless repetitions of certain conventional phrases—the “green wine,” “the bright sun” (applied to a hero), “the damp earth,” and others. The heroes of the first cycle are monstrous beings, and seem to be merely impersonifications of the powers of nature; such are Volga Vseslavich, Mikula Selianinovich, and Sviatogor. They are called the *bogatîri starshie*. Sometimes we have the giants of the mountain, as Sviatogor, and the serpent Gorinich, the root of part of both names being *gora* (mountain). The serpent Gorinich lives in caves, and has the care of the precious metals. Sometimes animal natures are mixed up with them, as *zmei-bogatîr*, who unites the qualities of the serpent and the giant, and bears the name of Tugarin Zmievich. There is the Pagan Idol (*Idolische Poganskoe*), a great glutton, and Nightingale the Robber (*Solovei Razboinik*), who terrifies travellers and lives in a nest built upon six oaks.

In the second cycle the legends group themselves round the celebrated prince Vladimir of Kieff, in whose time the Christian religion was introduced into Russia, as previously mentioned. The chief hero is Ilya Murometz, who performs prodigies of valour, and is of gigantic stature and superhuman strength. The cycle of Novgorod deals with the stories of Vasilii Buslaevich and Sadko, the rich merchant. The great commercial prosperity of Novgorod has been already described. The fourth cycle deals with the autocracy; already Moscow has become the capital of the future empire. We are told of the taking of Kazan, of the conquest of Siberia by Yermak, of Ivan the Terrible and his confidant Maliuta Skuvlatovich. It is observable that in the popular tradition Ivan, in spite of his cruelties, is not spoken of with any hatred. As early as 1619 some of these *bilini* were committed to writing by Richard James, an Oxford graduate who was in Russia about that time as chaplain of the embassy. The most pathetic of these is that relating to the unfortunate Xenia, the daughter of Boris Godunoff. Yermak, the conqueror of Siberia, forms the subject of a very spirited lay, and there is another on the death of Ivan the Terrible. Considering the relation in which she stood to the Russians, we cannot wonder that Marina, the wife of the false Demetrius, appears as a magician. Many spirited poems are consecrated to the achievements of Stenka Razia, the bold robber of the Volga, who was a long time a popular hero. The cycle of Peter the Great is a very interesting one. We have songs in abundance on the various achievements of the wonderful czar, as the taking of Azoff in 1696. There is also a poem on the execution of the streltzi, and another on the death of Peter. In the more modern period there are many songs on Napoleon. The Cossack songs, written in the Little Russian language, dwell upon the glories of the *sech*, the sufferings of the people from the invasions of the Turks and Mongols, the exploits of the Haidamaks and lastly the

fall of the Cossack republic. Besides these, the Russians can boast of large collections of religious poems, many of them containing very curious legends. In them we have a complete store of the beliefs of the Middle Ages. A rich field may be found here for the study of comparative mythology and folk-lore. Many of them are of considerable antiquity, and some seem to have been derived from the Midrash. Some of the more important of these have been collected by Beszonoff. Besides the *bilini* or legendary poems, the Russians have large collections of *skazki* or folk-tales, which have been gathered together by Sakharoff, Afanasieff, and others. They also are full of valuable materials for the study of comparative mythology.

Leaving the popular and oral literature, we come to Earliest what has been committed to writing. The earliest written specimen of Russian, properly so-called, must be considered literature the Ostromir Codex, written by the *diak* Gregory at the order of Ostromir, the *posadnik* or governor of Novgorod. This is a Russian recension of the Slavonic Gospels, of the date 1056–57. Of the year 1073 we have the *Izbornik* or “Miscellany” of Sviatoslaff. It was written by John the diak or deacon for that prince, and is a kind of Russian encyclopædia, drawn from Greek sources. The date is 1076. The style is praised by Buslaeff as clear and simple. The next monument of the language is the *Discourse concerning the Old and New Testament* by Ilarion, metropolitan of Kieff. In this work there is a panegyric on Prince Vladimir of Kieff, the hero of so much of the Russian popular poetry. Other writers are Theodosius, a monk of the Pestcherski cloister, who wrote on the Latin faith and some *Pouchenia* or “Instructions,” and Luke Zhidiata, bishop of Novgorod, who has left us a curious *Discourse to the Brethren*. From the writings of Theodosius we see that many pagan habits were still in vogue among the people. He finds fault with them for allowing these to continue, and also for their drunkenness; nor do the monks escape his censures. Zhidiata writes in a more vernacular style than many of his contemporaries; he eschews the declamatory tone of the Byzantine authors.

With the so-called *Chronicle of Nestor* (*q.v.*) begins the long series of the Russian annalists. There is a regular catena of these chronicles, extending with only two breaks to the time of Alexis Mikhailovich, the father of Peter the Great. Besides the work attributed to Nestor, we have chronicles of Novgorod, Kieff, Volhynia, and many others. Every town of any importance could boast of its annalists, Pskoff and Suzdal among others. In some respects these compilations, the productions of monks in their cloisters, remind us of the *Anglo-Saxon Chronicle*, dry details alternating with here and there a picturesque incident; but the *Anglo-Saxon Chronicle* has nothing of the saga about it, and many of these annals abound with the quaintest stories. There are also works of early travellers, as the igumen Daniel, who visited the Holy Land at the end of the 11th and beginning of the 12th century. A later traveller was Athanasius Nikitin, a merchant of Tver, who visited India in 1470. He has left a record of his adventures, which has been translated into English and published for the Hakluyt Society. Later also is the account written by the two merchants, Korobeinikoff and Grekoff. They were sent with a sum of money to the Holy Sepulchre to entreat the monks to pray without ceasing for the soul of the son of Ivan the Terrible, whom his father had killed. A curious monument of old Slavonic times is the *Pouchenie* (“Instruction”) written by Vladimir Monomakh for the benefit of his sons. This composition is generally found inserted in the *Chronicle of Nestor*; it gives a quaint picture of the daily life of a Slavonic prince.

In the 12th century we have the sermons of Cyril, the Religious bishop of Turoff, which are attempts to imitate in Russian literature.

the florid Byzantine style. He is very fond of allegorical representations; thus, in his sermon on Holy Week, Christianity is represented under the form of spring, Paganism and Judaism under that of winter, and evil thoughts are spoken of as boisterous winds. An attempt to carry this symbolism through other portions of his writings leads him to many fantastic conceits which are far from being in good taste. And here may be mentioned the many lives of the saints and the Fathers to be found in early Russian literature. Some of these have been edited by Count Bezborodko in his *Pamietniki Starinnoi Russkoi Literaturi* ("Memorials of Ancient Russian Literature").

The Story of Igor. We now come to the story of the expedition of Prince Igor, which is a kind of *bilina* in prose, and narrates the expedition of Igor, prince of Novgorod-Severski, against the Polovtzes. The manuscript was at one time preserved in a monastery at Yaroslavl, but was burnt in the great fire at Moscow in the year 1812. Luckily the story had been edited (after a fashion) by Count Musin-Pushkin, and a transcript was also found among the papers of the empress Catherine. The authenticity of this production has been disputed by some modern scholars, but without solid grounds. The original was seen by several men of letters in Russia, Karamzin among the number. There is a mixture of Christian and heathen allusions, but there are parallels to this style of writing in such a piece as the "Discourse of a Lover of Christ and Advocate of the True Faith," from which an extract has been given by Buslaeff in his *Chrestomathy*. Unlike most of the productions of this period, which are tedious, and interesting only to the philologist and antiquary, there is a great deal of poetical spirit in the story of Igor, and the metaphors are frequently very vigorous. Mention is made in it of another bard named Boyan, but none of his inspirations have come down to us. A strange legend is that of the czar Solomon and Kitovras, but the story occurs in the popular literatures of many countries. Some similar productions among the Russians are merely adaptations of old Bulgarian tales, especially the so-called apocryphal writings. The *Zadonstchina* is a sort of prose-poem much in the style of the "Story of Igor," and the resemblance of the latter to this piece and to many other of the *skazania* included in or attached to the Russian chronicle, furnishes an additional proof of its genuineness. The account of the battle of the "Field of Woodcocks," which was gained by Dmitri Donskoi over the Mongols in 1380, has come down in three important versions. The first bears the title "Story of the Fight of the Prince Dmitri Ivanovich with Mamai"; it is rather meagre in details but full of expressions showing the patriotism of the writer. The second version is more complete in its historical details, but still is not without anachronisms. The third is altogether poetical. The *Poviest o Drakule* ("Story of Drakula") is a collection of anecdotes relating to a cruel prince of Moldavia, who lived at the beginning of the 15th century. Several of the barbarities described in it have also been assigned to Ivan the Terrible.

Codes of laws. The early Russian laws present many features of interest, such as the *Russkaia Pravda* of Yaroslaff, which is preserved in the chronicle of Novgorod; the date is between 1018 and 1054. Large additions were made to it by subsequent princes. It has many points in common with the Scandinavian codes, e.g., trial by wager of battle, the wergild, and the circuits of the judges. The laws show Russia at that time to have been in civilization quite on a level with the rest of Europe. But the evil influence of the Mongols was soon to make itself felt. The next important code is the *Sudebnik* of Ivan III., the date of which is 1497; this was followed by that of Ivan IV., of the year 1550, in which we have a republi-

cation by the czar of his grandfather's laws, with additions. In the time of this emperor also was issued the *Stoglav* (1551), a body of ecclesiastical regulations. Mention must also be made of the *Ulozhenie* or "Ordinance" of the czar Alexis. This abounds with enactments of sanguinary punishment: women are buried alive for murdering their husbands; torture is recognized as a means of procuring evidence; and the knout and mutilation are mentioned on almost every page. Some of the penalties are whimsical: for instance, the man who uses tobacco is to have his nose cut off; this, however, was to be altered by Peter the Great, who himself practised the habit and encouraged it in others.

In 1553 a printing press was established at Moscow, and in 1564 the first book was printed, an "Apostol," as it is called, i.e., a book containing the Acts of the Apostles and the Epistles. The printers were Ivan Feodoroff and Peter Mstislavetz; a monument was erected a year or two ago to the memory of the former. As early as 1548 Ivan had invited printers to Russia, but they were detained on their journey. Feodoroff and his companions were soon, however, compelled to leave Russia, and found a protector in Sigismund III. The cause of their failure appears to have been the enmity which they had stirred up among the copyists of books, who felt that their means of gaining a livelihood were lessened. They succeeded accordingly in drawing over to their side the more fanatical priests, who thought it degrading that the sacred books should be multiplied by such an art, just as at the present day the Arabs refuse to allow the Koran to be printed. The first Slavonic Bible was printed at Ostrog in Volhynia in 1581. Another press, however, was soon established at Moscow; up to 1600 sixteen books had been issued there.

A curious work of the time of Ivan the Terrible is the *Domostroi*, or "Book of Household Management," which is said to have been written by the monk Sylvester, although this statement has been disputed. This priest was at one time very influential with Ivan, but ultimately offended him and was banished to the Solovetzkoi monastery on the White Sea. The work was originally intended by Sylvester for his son Anthemius and his daughter-in-law Pelagia, but it soon became very popular and in general use. We have a faithful picture of the Russia of the time, with all its barbarisms and ignorance. We see the unbounded authority of the husband in his own household: he may inflict personal chastisement upon his wife; and her chief duty lies in ministering to his wants. The Mongols had introduced into Russia the Oriental seclusion of women; those of the older time knew nothing of these restrictions. Sylvester, or whoever wrote the book, was a complete conservative, as indeed the clergy of Russia almost universally were.¹ To the reign of Ivan the Terrible must also be assigned the *Chetii-Minei* or "Book of Monthly Readings," containing extracts from the Greek fathers, arranged for every day of the week. The work was compiled by the metropolitan Macarius, and was the labour of twelve years. An important writer of the same period was Prince Andrew Kurbski, descended from the sovereigns of Yaroslavl, who was born about 1528. In his early days Kurbski saw a great deal of service, having fought at Kazan and in Livonia. But he quarrelled with Ivan, who had begun to persecute the followers of Sylvester and Adasheff, and fled to Lithuania in 1563, where he was well received by

¹ In a curious letter of the date of 1698, and now among the manuscripts of the Bodleian, Bishop Burnet writes thus of a priest who accompanied Peter the Great to England: "The czar's priest is come over, who is a truly holy man, and more learned than I should have imagined, but thinks it a great piece of religion to be no wiser than his fathers, and therefore cannot bear the thought of imagining that anything among them can want amendment."

17th
century.

Sigismund Augustus. From his retreat he commenced a correspondence with Ivan, in which he reproached him for his many cruelties. Ivan in his answer declared that he was quite justified in taking the lives of his slaves, if he thought it right to do so. While living in Lithuania, Kurbski appeared as the defender of the Greek faith, which was being undermined by the Jesuits. He died in exile in 1583. Kurbski was a fluent writer, but Bestuzheff Riumin thinks that his hatred of Ivan led him to exaggerate, and he regrets that Karamzin should have followed him so closely. Besides the answers of Ivan to Kurbski, there is his letter to Cosmas, and the brotherhood of the Cyrillian monastery on the White Lake (Bielo Ozero), in which he reproaches them for the self-indulgent lives they are leading. Other works of the 16th century are the *Stepennaya Kniga*, or "Book of Degrees" ("or Pedigrees"), in which historical events are grouped under the reigns of the grand-dukes, whose pedigrees are also given; and the *Life of the Czar Feodor Ivanovich* (1584-1598), written by the patriarch Job. To the beginning of the 17th century belongs the *Chronograph* of Sergius Kubasoff of Tobolsk. His work extends from the creation of the world to the accession of Michael Romanoff, and contains interesting accounts of such of the members of the Russian royal family as Kubasoff had himself seen. Something of the same kind must have been the journal of Prince Mstislavski, which he showed the English ambassador Jerome Horsey, but which is now lost.¹

Koto-
shikhin.

To the time of the first Romanoffs belongs the story of the siege of Azoff, a prose poem, which tells us, in an inflated style, how in 1637 a body of Cossacks triumphantly repelled the attacks of the Turks. They had seized this town, which they were anxious to hand over to the czar Michael, but circumstances were not ripe for it. There is also an account of the siege of the Troitzza monastery by the Poles during the "Smutnoye Vremya," or Period of Troubles, as it is called,—that which deals with the adventures of the false Demetrius and the Polish invasion which followed. But all these are surpassed by the work on Russia of Gregory Karpoff Kotoshikhin. He served in the ambassador's office (*posolski prikaz*), and when called upon to give information against his colleagues fled to Poland about 1664. Thence he passed into Sweden and wrote his account of Russia at the request of Count Delagardie, the chancellor of that country. He was executed about 1669 for slaying in a quarrel the master of the house in which he lived. The manuscript was found by Prof. Solovieff (not the eminent historian lately deceased) at Upsala and printed in 1840. A new edition has recently appeared, and Prof. Grote has collected some fresh facts about the author's life, but we have no space here for a minute examination of them. The picture which Kotoshikhin draws of his native country is a sad one: ignorance, cruelty, and superstition are seen everywhere rampant. His work is of great importance, since it is from his description, and the facts we gather from the *Domostroi*, that we can reconstruct the Old Russia of the time before Peter the Great, as in our days the valuable labours of M. Zabielin have done in his work on Russian domestic life. Perhaps, as an exile from his country, Kotoshikhin has allowed himself to write too bitterly. A curious work is the *Uriadnik Sokol-nichia Puti* ("Directions for Falconry"), which was written for the use of the emperor Alexis, who, like many Russians

of old time, was much addicted to this pastime. The Serb, Yuri Krizhanich, who wrote in Russian, was the first Pan-Krizhanich. He wrote a critical Servian grammar (with comparison of the Russian, Polish, Croatian, and White Russian), which was edited from the manuscripts by Bodianski in 1848. For his time he had a very good insight into Slavonic philology. His Panslavism, however, sometimes took a form by no means practical. He went so far as to maintain that a common Slavonic language might be made for all the peoples of that race,—an impossible project which has been the dream of many enthusiasts. From some unexplained cause he was banished to Siberia, and finished his grammar at Tobolsk. He also wrote a work on the Russian empire, which was edited by Beszonoff in 1860. In it he shows himself a widely-read man, and with very extensive Western culture. The picture drawn, as in the corresponding production of Kotoshikhin, is a very gloomy one. The great remedy suggested by the Serb is education. To this period belongs the life of the patriarch Nikon by Shusherin. The struggles of Nikon with the czar, and his emendations of the sacred books, which led to a great schism in Russia, are well known. They have been made familiar to Englishmen by the eloquent pages of Dean Stanley.² At Moscow may be seen the portrait of this celebrated divine and his tomb; his robes, which have been preserved, show him to have been a man of 7 feet in stature. The mistakes which had crept into the translation of the Scriptures, from the blunders of generations of copyists, were frequently of a ludicrous character; still, a large number of the people preferred retaining them, and from this revision may be dated the rise of the Raskolniks (Dissenters) or Staro-obriadtzi (those who adhere to the old ritual). With the name of Simeon Polotzki, Polotzki (1628-1680) the old period of Russian literature may be closed. He was tutor to the czar Feodor, son of Alexis, and may be said in a way to have helped to introduce the culture of the West into Russia, as he was educated at Kieff, then a portion of Polish territory. Polotzki came to Moscow about 1664. He wrote religious works (*Vienetz Vierť*, "The Garland of Faith,") and composed poems and religious dramas (*The Prodigal Son*, *Nebuchadnezzar*, &c.). He has left us some droll verses on the czar's new palace of Kolomenskoe, which are very curious doggerel. The artificial lions that roared, moved their eyes, and walked especially delighted him. Alexis had probably ordered something to be constructed resembling the machinery we find mentioned in the Byzantine writers. There does not seem to be any ground for the assertion (often met with even in Russian writers) that Sophia, the sister of Peter the Great, was acquainted with French, and translated some of the plays of Molière.

And now all things were to be changed as if by an The enchanter's wand. Russia was to leave her martyrologies and historical stories and fragmentary chronicles, and to adopt the forms of literature in use in the West. One of the chief helpers of Peter the Great in the education of the people was Feofane (Theophanes) Procopovich, who advocated the cause of science, and attacked unsparingly the superstitions then prevalent; the cause of conservatism was defended by Stephen Yavorski. The *Rock of Faith* of the latter was written to refute the Lutherans and Calvinists. Another remarkable writer of the times of Peter the Great was Pososhkoff, who produced a valuable work on *Poverty and Riches*, a kind of treatise on political economy. Antiokh Kantemir (1708-1744), son of a former hospodar of Moldavia, wrote some clever satires still read; they are imitated from Boileau. He also

¹ Horsey says: "I read in their cronicells written and kept in secrete by a great priem prince of that country named Knez Ivan Fedorowich Mistisloskote, who, owt of his love and favour, imparted unto me many secrets observed in the memory and procis of his tyme, which was fowenscore years, of the state, natur, and government of that comonweelth."—Bond, *Russia at the Close of the Sixteenth Century* (Hakluyt Society), 1856.

² *Lectures on the Eastern Church.*

- translated parts of Horace. Besides his satires, he published versions of Fontenelle's *Pluralité des Mondes* and the histories of Justin and Cornelius Nepos. He was for some time Russian ambassador at the courts of London and Paris. But more celebrated than these men was MICHAEL LOMONOSOFF (*q.v.*). He was an indefatigable writer of verse and prose, and has left odes, tragedies, didactic poetry, essays, and fragments of epics; without being a man of great genius he did much to advance the education of his country. He also made many valuable contributions to science. Basil Tatistcheff (1686-1750), a statesman of eminence, was the author of a Russian history which, although written in a confused style and hardly superior to a chronicle, is interesting as the first attempt in that field, which was afterwards so successfully cultivated by Karamzin, Solovieff, and Kostomarov. His work was not given to the world till after his death. There had been a slight sketch published before by Khilkoff, entitled the *Marrow of Russian History*. Basil Trediakovski (1703-1769) was but a poor poetaster, in spite of his many productions. He was born at Astrakhan, and we are told that Peter, passing through that city at the time of his Persian expedition, had Trediakovski pointed out to him as one of the most promising boys of the school there. Whereupon, having questioned him, the czar said, with truly prophetic insight, "A busy worker, but master of nothing." His *Telemakhida*, a poem in which he versified the *Télémaque* of Fénelon, drew upon him the derision of the wits of the time. He had frequently to endure the rough horse-play of the courtiers, for the position of a literary man at that time in Russia was not altogether a cheerful one.
- From the commencement of the reign of Elizabeth Russian literature made great progress, the French furnishing models. Alexander Sumarokoff (1718-1777) wrote prose and verse in abundance—comedies, tragedies, idyls, satires, and epigrams. He is, perhaps, best entitled to remembrance for his plays, which are rhymed, and in the French style. It took the Russians some time to find out that their language was capable of the unrhymed iambic line, which is the most suitable for tragedy. His *Dmitri Samozvanetz* ("Demetrius the Pretender") is certainly not without merit. Some of the pieces of Kniazhnin had great success in their time, such as *The Chatterbox*, *The Originals*, and especially *The Fatal Carriage*. He is now, however, almost forgotten. In 1756 the first theatre was opened at St Petersburg, the director being Sumarokoff. Up to this time the Russians had acted only religious plays, such as those written by Simeon Polotzki. The reign of Catherine II. (1762-96) saw the rise of a whole generation of court poets, many of whom were at best but poor writers. Everything in Russia was to be forced like plants in a hot-house; she was to have Homers, Pindars, Horaces, and Virgils. Michael Kheraskoff (1733-1807) wrote besides other poems two enormous epics—the *Rossiada* in twelve books, and *Vladimir* in eighteen; they are now but little read. Although they are tedious poems on the whole, yet we occasionally find spirited passages. Bogdanovich (1743-1803) wrote a pretty lyric piece, *Dushenka*, based upon La Fontaine, and telling the old story of the loves of Cupid and Psyche. Perhaps the elegance of the versification is the best thing to be found in it. With Ivan Khemnitz begins the long list of fabulists; this half-Oriental form of literature, so common in countries ruled absolutely, has been very popular in Russia. Khemnitz (1744-1784), whose name seems to imply a German origin, began by translating the fables of Gellert, but afterwards produced original specimens of this kind of literature. A writer of real national comedy appeared in Denis von Visin, probably of German extraction, but born at Moscow (1745-1792). His best production is *Nedorosl* ("The Minor"), in which he satirizes the coarse features of Russian society, the ill-treatment of the serfs, and other matters. The colouring of the piece is truly national. He has also left some very good letters describing his travels. He saw France on the eve of the great Revolution, and has well described what he did see. Russian as he was, and accustomed to serfdom, he was yet astonished at the wretched condition of the French peasants. The great poet of the age of Catherine, the laureate of her glories, was Gabriel Derzhavin (1743-1816). He essayed many styles of composition, and was a great master of his native language. Many of his lyric pieces are full of fire. No one can deny the poet a vigorous imagination and a great power of expressing his ideas. There is something grandiose and organ-like in his high-sounding verses; unfortunately he occasionally degenerates into bombast. His versification is perfect; and he had the courage, rare at the time, to write satirically of many persons of high rank. His *Ode to God* is the best known of his poems in Western countries. We can see from some of his pieces that he was a student of Edward Young, the author of the *Night Thoughts*. Tawdry rhetoric, containing, however, occasionally fine and original thoughts, rendered this writer popular throughout Europe. Other celebrated poems of Derzhavin are the *Odes on the Death of Prince Mestcherski*, *The Nobleman*, *The Taking of Ismail*, and *The Taking of Warsaw*.
- An unfortunate author of the days of Catherine was Radis-Alexander Radistcheff, who, having, in a small work, *A tcheff. Journey to Moscow*, spoken too severely of the miserable condition of the serfs, was punished by banishment to Siberia, from which he was afterwards allowed to return, but not till his health had been permanently injured by his sufferings. An equally sad fate befell the spirited writer Novikoff, who, after having worked hard as a Novikoff. journalist, and done much for education in Russia, fell under the suspicion of the Government, and was imprisoned by Catherine. On her death he was released by her successor. The short reign of Paul was not favourable to literary production; the censorship of the press was extremely severe, and many foreign books were excluded from Russia. Authors and lovers of literature were liable to get into trouble, as we see by the experiences of the poet Kotzebue and pastor Seidler.
- But a better state of things came with the reign of Alexander, one of the glories of whose days was NICHOLAS Karamzin (*q.v.*). His chief work is his *History of the Russian Empire*, but he appeared in the fourfold aspect of historian, novelist, essayist, and poet. Nor need we do more than mention the celebrated Archbishop PLATON Platon (*q.v.*). Ivan Dmitrieff (1760-1837) wrote some pleasing Dmitrieff. lyrics and epistles, but without much force. He is like some feeble British poets towards the close of last century, in whom the elegance of the diction will not atone for the feebleness of the ideas. He appears from his translations to have been well acquainted with the English poets. Ozeroff wrote a great many tragedies, which are Ozeroff. but little read now. They are in rhyming alexandrines. His form belongs to the false classical school, but he occasionally handled native subjects with success, as in his *Dmitri Donskoi* and *Yaropolk and Oleg*. In Ivan Kriloff. Kriloff (1768-1844) the Russians found their most genial fabulist. His pieces abound with vigorous pictures of Russian national life, and many of his lines are standard quotations with the Russians, just as *Hudibras* is with ourselves. Long before his death Kriloff had become the most popular man in Russia. He resembled La Fontaine not only in the style of his verse but in his manner of life. He was the same careless, unpractical sort of person, and

showed the same simplicity of character. As Derzhavin was the poet of the age of Catherine, so Zhukovski (1783-1852) may be said to have been that of the age of Alexander. He is more remarkable, however, as a translator than as an original poet. With him Romanticism began in Russia. The pseudo-classical school, led by the French, was now dead throughout Europe. In 1802 he published his version of Gray's *Elegy*, which at once became a highly popular poem in Russia. Zhukovski translated many pieces from the German (Goethe, Schiller, Uhland) and English (Byron, Moore, Southey). One of his original productions, "The Poet in the Camp of the Russian Warriors," was on the lips of every one at the time of the war of the fatherland (*Otechestvennaia Voyna*) in 1812. He attempted to familiarize the Russians with all the most striking specimens of foreign poetical literature. He produced versions of the episode of Nala and Damayanti from the *Mahabharata*, of Rustam and Zohrab from the *Shah-Namah*, and of a part of the *Odyssey*. In the case of these three masterpieces, however, he was obliged to work from literal translations (mostly German), as he was unacquainted with the original languages. The *Iliad* was translated during this period by Gnedich, who was familiar with Greek. He has produced a faithful and spirited version, and has naturalized the hexameter in the Russian language with much skill. Constantine Batiushkoff (1787-1855) was the author of many elegant poems, and at the outset of his career promised much, but sank into imbecility, and lived in this condition to an advanced age. Merzliakoff and Tziganoff deserve a passing notice as the writers of songs some of which still keep their popularity. As the poet of the age of Catherine was Derzhavin, and of that of Alexander Zhukovski, so the next reign, that of Nicholas, was to have its representative poet, by the common consent of his critics the greatest whom Russia had yet seen. During his short life (1799-1837) Alexander Pushkin produced many celebrated poems, which will be found enumerated in the article devoted to him (see PUSHKIN). It may suffice to say here that he tried almost all styles of composition—the drama, lyric poetry, the novel, and many others. In Alexander Griboiedoff (1794-1829) the Russians saw the writer of one of their most clever comedies (*Gore ot Uma*), which may perhaps be translated "The Misfortune of being too Clever" (lit. "Grief out of Wit"). The fate of Griboiedoff was sad; he was murdered in a riot at Teheran, where he was residing as Russian minister at the court of Persia. The poet is said to have had a presentiment of his fate and to have been unwilling to go. Pushkin, while travelling in the Caucasus, in the track of the army of Paskewitch, met the body of his friend, which was being carried to Tiflis for burial. The satirical powers of Griboiedoff come out in every line of his play; he was unquestionably a man of genius. A few words may be allowed to Ivan Kozloff (1774-1838), the author of some pretty original lyrics, and some translations from the English, among others Burns's *Cotter's Saturday Night*. He became a cripple and blind, and his misfortunes elicited some cheering and sympathetic lines from Pushkin, which will always be read with pleasure.

Since the death of Pushkin, the most eminent Russian poet is Lermontoff (1814-41); his life terminated, like that of his predecessor, in a duel. He has left us many exquisite lyrics, mostly written in a morbid and melancholy spirit. In quite a different vein is his clever imitation of a Russian bilina, "Song about the Czar Ivan Vasilievich, the Young Oprichnik, and the Bold Merchant Kalashnikoff." The poet was of Scotch extraction (Learmont), the termination being added to Russify his name. In one of his pieces he has alluded to his

Caledonian ancestors. His chief poems are "The Demon," "The Novice" ("Mtziiri," a Georgian word), and "Hadji Abrek." He also wrote a novel, *A Hero of our Time*. He has faithfully reproduced in his poems the wild and varied scenery of the Caucasus and Georgia; from them he has drawn his inspiration—feeling, no doubt, that the flat grey landscapes of northern Russia offered no attractions to the poet. A genuine bard of the people, and one of their most truly national authors, was Koltzoff (1809-1842), the son of a tallow merchant of Voronezh. He has left us a few exquisite lyrics, which are to be found in all the collections of Russian poetry. He died of consumption after a protracted illness. Another poet who much resembled Koltzoff was Nikitin, born in the same town, Voronezh. His life was spent in poverty; his father was an incurable drunkard, and brought his family to the greatest distress. Nikitin, to support his relations, was obliged to keep an inn; this he was afterwards enabled to change for the more congenial occupation of a bookseller. He died in 1861. The novel in Russia has had its cultivators in Zagoskin and Lazhechnikoff, who imitated Sir Walter Scott. The most celebrated of the romances of Zagoskin was *Yuri Miloslavski*, a tale of the expulsion of the Poles from Russia in 1612. The book may even yet be read with interest; it gives a very spirited picture of the times; unfortunately, as is but too often the case with the writings of Sir Walter Scott himself, a gloss is put upon the barbarity of the manners of the period, and the persons of the novel have sentiments and modes of expressing them which could only have existed about two centuries afterwards. There is also too much of the sentimentalism which was prevalent at the time when the author wrote. Among the better known productions of Lazhechnikoff are *The Heretic* and *The Palace of Ice*. A flashy but now forgotten writer of novels was Bulgarin, author of *Ivan Vishigin*, a work which once enjoyed considerable popularity. The first Russian novelist of great and original talent was Nicholas Gogol (1809-1852). In his *Dead Souls* he satirized all classes of society, some of the portraits being wonderfully vivid; take, for example, that of Plushkin, the miser. Being a native of Little Russia, he is very fond of introducing descriptions of its scenery and the habits of the people, especially in such stories as the *Old-fashioned Household*, or in the more powerful *Taras Bulba*. This last is a highly-wrought story, giving us a picture of the savage warfare carried on between the Cossacks and Poles. Taras is brave, but perhaps too much of a barbarian to be made interesting to Western readers. He reminds us of some of the heroes of the Cossack poet Shevchenko. Gogol was also the author of a good comedy, *The Reviser*, wherein the petty pilferings of Russian municipal authorities are satirized. In his *Memoirs of a Madman* and *Portrait*, he shows a weird and fantastic power which proves him to have been a man of strong imagination. The same may be said of *The Cloak*, and the curious tale *Vii* ("The Demon"), where he gives us a picture of Kieff in the old days. He has very dexterously interwoven his tales with the traditions and superstitions of Little Russia. The fate of Gogol was sad; he sank into religious melancholy, and ultimately into imbecility. He made great efforts to destroy all his writings, and indeed burnt most of the second part of his *Dead Souls*; only fragments have been preserved. His *Confessions of an Author* is the production of a mind verging on insanity. He died in 1852, aged forty-two. Since his time the novel has been very much cultivated in Russia, the school culminating in Ivan Turgenieff, but it is the school of Thackeray and Dickens, not that of Balzac and George Sand. The Russians seem to affect especially the realistic

Herzen. novels of England. Among the most conspicuous of these writers was the celebrated Alexander Herzen, author of a striking romance, *Kto Vinovat?* ("Who is to Blame?"), which he published under the assumed name of Iskander. The public career of Herzen is well known. The freedom of his opinions soon embroiled him with the authorities. He was exiled to Perm, and, seizing the first opportunity which offered itself of passing the Russian frontiers, he spent the remainder of his life chiefly in France and England, and died at Geneva in 1869. His celebrated journal *Kolokol* ("The Bell") had a great circulation. A novelist of repute was Goncharoff, his two chief works being *A Common-place Story* and *Oblomoff*. Grigorovich has written *The Fisherman* and *The Emigrants*. Pisemski, another novelist of the realistic type, is the author of *The Man of St Petersburg* and *Lieshî* ("The Wood Demons"). Other novelists of celebrity are Saltikoff, who writes under the name of Stchedrin, and whose *Provincial Sketches* published a few years ago made a great sensation and have been followed by *Letters to My Aunt* and other works; Dostoevski (d. 1881), author of *Poor People*, *Letters from the House of the Dead* (describing his impressions of Siberia, whither he was banished in consequence of a political offence), a powerful writer; and Ostrovski. We may also add Ryeshetnikoff, who takes his characters from the humbler classes; he died at the early age of thirty-nine. All these are disciples of the school of Dickens and Thackeray. Count A. Tolstoi, also celebrated as a dramatist, has written an historical novel entitled *Prince Serebrianni*. Count L. Tolstoi is author of a work of fiction describing the war of 1812, which has gained great celebrity in Russia, *Voïna i Mir* ("War and Peace"). Novelists of the French school are Krestovski, Stebnitzki, and Boborikin. During 1885 a new writer of merit, Kozolenko, appeared, who describes Siberian life.

Turgen-
ieff. On September 4, 1883, died Ivan Turgenieff, aged sixty-four, the most eminent Russian novelist, and perhaps the only Russian man of letters universally known. His celebrity dates from his *Memoirs of a Sportsman*, in which he appears as the advocate of the Russian *muzhik* or peasant. He had witnessed in his youth many sad scenes at his own home, where his mother, a wealthy lady of the old school, treated her serfs with great cruelty. The poet devoted all his energies to procure their emancipation. This work was followed by a long array of tales, too well known to need recapitulation here, which have gained their author a European reputation, such as *Dvorianskoe Gnezdo* ("A Nest of Gentle People"), one of the most pathetic tales in any language, *Nov* ("Virgin Soil"), and others; nor can the minor tales of Turgenieff be forgotten, especially *Mumu*, a story based upon real life, for the dumb door-keeper was a serf of his mother's, and experienced her ill-treatment. His last two works were *Poetry in Prose* and *Clara Milich*.

Belinski. In Belinski the Russians produced their best critic. For thirteen years (1834-1847) he was the Aristarchus of Russian literature and exercised a healthy influence. In his latter days he addressed a withering epistle to Gogol on the newly-adopted reactionary views of the latter.

His-
torians.
Polevoi. Since the time of Karamzin the study of Russian history has made great strides. He was followed by Nicholas Polevoi, who wrote what he called the *History of the Russian People*, but his work was not received with much favour and has now fallen into oblivion. Polevoi was a self-educated man, the son of a Siberian merchant; besides editing a well-known Russian journal *The Telegraph*, he was also the author of many plays, among others a translation of *Hamlet*. Since his time, however, the English dramatist has been produced in a more

perfect dress by Kroneberg, Druzhinin, and others. In the year 1879 died Sergius Solovieff, whose *History of Solovieff. Russia* had reached its twenty-eighth volume, and fragments of the twenty-ninth were published after his death. This stupendous labour lacks something of the critical faculty, and perhaps may be described rather as a quarry of materials for future historians of Russia than an actual history. During 1885 the Russians have had to mourn the loss of Kostomarov, the writer of many valuable monographs on the history of their country, of which those on Bogdan Khmelnitzki and the False Demetrius deserve special mention. From 1847 to 1854 Kostomarov, who had become obnoxious to the Russian Government, wrote nothing, having been banished to Saratoff, and forbidden to teach or publish. But after this time his literary activity begins again, and, besides separate works, the leading Russian reviews, such as *Old and New Russia*, *The Historical Messenger*, and *The Messenger of Europe*, contain many contributions from his pen of the highest value. In 1885 also died Constantine Kavelin, the author of many valuable works on Russian law, and Kalatcheff, who published a classical edition of the old Russian codes. Ilvaiski and Gedeonoff have attempted to upset the general belief that the founders of the Russian empire were Scandinavians. Their opinions have been alluded to above (p. 87). A good history of Russia was published by Ustrialoff (1855), but his most celebrated work was his *Tzarsitvovanie Petra Velikago* ("Reign of Peter the Great"); in this many important documents first saw the light, and the circumstances of the death of the unfortunate Alexis were made clear. Russian writers of history have not generally occupied themselves with any other subject than that of their own country, but an exception may be found in the writings of Granovski, such as *Abbé Suger* (1849) and *Four Historical Portraits* (1850). So also Kudriavtsoff, who died in 1850, wrote on "The Fortunes of Italy, from the Fall of the Roman Empire of the West till its Reconstruction by Charlemagne." He also wrote on "The Roman Women as described by Tacitus." We may add Kareyeff, now professor at Warsaw, who has written on the condition of the French peasantry before the Revolution. Other writers on Russian history have been Pogodine, who compiled a *History of Russia till the invasion of the Mongols*, 1871, and especially Zabelin, who has written a *History of Russian Life from the most Remote Times* (1876), and the *Private Lives of the Czarinas and Czars* (1869 and 1872). Leshkoff has written a *History of Russian Law to the 18th Century*, and Tchitcherin a *History of Provincial Institutions in Russia in the 17th Century* (1856). To these must be added the work of Zagoskin, *History of Law in the State of Muscovy* (Kazan, 1877). Prof. Michael Kovalevski, of the university of Moscow, is now publishing an excellent work on *Communal Land Tenure*, in which he investigates the remains of this custom throughout the world. Of the valuable history of Russia by Prof. Bestuzheff-Riumin (1872) one volume only has appeared; the introductory chapters giving an account of the sources and authorities of Russian history are of the highest value. It is the most critical history of Russia which has yet appeared. In 1885 Dubrovin published an excellent history of the revolt of Pugatcheff. The valuable work by Messrs Pipin and Spasovich, *History of Slavonic Literatures*, is the most complete account of the subject, and has been made more generally accessible to Western students by the German translation of Pech. The *History of Slavonic Literature* by Schafarik, published in 1826, has long been antiquated. Previous to this, a history of Russian literature by Paul Polevoi had appeared, which has gone through two editions. It is modelled upon Chambers's *Cyclopædia of English Literature*. The account of

the Polish rebellion of 1863 by Berg, published in 1873, which gave many startling and picturesque episodes of this celebrated struggle, has now been withdrawn from circulation. It appeared originally in the pages of the Russian magazine, *Starina*.

Recent poets.

Since the death of Lermontoff the chief Russian poet who has appeared is Nicholas Nekrasoff, who died in 1877. He has left six volumes of poetry, which in many respects remind us of the writings of Crabbe; the poet dwells mainly upon the melancholy features of Russian life. He is of that realistic school in which Russian authors so much resemble English. Another writer of poetry deserving mention is Ogariëff, for a long time the companion in exile of Herzen in England; many of his compositions appeared in the *Polar Star* of the latter, a medley of prose and verse, which contains some very important papers, including the interesting autobiographical sketches of Herzen, entitled *Biloe i Dumt* ("The Past and my Thoughts"). Maikoff at one time enjoyed great popularity as a poet; he is a kind of link between the present generation and that of Pushkin, of whose elegance of versification he is somewhat of an imitator. Another poet of a past generation was Prince Viazemski, whose works are now being collected. Graceful lyrics have also been written by Mei, Fet (whose name would apparently prove Dutch extraction, Veth), Stcherbina, and, going a little farther back, Yazikoff, the friend of Pushkin, and Khomiakoff, celebrated for his Slavophile propensities. To these may be added Mdle Zhadovskaia, who died a short time ago, Benediktoff, Podolinski, and Tiutcheff. It will be seen that in Russia (as in England) lyrical poetry is almost the only form now cultivated. It is becoming more and more coloured with imitations of the *bilini* and reproductions of the old Russian past, which is perhaps getting treated somewhat fantastically, as was the old Irish life in the Irish melodies of Moore. Occasionally Polonski contributes one of his exquisite lyrics to the *Viestnik Yevrope* ("European Messenger").

Philologists.

Excellent works on subjects connected with Slavonic philology have been published by Vostokoff, who edited the Ostromir Codex, mentioned above (p. 103), and Sreznevski and Bodianski, who put forth an edition of the celebrated codex used at Rheims for the coronation of the French kings. Since their deaths their work has been carried on by Prof. Grote (*Philological Investigations*, also many critical editions of Russian classics). Budilovich, now a professor at Warsaw, Potebnya of Kharkoff, and Baudoin de Courtenay, who, among other services to philology, has described the Slavonic dialect spoken by the Resanians, a tribe living in Italy, in two villages of the Julian Alps. The songs (*bilini*) of the Russians have been collected by Zakrevski, Rîbnikoff, Hilferding, Barsoff, and others, and their national tales by Sakharoff, Afanasieff, and Erlenwein. Kotliarevski, Tereshenko, and others have treated of their customs and superstitions, but it is to be regretted that no one as yet has made a complete study of the vexed question of Slavonic mythology. At the present time Stanislaus Mikutzki, professor at the university of Warsaw, is publishing his *Materials for a Dictionary of the Roots of the Russian and all Slavonic Dialects*, but, unfortunately, it represents a somewhat obsolete school of philology. The Early Russian Text Society continues its useful labours, and has edited many interesting monuments of the older Slavonic literature. Quite recently two valuable codices have been printed in Russia, Zographus and Marianus, interesting versions of the Gospels in Palæoslavonic. They were edited by the learned Croat Jagić, who now occupies the chair of Sreznevski in St Petersburg. An excellent *Tolkovi Slovar Velikorusskago Yazika* ("Explanatory Dictionary of the Great Russian

Language"), by Dahl, has gone into a second edition. Alexander Hilferding published some valuable works on ethnology and philology, among others on the Polabes, an extinct Slavonic tribe who once dwelt on the banks of the Elbe. Although they have produced some good Slavonic scholars, the Russians have not exhibited many works in the field of classical or other branches of philology. Exception, however, must be made in favour of the studies of Tchubinoff in Georgian, Minayeff in the Indian, and Tzvetayeff in the old languages of Italy.

In moral and mental philosophy the Russians have produced but few authors. We meet with some good mathematicians, Ostrogradski among others, and in natural science the publications of the Society for Natural History at Moscow have attracted considerable attention.

Since the *Boris Godunoff* of Pushkin, which was the first attempt in Russia to produce a play on the Shakespearean model, many others have appeared in the same style. A fine trilogy was composed by Count A. Tolstoi on the three subjects, *The Death of Ivan the Terrible* (1866), *The Czar Feodor* (1868), and *The Czar Boris* (1869). Other plays of merit have been written by Ostrovski and Potiekhin.

Many excellent literary journals and magazines make their appearance in the country; among these may especially be mentioned the time-honoured *Viestnik Yevrope* ("Messenger of Europe"), which contains some of the most brilliant writing produced in the Russian empire. The *Istoricheski Viestnik* ("Historical Messenger") is full of curious matter, and does not confine itself merely to Russian subjects. It is edited by M. Shubinski, the author of some pleasant sketches on the manners of Russia in the old time. On the contrary *Starina* (the "Antiquary," if we may so freely translate the original name) is entirely Russian, and is a valuable repository of documents concerning the history of the country, and memoirs, especially relating to the latter part of the 17th century. The highly interesting magazine *Drevnaya i Novaya Rossia* did not protract its existence beyond six years, having come to an end in 1881. Many of the best Russian writers contributed to it; it contains much valuable material for the student of history. The *Russkii Arkhiv* is edited by M. Bartenieff, and has long been celebrated; some of the most important notes on Russian history of the 18th and 19th century have appeared in this journal. During the last few years extensive excavations have been made in many parts of Russia, and much has been done to throw light upon the prehistoric period of the country. A large "kurgan," called *Cherna Mogila*, or the Black Grave, was opened by Samokvasoff in the government of Tchernigoff and described in the pages of *Old and New Russia*. Explorations have been carried on on the site of Bolgari, the ancient capital of the Ugrian Bolgars on the Volga. One of the most active workers in this field was the late Count Uvaroff (d. 1884), who published a valuable monograph on the Stone Age in Russia, and many other important works.

A few words must be said on the literature of the Russian Little dialects, the Little and White Russian. The Little Russian is rich in *skazki* (tales) and songs. Peculiar to them is the *duma*, dialect, a narrative poem which corresponds in many particulars with the or Malo-Russian *blina*. Since the commencement of the present century, when curiosity was first aroused on the subject of national poetry, the Little Russian *dumt* have been repeatedly edited, as by Maksimovich Metlinski and others. An elaborate edition (far surpassing the earlier ones) was commenced by Dragomanoff and Antonovich, but as yet only one volume and a portion of a second have made their appearance. Just as the *bilini* of the Great Russians, so also these *dumt* of the Little Russians admit of classification, and they have been divided by their latest editors as follows:—(1) the songs of the *druzhina*, treating of the early princes and their followers; (2) the Cossack period (*Kozachestvo*), in which the Cossacks are found in continual warfare with the

Polish *pans* and the attempts of the Jesuits to introduce the Roman Catholic religion; (3) the period of the Haidamaks, who formed the nucleus of the national party, and prolonged the struggle. The gradual break up of the military republic of these sturdy freebooters has already been described.

The foundation of the Little Russian literature (written, as opposed to the oral) was laid by Ivan Kotliarevski (1769-1838), whose travesty of part of the *Æneid* enjoys great popularity among some of his countrymen. Others, however, object to it as tending to bring the language or dialect into ridicule. A truly national poet appeared in Taras Shevchenko, born at the village of Kirilovka in the government of Kieff, in the condition of a serf. The strange adventures of his early life he has told us in his autobiography. He did not get his freedom till some time after he had reached manhood, when he was purchased from his master by the generous efforts of the poet Zhukovski and others. Besides poetry, he occupied himself with painting with considerable success. He unfortunately became obnoxious to the Government, and was punished with exile to Siberia from 1847 to 1857. He did not long survive his return, dying in 1861, aged forty-six. No one has described with greater vigour than Shevchenko the old days of the Ukraine. In his youth he listened to the village traditions handed down by the priests, and he has faithfully reproduced them. The old times of Nalivaiko, Doroshenko, and others live over again. Like Gogol he is too fond of describing scenes of bloodshed. In the powerful poem entitled *Haidamak* we have a graphic picture of the horrors enacted by Gonta and his followers at Uman. The sketches are almost too realistic. Like Burns with the old Scottish songs, so Shevchenko has reproduced admirably the spirit of the lays of the Ukraine. All those familiar with his works will remember the charming little lyrics with which they are interspersed. The funeral of the poet was a vast public procession; a great cairn, surmounted with a cross, was raised over his remains, where he lies buried near Kaniyoff on the banks of the Dnieper. His grave has been styled the "Mecca of the

South Russian Revolutionists." He is the great national poet of the Southern Russians. A complete edition of his works, with interesting biographical notices—one contributed by the novelist Turgenieff—appeared at Prague in 1876. Besides the national songs, excellent collections of the South Russian folk-tales have appeared, edited by Dragomanoff, Rudchenko, and others. Many of these are still recited by the "tchumaki" or wandering pedlars. A valuable work is the *Zapiski o Yuzhnoi Rossii* ("Papers on Southern Russia"), published at St Petersburg in 1857 by Panteleimon Kulish. After he got into trouble (with Kostomarov and Shevchenko) for his political views, the late works of this author show him to have undergone a complete change. Other writers using the Little Russian language are Marko-Vovchok (that is, Madame Eugenia Markovich), and Yuri Fedkovich, who employs a dialect of Bukovina. Fedkovich, like Shevchenko, sprang from a peasant family, and served as a soldier in the Austrian army against the French during the Italian campaign. Naturally we find his poems filled with descriptions of life in the camp. Like the Croat Preradović, he began writing poetry in the German language, till he was turned into more natural paths by some patriotic friends. A collection of songs of Bukovina was published at Kieff in 1875 by Lona-chevski. At the present time Eugene Zelechowski continues his valuable *Dictionary of Little Russian*, of which about one half has appeared. This promises to be a very useful book, for up to the present time students have been obliged to rest satisfied with the scanty publications of Levchenko, Piskunoff, and Verchratzki. There is a good grammar by Osadtza, a pupil of Miklosich.

In the White Russian dialect are to be found only a few songs, White with the exception of portions of the Scriptures and some legal Russian documents. A valuable dictionary was published a short time ago dialect by Nosovich, but this is one of the most neglected of the Russian dialects, as the part in which it is spoken is one of the dreariest of the empire. Collections of White Russian songs have been published by Shein and others. For details regarding this and the other Russian dialects see SLAVS. (W. R. M.)

RUSTCHUK (Русчук), a city of Bulgaria, Turkey in Europe, on the south bank of the Danube, opposite Giurgevo, at the point where the river receives the waters of the Lom, a fine stream from the northern slopes of the Balkans. Since 1867 it has been connected by rail (139 miles) with Varna. The town was nearly destroyed by the Russian bombardment from Giurgevo in 1877, and the military works have since been dismantled in terms of the treaty of Berlin. Its position on the river frontier of Turkey long made it a place of strategic importance. In 1871 the population was about 23,000 (10,800 Turks, 7700 Bulgarians, 1000 Jews, 800 Armenians, 500 Gipsies,

800 Wallachians and Serbs, 400 Western Europeans), and in 1881 it was returned as 26,163.

In the time of the Romans Rustchuk was one of the fortified points along the line of the Danube. In the *Tabula Peutingeriana* it appears as Prisca, in the *Antonine Itinerary* as Serantaprista, in the *Notitia* as Seragintaprista, and in Ptolemy as Priste Polis. Destroyed by the barbarian invasion, the town recovered its importance only in comparatively modern times. In 1810 it was captured by the Russians, and on his departure next year Kutusoff destroyed the fortifications. In 1828-29 and again in 1858-54 it played a part in the Russo-Turkish War, and in 1877, as already mentioned, it was nearly destroyed.

RUTH, Book of. The story of Ruth, the Moabitess, great-grandmother of David, one of the Old Testament

Hagiographa, is usually reckoned as the second of the five Megilloth or Festal Rolls. This position corresponds to the Jewish practice of reading the book at the Feast of Pentecost; Spanish MSS., however, place Ruth at the head of the Megilloth (see CANTICLES); and the Talmud, in a well-known passage of *Baba Bathra*, gives it the first place among all the Hagiographa. On the other hand the Septuagint, the Vulgate, and the English version make Ruth follow Judges. It has sometimes been held that this was its original place in the Hebrew Bible also, or rather that Ruth was originally reckoned as an appendix to Judges, since it is only by doing this, and also by reckoning Lamentations to Jeremiah, that all the books of the Hebrew canon can be reduced to twenty-two, the number assigned by Josephus and other ancient authorities. But it has been shown in the article LAMENTATIONS (*q.v.*) that the argument for the superior antiquity of this way of reckoning breaks down on closer examination, and, while it was very natural that a later rearrangement should transfer Ruth from the Hagiographa to the historical books, and place it between Judges and Samuel, no motive can be suggested for the opposite change. That the book of Ruth did not originally form part of the series of *Prophetæ priores* (Judges-Kings) is further probable from the fact that it is quite untouched by the process of "prophetic" or "Deuteronomistic" editing, which gave that series its present shape at a time soon after the fall of the kingdom of Judah; the narrative has no affinity with the point of view which looks on the whole history of Israel as a series of examples of divine justice and mercy in the successive rebellions and repentances of the people of God.¹ But if the book had been known at the time when the history from Judges to Kings was edited, it could hardly have been excluded from the collection; the ancestry of David was of greater interest than that of Saul, which is given in 1 Sam. ix. 1, whereas the old history names no ancestor of David beyond his father Jesse. In truth the book of Ruth does not offer itself as a document written soon after the period to which it refers; it presents itself as dealing with times far back (Ruth i. 1), and takes obvious delight in depicting details of antique life and obsolete usages; it views the rude and stormy period before the institution of the kingship through the softening atmosphere of time, which imparts to the scene a gentle sweetness very different from the harsher colours of the old narratives of the book of Judges. In the language, too, there is a good deal that makes for and nothing that makes against a date subsequent to the captivity, and the very designation of a period of Hebrew history as "the days of the judges" is based on the Deuteronomistic additions to the book of Judges (ii. 16 *sq.*) and does not occur till the period of the exile. An inferior limit for the date of the book cannot be assigned with precision. It has been argued that, as the author seems to take no offence at the marriage of Israelites with Moabite women, he must have lived before the time of Ezra and Nehemiah (Ezra ix.; Neh. xiii.); but the same argument would prove that the book of Esther was written before Ezra, and indeed "a disposition to derive prominent Jewish families from proselytes prevailed to a much later date," and finds expression in the Talmud (see Wellhausen-Bleek, p. 205). The language of Ruth, however, though post-classical, does not seem to place it among the very latest Old Testament books, and the manner in which the story is told is as remote from the legal pragmatism of Chronicles as from the prophetic pragmatism of the editor of the older histories. The tone of simple piety and graciousness

which runs through the narrative, unencumbered by the pedantry of Jewish legality, seems to indicate that the book was written before all the living impulses of Jewish literature were choked by the growing influence of the doctors of the law. In this respect it holds in Hebrew prose writing a position analogous to that of the older *Chokma* in Hebrew poetry. But the triumph of the scribes in literature as well as in law was not accomplished till long after the time of Ezra.

Wellhausen in Bleek, 4th edition, p. 204 *sq.*, finds the clearest indication of the date of Ruth in the appended genealogy, Ruth iv. 18-22; compare his remarks in *Probl. Gesch. Israels*, p. 227 (Eng. tr., pp. 217 *sq.*). Salma (Salmon), father of Boaz, is a tribe foreign to old Judah, which was not "father" of Bethlehem till after the exile, and the names of Salma's ancestors are also open to criticism. But this genealogy is also found in Chronicles, and is quite in the manner of other genealogies in the same book. That it was borrowed from Chronicles and added to Ruth by a later hand seems 'certain, for the author of Ruth clearly recognizes that Obed was legally the son of Mahlon, not of Boaz (iv. 5, 10), so that from his standpoint the appended genealogy is all wrong.

The design of the book of Ruth has been much discussed and often in too narrow a spirit; for the author is an artist who takes manifest delight in the touching and graceful details of his picture, and is not simply guided by a design to impart historical information about David's ancestors, or enforce some particular lesson. Now the interest of the story, as a work of art, culminates in the marriage of Boaz and Ruth, not in the fact that their son was David's ancestor, which, if the book originally ended with iv. 17, is only mentioned in a cursory way at the close of the story. Had the author's main design been to illustrate the history of the house of David, as many critics think, or to make the point that the noblest stock in Israel was sprung from an alien mother (Wellhausen), this design would certainly have been brought into more prominence. The marriage acquires an additional interest when we know that Ruth was David's great-grandmother, but the main interest is independent of that, and lies in the happy issue of Ruth and Naomi from their troubles through the loyal performance of the kinsman's part by Boaz. Doubtless the writer meant his story to be an example to his own age, as well as an interesting sketch of the past; but this is effected simply by describing the exemplary conduct of Naomi, Ruth, Boaz, and even Boaz's harvesters. All these act as simple, kindly, God-fearing people ought to act in Israel.

There is one antique custom which the writer follows with peculiar interest and describes with archæological detail as a thing which had evidently gone out of use in his own day. By old Hebrew law, as by the old law of Arabia, a wife who had been brought into her husband's house by contract and payment of a price to her father was not set free by the death of her husband to marry again at will. The right to her hand lay with the nearest heir of the dead. Originally we must suppose, among the Hebrews as among the Arabs, this law was all to the disadvantage of the widow, whose hand was simply part of the dead man's estate; but, while this remained so in Arabia to the time of Mohammed, among the Hebrews the law early took quite an opposite turn; the widow of a man who died childless was held to have a right to have a son begotten on her by the next kinsman, and this son was regarded as the son of the dead and succeeded to his inheritance so that his name might not be cut off from Israel. The duty of raising up a son to the dead lay upon his brother, and in Deut. xxv. 5 is restricted to the case when brothers live together. In old times, as appears from Gen. xxxviii., this was not so, and the law as put in the book of Ruth appears to be that the nearest kinsman of the dead in general had a right to "redeem for himself" the dead man's estate, but at the same time was bound to marry the widow. The son of this marriage was reckoned as the dead man's son and succeeded to his property, so that the "redeemer" had only a temporary usufruct in it. Naomi was too old to be married in this way, but

¹ The religious pragmatism lacking in the original is in part supplied by the Targum (i. 5, 6).

she had certain rights over her husband's estate which the next kinsman had to buy up before he could enter on the property. And this he was willing to do, but he was not willing also to marry Ruth and beget on her a son who would take the name and estate of the dead and leave him out of pocket. He therefore withdraws and Boaz comes in in his place. That this is the sense of the transaction is clear; there is, however, a little obscurity in iv. 5, where one letter seems to have fallen out and we must read *וַיָּבֵן אֶת־רוּת*, and translate "What day thou buyest the field from Naomi thou must also buy Ruth," &c. Comp. vv. 9, 10.

Among older commentaries special mention may be made of J. B. Carpzov, *Collegium rabbinico-biblicum in libellum Ruth*, Lipsic, 1703. In recent times Ruth has usually been taken up by commentators along with Judges (q.v.). (W. R. S.)

RUTHENIANS. See **SLAVS**. For Ruthenian (Little Russian) literature, see **RUSSIA**.

RUTHENIUM. See **PLATINUM**.

RUTHERFURD, or **RUTHERFORD**, **SAMUEL** (1600–1661), Scottish divine, was born about 1600 at the village of Nisbet in Roxburghshire. He is supposed to have received his early education at Jedburgh, and he entered the university of Edinburgh in 1617. He graduated M.A. in 1621, and two years afterwards was elected professor of humanity. On account of some alleged indiscretion or irregularity connected with his marriage in 1625, he resigned his professorship in that year, but, after studying theology, he was in 1627 appointed minister of Anwoth, Kirkcudbrightshire, where he displayed remarkable diligence and zeal, alike as preacher, pastor, and student, and soon took a leading place among the clergy of Galloway. In 1636 his first book, entitled *Exercitationes de Gratia*—an elaborate treatise against Arminianism—appeared at Amsterdam, and attracted some attention both in Great Britain and on the Continent. Combined with his strict and non-conforming presbyterianism, the severe Calvinism set forth in this work led to a prosecution by the new bishop of the diocese, Sydserff, in the High Commission Court, first at Wigtown and afterwards at Edinburgh, with the result that Rutherford was deposed from his pastoral office, and sentenced to confinement in Aberdeen during the king's pleasure. His banishment lasted from September 1636 to February 1638, and was chiefly remarkable for the epistolary activity he displayed, the greater number of his published *Letters* belonging to this period of his life. He was present at the signing of the Covenant in Edinburgh in 1638, and afterwards at the meeting of the Glasgow Assembly the same year, which restored him to his parish. In 1639 he was appointed professor of divinity in St Mary's College, St Andrews, and shortly afterwards became colleague to Robert Blair in the church of St Andrews. He was sent up to London in 1643 as one of the eight commissioners from Scotland to the Westminster Assembly. Arriving along with Baillie in November, and remaining at his post over three years, he did great service to the cause of his party. In 1642 he had published his *Peaceable and Temperate Plea for Paul's Presbyterie in Scotland*, and the sequel to it in 1644 on *The Due Right of Presbyteries* provoked Milton's contemptuous reference to "mere A. S. and Rutherford" in his sonnet *On the New Forcers of Conscience under the Long Parliament*. In 1644 also appeared Rutherford's *Lex Rex, a Dispute for the Just Prerogative of King and People*, which gives him a recognized place among the early writers on constitutional law; it was followed by *The Divine Right of Church Government* (1646), and *Free Disputation against Pretended Liberty of Conscience* (1649). Among his other works are the *Tryal and Triumph of Faith* (1645), *Christ Dying and Drawing Sinners to Himself* (1647), and *Survey of the Spiritual Antichrist* (1648). In 1647 he returned to St Andrews to become principal of the New College there, and in 1648 and 1651 he declined successive invitations to theological chairs at Harderwijk and Utrecht. His last days were assailed by the persecution which followed the

Restoration in 1660. His *Lex Rex* was ordered to be burned at the cross of Edinburgh, and also at the gate of the college. He was deprived of all his offices, and on a charge of high treason was cited to appear before the ensuing parliament. His health, however, now utterly broke down, and knowing that he had not long to live he drew up, on 26th February 1661, a *Testimony*, which was posthumously published. He died on the 20th of the following March.

The fame of Rutherford now rests principally upon his remarkable *Letters*, on which Wodrow thus comments:—"He seems to have outdone even himself as well as everybody else in his admirable and every way singular letters, which, though jested upon by profane wits because of some familiar expressions, yet will be owned of all who have any relish of piety to contain such sublime flights of devotion and to be freighted with such massy thoughts as loudly speak a soul united to Jesus Christ in the closest embraces, and must needs at once ravish and edify every serious reader." In addition to the other works already mentioned, Rutherford published in 1651 a treatise *De Divina Providentia*, against Molinism, Socinianism, and Arminianism, of which Richard Baxter, not without justice, remarked that "as the *Letters* were the best piece so this was the worst he had ever read."

The *Letters*, to the number of 215, were first published anonymously by M^r Ward, an amanuensis, at Rotterdam, in 1664. They have been frequently reprinted, the best edition (365 letters) being that by Rev. A. A. Bonar, 1848, with a sketch of his life. See also a short *Life* by Rev. Dr Andrew Thomson, 1884.

RUTHERGLEN, an ancient royal burgh of Lanarkshire, Scotland, is situated near the left bank of the Clyde, 2 miles south-east of Glasgow. It consists chiefly of one long wide irregular street, with narrow streets, wynds, and alleys branching from it at intervals. The parish church is situated near the centre of the town, a little distance from the tower of the old church where the treaty was made in 1297 with Edward I., by which Sir John Monteith agreed with the English to betray the Scottish hero Wallace. The most important public building is the town-hall, a handsome structure with a large square tower. In the vicinity there are extensive collieries and ironworks, and the town possesses chemical works, a paper mill, a pottery, and a shipbuilding yard. The corporation consists of a provost, two bailies, a dean of guild, a treasurer, and fifteen councillors. The population of the royal burgh in 1871 was 9239, and in 1881 it was 11,473.

Rutherglen was erected into a royal burgh by King David in 1126. At this time it included a portion of Glasgow, but in 1226 the boundaries were rectified so as to exclude the whole of that city. In early times it had a castle, which was taken by Bruce from the English in 1313. It was kept in good repair till after the battle of Langside it was burnt by order of the regent Murray. After this the town for a time gradually decayed, the trade being absorbed by Glasgow. Rutherglen is included in the Kilmarnock district of parliamentary burghs.

RUTILIUS CLAUDIUS NAMATIUS is known to us as the author of a Latin poem in elegiac metre, describing a coast voyage from Rome to Gaul in 416 A.D. The literary excellence of the work and the flashes of light which it throws across a momentous but dark epoch of history combine to give it exceptional importance among the relics of late Roman literature. The poem was in two books; the exordium of the first and the greater part of the second have been lost. What remains consists of about 700 lines.

The poet's voyage took place in the late autumn of 416 (i. 135 sq.), and the verses as we have them were evidently written at or very near the time. The author is a native of southern Gaul, and belonged, like Sidonius, to one of the great governing families of the Gaulish provinces. His father, whom he calls Lachanius, had held high offices in Italy and at the imperial court, had been governor of Etruria and Umbria (*consularis Tusciae*) probably in 389, when a Claudius is named in the Theodosian Code (2, 4, 5) as having held the office, then imperial treasurer (*comes sacrarum largitionum*), imperial recorder (*quaestor*), and governor of the capital itself (*praefectus*

urbis). Rutilius boasts his career to have been no less distinguished than his father's, and particularly indicates that he had been secretary of state (*magister officiorum*) and governor of the capital (i. 157, 427, 467, 561). It is probable that a certain Namatius named in the Theodosian Code (6, 27, 15) as *magister officiorum* of the year 412 is no other than our poet. The true literary man is apt to be inordinately proud of political distinction, and Rutilius celebrates his own praises in a style worthy of Cicero or Pliny. At all events, he had lived long in the great world of the Western empire, and knew much of the inner history of his time. After reaching manhood, he had passed through the tempestuous period that stretches between the death of Theodosius (395) and the fall of the usurper Attalus, which occurred near the date when our poem was written. He had witnessed the chequered career of Stilicho as actual, though not titular, emperor of the West; he had seen the hosts of Radagaisus rolled back from Italy, only to sweep over the helpless provinces of Gaul and Spain, the defeats and triumphs of Alaric, the three sieges and final sack of Rome, followed by the marvellous recovery of the city, Heraclian's vast armament dissipated by a breath, and the fall of seven pretenders to the Western diadem. Undoubtedly the sympathies of Rutilius were with those who during this period dissented from, and, when they could, opposed, the general tendencies of the imperial policy. We know from himself that he was the intimate of distinguished men who belonged to the circle of the great orator Symmachus,—men who had scouted Stilicho's compact with the Goths, and had led the Roman senate to support the pretenders Eugenius and Attalus in the vain hope of reinstating the gods whom Julian had failed to save.

While making but few direct assertions about historical characters or events, the poem, by its very texture and spirit and assumptions, forces on us important conclusions concerning the politics and religion of the time, which are not brought home to us with the same directness by any other authority. The attitude of the writer towards paganism is remarkable. The whole poem is intensely pagan, and is penetrated by the feeling that the world of literature and culture is and must remain pagan, that outside paganism lies a realm of barbarism. The poet wears an air of exalted superiority over the religious innovators of his day, and entertains a buoyant confidence that the future of the ancient gods of Rome will not belie their glorious past. Invective and apology he scorns alike, nor troubles himself to show, with Claudian, even a suppressed grief at the indignities put upon the old religion by the new. As a statesman, he is at pains to avoid offending those politic Christian senators over whom pride in their country had at least as great power as attachment to their new religion. Only once or twice does Rutilius speak directly of Christianity, and then only to attack the monks, whom the temporal authorities had hardly as yet recognized, and whom, indeed, only a short time before, a Christian emperor had forced by thousands into the ranks of his army. Judaism Rutilius could assail without wounding either pagans or Christians, but he intimates, not obscurely, that he hates it chiefly as the evil root whence the rank plant of Christianity had sprung.

We read in Gibbon that "Honorius excluded all persons who were adverse to the catholic church from holding any office in the state," that he "obstinately rejected the service of all those who dissented from his religion," and that "the law was applied in the utmost latitude and rigorously executed." Far different is the picture of political life impressed upon us by Rutilius. His voice is assuredly not that of a partisan of a discredited and overborne faction. We see by the aid of his poem a senate at Rome composed of past office-holders, the majority of whom were certainly pagan still. We discern a Christian section whose Christianity was political rather than religious, who were Romans first and Christians afterwards, whom a new breeze in politics might easily have wafted back to the old religion. Between these two sections the broad old Roman toleration reigns. Some ecclesiastical historians have fondly imagined that after the sack of Rome the bishop Innocent returned to a position of practical predominance. No one who fairly reads Rutilius can cherish this idea. The air of the capital, perhaps even of Italy, was still charged with paganism. The court was far in advance of the people, and the persecuting laws were in large part incapable of execution.

Perhaps the most interesting lines in the whole poem are those in which Rutilius assails the memory of "dire Stilicho," as he names him. Stilicho, "fearing to suffer all that had caused himself to be feared," annihilated those defences of Alps and Apennines which the provident gods had interposed between the barbarians and the Eternal City, and planted the cruel Goths, his "skin-clad" minions, in the very sanctuary of the empire. His wife was wickeder than the wife of the Trojan horse, than the wife of Althæa or of Scylla. May Nero rest from all the torments of the damned, that they may seize on Stilicho, for Nero smote his own mother, but Stilicho, the mother of the world!

We shall not err in supposing that we have here (what we find nowhere else) an authentic expression of the feeling entertained by a majority of the Roman senate concerning Stilicho. He had but imitated the policy of Theodosius with regard to the barbarians; but even that great emperor had met with passive opposition from the old Roman families. The relations, however, between Alaric and Stilicho had been closer and more mysterious than those between Alaric and Theodosius, and men who had seen Stilicho surrounded by his bodyguard of Goths not unnaturally looked on the Goths who assailed Rome as Stilicho's avengers. It is noteworthy that Rutilius speaks of the crime of Stilicho in terms far different from those used by Orosius and the historians of the lower empire. They believed that Stilicho was plotting to make his son emperor, and that he called in the Goths in order to climb higher. Rutilius holds that he used the barbarians merely to save himself from impending ruin. The Christian historians assert that Stilicho designed to restore paganism. To Rutilius he is the most uncompromising foe of paganism. His crowning sin (recorded by our poet alone) was the destruction of the Sibylline books—a sin worthy of one who had decked his wife in the spoils of Victory, the goddess who had for centuries presided over the deliberations of the senate. This crime of Stilicho alone is sufficient in the eyes of Rutilius to account for the disasters that afterwards befell the city, just as Merobaudes, a generation or two later, traced the miseries of his own day to the overthrow of the ancient rites of Vesta.

With regard to the form of the poem, Rutilius handles the elegiac couplet with great metrical purity and freedom, and betrays many signs of long study in the elegiac poetry of the Augustan era. The Latin is unusually clean for the times, and is generally fairly classical both in vocabulary and construction. The taste of Rutilius too is comparatively pure. If he lacks the genius of Claudian, he also lacks his overloaded gaudiness and his large exaggeration, and the directness of Rutilius shines by comparison with the laboured complexity of Ausonius. It is common to call Claudian the last of the Roman poets. That title might fairly be claimed for Rutilius, unless it be reserved for Merobaudes. At any rate in passing from Rutilius to Sidonius no reader can fail to feel that he has left the region of Latin poetry for the region of Latin verse.

Of the many interesting details of the poem we can only mention a few. At the outset we have an almost dithyrambic address to the goddess Roma, whose glory has ever shone the brighter for disaster, and who will rise once more in her might and confound her barbarian foes. The poet shows as deep a consciousness as any modern historian that the grandest achievement of Rome was the spread of law. Next we get incidental but not unimportant references to the destruction of roads and property wrought by the Goths, to the state of the havens at the mouths of the Tiber and the general decay of nearly all the old commercial ports on the coast. Most of these were as desolate then as now. Rutilius even exaggerates the desolation of the once important city of Cosa in Etruria, whose walls have scarcely changed from that day to ours. The port that served Piseæ, almost alone of all those visited by Rutilius, seems to have retained its prosperity, and to have foreshadowed the subsequent greatness of that city. At one point on the coast the villagers everywhere were "soothing their wearied hearts with holy merriment," and were celebrating the festival of Osiris.

All existing MSS. of Rutilius are later than 1494, and are copies from a lost copy of an ancient MS. once at the monastery of Bobio, which disappeared about 1700. The *editio princeps* is that by J. B. Pius (Bologna, 1520), and the principal editions since have been those by Barth (1623), P. Burman (1731, in his edition of the minor Latin poets), Wernsdorf (1778, part of a similar collection), Zumpt (1840), and the critical edition by Lucian Müller (Teubner, Leipzig, 1870). Müller writes the poet's name as Claudius Rutilius Namatianus, instead of the usual Rutilius Claudius Namatianus; but if the identification of the poet's father with the Claudius mentioned in the Theodosian Code be correct, Müller is probably wrong. Rutilius receives more or less attention from all writers on the history or literature of the times, but a lucid chapter in Beugnot, *Histoire de la Destruction du Paganisme en Occident* (1835), may be especially mentioned. It should be noted that in using the passage concerning Stilicho we have ventured to read the line at ii. 45 thus—*Illicae cladis deteriore dolo*; the change from the MSS. reading *Illicae cladis liberiore dolo* (preserved in all editions) seems demanded by the context, as well as by the sense. (J. S. R.)

RUTLAND, the smallest county in England, is bounded See N. and N.E. by Lincolnshire, S.E. by Northamptonshire, vol. xiv. and W. by Leicestershire. Its shape is extremely irregular. Pl. VI. The greatest length from north-east to south-west is about

20 miles, and the greatest breadth from east to west about 16 miles. The area is 94,889 acres, or about 148 square miles. The surface is pleasantly undulating, ridges of high ground running east and west, separated by rich and luxuriant valleys, generally about half a mile in breadth. The principal valley is that of Catmoss to the south of Oakham, having to the north of it a tract of table-land commanding an extensive prospect into Leicestershire.

The Welland, which is navigable to Stamford, flows north-east, forming the greater part of the boundary of the county with Northamptonshire. The Gwash or Wash, which rises in Leicestershire, flows eastwards through the centre of the county, and just beyond its borders, enters the Welland in Lincolnshire. The Chater, also rising in Leicestershire and flowing eastwards enters the Welland about two miles from Stamford. The Eye flows south-eastwards along the borders of Leicestershire. The county belongs almost entirely to the Jurassic formation, consisting of Liassic and Oolitic strata—the harder strata, chiefly limestone containing iron, forming the hills and escarpments, and the clay-beds the slopes of the valleys. The oldest rocks are those belonging to the Lower Lias in the north-west. The bottom of the vale of Catmoss is formed of marlstone rock belonging to the Middle Lias, and its sides are composed of long slopes of Upper Lias clay. The Upper Lias also covers a large area in the west of the county. The lowest series of the Oolitic formation is the Northampton sands bordering Northamptonshire. The Lincolnshire Oolitic limestone prevails in the east of the county north of Stamford. It is largely quarried for building purposes, the quarry at Ketton being famous beyond the boundaries of the county. The Great Oolite prevails towards the south-east. Formerly the iron was largely dug and smelted by means of the wood in the extensive forests, and the industry is again reviving.

Agriculture.—In the eastern and south-eastern districts the soil is light and shallow. In the other districts it consists chiefly of a tenacious but fertile loam, and in the fertile vale of Catmoss the soil is either clay or loam, or a mixture of the two. The prevailing redness, which colours even the streams, is owing to the ferruginous limestone carried down from the slopes of the hills. The name of the county is by some authorities derived from this characteristic of the soil, but the explanation is doubtful. The eastern portions of the county are chiefly under tillage and the western in grass. Out of 94,889 acres no fewer than 86,477 acres in 1885 were under cultivation, corn crops occupying 22,820 acres, green crops 7520 acres, rotation grasses 6553 acres, and permanent pasture 47,816 acres. Over 3000 acres were under woodland. The principal corn crop is barley, which occupied 9484 acres, but wheat and oats are also largely grown. Turnips and swedes occupy about five-sixths of the area under green crops. The rearing of sheep and cattle occupies the chief attention of the farmer. Large quantities of cheese are manufactured and sold as Stilton. Cattle, principally shorthorns, numbered 19,810, of which 8054 were cows and heifers in milk and in calf. Sheep—Leicesters and South Downs—numbered 80,881, horses 3062, pigs 3054, and poultry 27,376. According to the parliamentary return of 1873 the number of proprietors was 1425, of whom 861 possessed less than one acre. The largest proprietors were the earl of Gainsborough 15,076, Lord Aveland 13,634, marquis of Exeter 10,713, and George H. Finch 9182.

Railways.—The main line of the Great Northern intersects the north-eastern corner of the county, and branches of that system, of the London and North-Western, and of the Midland connect it with all parts of the country.

Administration and Population.—Rutland comprises five hundreds and contains fifty-seven civil parishes, and part of the parish of Stoke-Dry, which extends into Leicestershire. Formerly represented by two members of parliament, since 1885 it returns one only. There is no municipal or parliamentary borough. The county has one court of quarter sessions, but is not subdivided for petty sessional purposes. Ecclesiastically it is entirely in the diocese of Peterborough. The population was 21,861 in 1861, 22,073 in 1871, and 21,434 in 1881. The average number of persons to an acre in 1881 was 0.23, and of acres to a person 4.43.

History and Antiquities.—In the time of the Romans the district now included in Rutlandshire was probably inhabited by the Coritani, and was included in Flavia Cæsariensis. Ermyrn

Street traversed it in the north-east, and there was an important station at Great Casterton. As a shire it is later than Domesday, when a portion of it was included in Northamptonshire but the greater part in Nottingham. It is referred to as com. Roteland in the fifth year of King John, in the document assigning a dowry to Queen Isabella, but for a long time previous to this the name Roteland was applied to Oakham and the country round it. Edward, eldest son of Edmund of Langley, fifth son of Edward III., was created earl of Rutland, but the title became extinct in the royal house when Edward earl of Rutland was stabbed to death at the battle of Clifford. In 1525 the title was revived in the person of Lord Ros, and the tenth earl was created duke in 1703. At the battle of Stamford in 1470 the Lancastrians suffered defeat. The only old castle of which there are important remains is Oakham, dating from the time of Henry II., and remarkable for its Norman hall.

RUTLAND, a township and village of the United States, capital of Rutland county, Vermont, 167 miles north-north-west of Boston. It is an important railway junction, being the terminus of several minor lines and the seat of machine-shops and engine-houses; but its name is even better known through its quarries of white marble. The population of the township was 12,149 and that of the village 7502 in 1880.

Chartered by New Hampshire in 1761 and again chartered as Socialborough in 1772 by New York, Rutland became in 1775 a fortified post on the great northern military road, and in 1781 was made the chief town of Rutland county. Between 1784 and 1804 it was one of the capitals of the State.

RUYSBROECK, or **RUYSBROEK**, JOHN, mystic, was born at Ruysbroek, near Brussels, about 1293, and died as first prior of the convent of Groenendael, near Waterloo, in 1381. See **MYSTICISM**, vol. xvii. p. 133.

RUYSCH, **FREDERIK** (1638–1731), anatomist, was born at The Hague in 1638, and died at Amsterdam on February 22, 1731. See **ANATOMY**, vol. i. p. 812.

RUYSDAEL, or **RUISDAAL**, **JACOB** (c. 1625–1682), the most celebrated of the Dutch landscapists, was born at Haarlem about 1625. The accounts of his life are very conflicting, and recent criticism and research have discredited much that was previously received as fact regarding his career. He appears to have studied under his father Izaak Ruysdael, a landscape-painter, though other authorities make him the pupil of Berghem and of Albert van Everdingen. The earliest date that appears on his paintings and etchings is 1645. Three years later he was admitted a member of the guild of St Luke in Haarlem; in 1659 he obtained the freedom of the city of Amsterdam, and we know that he was resident there in 1668, for in that year his name appears as a witness to the marriage of Hobbema. During his lifetime his works were little appreciated, and he seems to have suffered from poverty. In 1681 the sect of the Mennonites, with whom he was connected, petitioned the council of Haarlem for his admission into the almshouse of the town, and there the artist died on the 14th of March 1682.

The works of Ruysdael may be studied in the Louvre and the National Gallery, London, and in the collections at The Hague, Amsterdam, Berlin, and Dresden. His favourite subjects are simple woodland scenes, similar to those of Everdingen and Hobbema, or views of picturesque mills and cottages, or of ruined towers and temples, set upon broken ground, beside streams or waterfalls. He is especially noted as a painter of trees, and his rendering of foliage, particularly of oak leafage, is characterized by the greatest spirit and precision. His views of distant cities, such as that of Haarlem in the possession of the marquis of Bute, and that of Katwijk in the Glasgow Corporation Galleries, clearly indicate the influence of Rembrandt. He frequently paints coast-scenes, and sea-pieces with breaking waves and stormy skies filled with wind-driven clouds, but it is in his rendering of lonely forest glades that we find him at his best. The subjects of certain of his mountain scenes, with bold rocks, waterfalls, and fir-trees, seem to be taken from Norway, and have led to the supposition that he had travelled in that country. We have, however, no record of such a journey, and the works in question are probably merely adaptations from the landscapes of Van Everdingen, whose manner he copied at one period. Only a single architectural sub-

ject from his brush is known—an admirable interior of the New Church, Amsterdam, in the possession of the marquis of Bute. The prevailing hue of his landscapes is a full rich green, which, however, has darkened with time, while a clear grey tone is characteristic of his sea-pieces.

The art of Ruysdael, while it shows little of the scientific knowledge of later landscapists, is sensitive and poetic in sentiment, and direct and skilful in technique. Figures are sparingly introduced into his compositions, and such as occur are believed to be from the pencils of Adrian Vandewelde, Philip Wouwerman, and Jan Lingelbach. In his love of landscape for itself, in his delight in the quiet and solitude of nature, the painter is thoroughly modern in feeling.

Ruysdael etched a few plates, which were reproduced by Amand Durand in 1878, with text by M. Georges Duplessis. The "Champ de Blé" and the "Voyageurs" are characterized by M. Duplessis as "estampes de haute valeur qui peuvent être regardées comme les spécimens les plus significatifs de l'art du paysagiste dans les Pays-Bas."

RUYSSELEDE, or **RUISSELEDE**, a market-town of Belgium, in the province of West Flanders, 15 miles south-east of Bruges. It is best known as the seat of a great reformatory for boys, founded by the Government in 1849. The population was 6663 in 1874, and 6670 in 1881.

RUÿTER, **MICHAEL ADRIAN DE** (1607–1676), a distinguished Dutch naval officer, was born at Flushing, 24th March 1607. He began his seafaring life at the age of eleven as a cabin boy, and in 1636 was entrusted by the merchants of Flushing with the command of a cruiser against the French pirates. In 1640 he entered the service of the States, and, being appointed rear-admiral of a fleet fitted out to assist Portugal against Spain, specially distinguished himself at Cape St Vincent, 3d November 1641. In the following year he left the service of the States, and, until the outbreak of war with England in 1652, held command of a merchant vessel. In 1653 a squadron of seventy vessels was despatched against the English, under the command of Admiral Tromp. Ruyter, who accompanied the admiral in this expedition, seconded him with great skill and bravery in the three battles which were fought with the English. He was afterwards stationed in the Mediterranean, where he captured several Turkish vessels. In 1659 he received a commission to join the king of Denmark in his war with the Swedes. As a reward of his services, the king of Denmark ennobled him and gave him a pension. In 1661 he grounded a vessel belonging to Tunis, released forty Christian slaves, made a treaty with the Tunisians, and reduced the Algerine corsairs to submission. From his achievements on the west coast of Africa he was recalled in 1665 to take command of a large fleet which had been organized against England, and in May of the following year, after a long contest off the North Foreland, he compelled the English to take refuge in the Thames. On June 7, 1672, he fought a drawn battle with the combined fleets of England and France, in Southwold or Sole Bay, and after the fight he convoyed safely home a fleet of merchantmen. His valour was displayed to equal advantage in several engagements with the French and English in the following year. In 1676 he was despatched to the assistance of Spain against France in the Mediterranean, and, receiving a mortal wound in the battle on the 21st April off Messina, died on the 29th at Syracuse. A patent by the king of Spain, investing him with the dignity of duke, did not reach the fleet till after his death. His body was carried to Amsterdam, where a magnificent monument to his memory was erected by command of the states-general.

See *Life of Ruyter* by Brandt, Amsterdam, 1687, and by Klopp, 2d ed., Hanover, 1858.

RYAZAN, a government of Central Russia, is bounded by Moscow and Tula on the W., by Vladimir on the N., and by Tamboff on the E. and S., with an area of 16,255 square miles, and a population of 1,713,581 in 1882.

Ryazan is an intermediate link between the central Great Russian governments and the Steppe governments of the south-east,—the wide and deep valley of the Oka, by which it is traversed from west to east, with a broad curve to the south, being the natural boundary between the two. On the left of the Oka the surface often consists of sands, marshes, and forests; while on the right the fertile black-earth prairies begin, occupying especially the southern part of the government (the districts of Rananburg, Sapojok, and Dankoff). The whole of Ryazan is a plateau about 700 feet above the sea, but deeply cut by the river valleys and numerous ravines. The geological formations represented are the Devonian, the Carboniferous, the Jurassic, and the Quaternary. The Devonian appears in the deeper valleys in the south, and belongs to the well-known "Malevka-Muraevnya horizon," now considered as equivalent to the *Cypridina serrato-striata* Upper Devonian deposits of the Eifel. The Carboniferous deposits are widely spread, and appear at the surface in the bottoms of the ravines and valleys. They contain strata of excellent coal between plastic blue clays, which are worked at several places. Upper Carboniferous limestones, as also sandstones, the age of which has not yet been determined, but which seem to be Lower Jurassic, cover the Carboniferous clays. The Upper Jurassic deposits are widely spread, but they have been much destroyed and now appear as separate insular tracts. They belong to the Oxford and Callovian horizons, the former containing corals, which are very rare on the whole in the Russian Jurassic deposits. The Quaternary deposits are represented by the Glacial boulder clay and more recent alluvial deposits, which occupy wide areas in the valley of the Oka. Iron-ores, limestone, grindstone grits, potters' clays, and thick beds of peat are worked, besides coal. The northern parts of Ryazan belong to the forest regions of Russia, and, notwithstanding the wholesale destruction of forests in that part of the country, these (chiefly Coniferous) still cover one-third of the surface in several districts. In the south, where the proximity of the Steppes is felt, they are much less extensive, the prevailing species being oak, birch, and other deciduous trees. They cover an aggregate area of more than 2 million acres.

The Oka is the chief river; it is navigable throughout, and receives the navigable Pronya, Fra, and Tsna, besides a great many smaller streams utilized for floating timber. Steamers ply on the Oka to Kasimoff and Nijni Novgorod. The Don and the Lyesnoi Voronezh belong to Ryazan in their upper courses only. On the whole, the south districts are not well watered. Small lakes are numerous in the broad depression of the Oka and elsewhere, while extensive marshes cover the north-east districts; a few attempts at draining several of these on the banks of the Oka have resulted in the reclamation of excellent pasture lands. The climate is a little warmer than at Moscow, the average temperature at Ryazan being 41°.

The territory of Ryazan was occupied in the 9th century by Finnish stems (Mordvinians, Mers, Muroms, and Meschers), which for the most part have either given way before or disappeared amongst the Slavonian colonizers. The population is now Great Russian throughout, and contains only a trifling admixture of some 6000 Tartars, 1500 Poles, and 500 Jews in towns. Some Tartars immigrated into the Kasimoff region in the 15th century, and are noted for their honesty of character as well as for their agricultural prosperity. The people of the Pra river are described as Mescheriaks, but their manners and customs do not differ from those of the Russians.

The chief occupation in Ryazan is agriculture. Out of 10,100,000 acres only 838,000 are unfit for tillage. 5,482,000 acres are under crops, and the annual produce is estimated at about 4,248,000

quarters of corn and 972,000 quarters of potatoes. The area under cultivation and the crops themselves are increasing, as also is the export of corn. But even here, in one of the wealthiest governments of Russia, the situation of the peasants is far from satisfactory. Cattle-breeding is rapidly falling off on account of want of pasture lands, but hay, which is abundant, especially on the rich meadow lands of the Oka, is exported. In 1882 there were 283,500 horses, 262,200 cattle, and 839,600 sheep, the figures having been 446,000, 297,000, and 847,000 respectively in 1858. In the northern part of the government various industries are carried on, such as boatbuilding, the preparation of pitch and tar, the manufacture of wooden vessels, sledges, &c. Various other petty trades, such as weaving, lace-making, and boot-making, are combined with agriculture. Manufactures also have lately begun to make progress, and in 1882 their aggregate production reached 13,000,000 roubles (cotton and flax-spinning mills, glass-works and metal-ware works, and distilleries, the last-named producing to the value of 1,850,000 roubles). Trade, especially in corn and other agricultural produce and in merchandise manufactured in the villages, is very active. The railway from Ryazan to Moscow is one of the most important in Russia, from the amount of goods carried from the south-east Steppe governments. The Oka is another artery of traffic, the aggregate amount shipped to or sent from its ports within Ryazan reaching 3,634,000 cwts. in 1880. The government is divided into twelve districts, the chief towns of which, with their populations in 1883, are subjoined: Ryazan (30,325 inhabitants), Dankoff (2475), Egorievsk (6055), Kasimoff (15,260), Mikhailoff (2720), Pronsk (1740), Raneburg (4500), Ryazhsk (4265), Sapojok (2670), Skopin (10,260), Spassk (4320), and Zaisk (5870). Raneburg, Skopin, and Zaisk are important markets for corn and hemp. Several villages, such as Muraevnya, Dyedynovo (6600) and Lovtsy (loading places on the Oka), and Ukolovo (market for corn), have more commerce and industry than the district towns. Large villages are numerous, about sixty having each from 2500 to 7000 inhabitants.

The Slavonians began to colonize the region of Ryazan as early as the 9th century, penetrating thither both from the north-west (Great Russians) and from the Dnieper (Little Russians). As early as the 10th century the principality of Murom and Ryazan is mentioned in the chronicles. During the following centuries this principality increased both in extent and in wealth and included parts of what are now the governments of Kaluga and Moscow. Owing to the fertility of the soil, its Russian population rapidly increased, while the Finnish stems which formerly inhabited it migrated farther east, or became merged among the Slavonians. A dozen towns, all fortified and commercial, are mentioned as belonging to the principality towards the end of the 12th century. The Mongolian invasion stopped all this development. The horsemen of Batu burned and destroyed several towns in 1237, and killed many people, desolating the country. The principality, however, still continued to exist; its great princes strongly opposed the annexation plans of Moscow, making alliance with the Mongols and with Lithuania, but they succumbed, and, the last of them, Ivan, having been imprisoned in Moscow, his principality was definitively annexed in 1517.

RYAZAN, capital of the above government, lies 119 miles to the south-east of Moscow, on the elevated right bank of the Trubej, a mile above its junction with the Oka. A wide prairie dotted with large villages, being the bottom of a former lake, spreads out from the base of the crag on which Ryazan stands, and has the aspect of an immense lake when it is inundated in the spring. Except one or two streets, the town is badly built, chiefly of wood, and ill-paved. It has often suffered from fire, and has few remains of former days. The large church of Uspensk dates from 1770. Those of Arkhangelsk and Kretovozdvijensk have preserved, however, their old architecture, though obliterated to some extent by subsequent repairs, as also the archiepiscopal palace, formerly the "terem" of the great princes. The industries are undeveloped, and the trade has less importance than might be expected from the position of the town in so rich a region. It is, however, an important railway centre, no less than 15,000,000 cwts., chiefly of corn, being brought from the south-east and sent on to Moscow, while nearly 3,390,000 cwts. of various manufactured and grocery wares are conveyed in the opposite direction. The loading place on the Oka also has some importance. The population, 30,325 in 1883, is increasing but slowly.

The capital of Ryazan principality was Ryazan—now Old Ryazan, a village close to Spassk, also on the Oka. It is mentioned in

annals as early as 1097, but continued to be the chief town of the principality only until the 14th century. In the 11th century one of the Kieff princes—probably Yaroslav Svyatoslavich in 1095—founded, on the banks of a small lake, a fort which received the name of Pereyaslaw-Ryazanskiy. In 1294 (or in 1335) the bishop of Murom, compelled to leave his own town and probably following the usual policy of that epoch,—that of selecting a new town with no municipal traditions, as the nucleus of a new state,—settled in Pereyaslaw-Ryazanskiy, and thus gave new importance to this formerly insignificant settlement. The great princes of Ryazan followed his example and by-and-by completely abandoned the old republican town of Ryazan, transferring also its name to Pereyaslaw-Ryazanskiy. In 1300 a congress of Russian princes was held there, and in the following year the town was taken by the Moscow prince. It continued, however, to be the residence of the Ryazan princes until 1517. In 1365 and 1377 it was plundered and burned by Tartars, but in the two following centuries (in 1460, 1513, 1521, and 1564) it was strong enough to repel them. Earthen walls with towers were erected after 1301; and in the 17th century a "kreml" still stood on the high crag above the Trubej. Ryazan became chief town of the Ryazan lieutenancy in 1778.

RYBINSK, or RUBINSK, though but a district town of the government of Yaroslavl, with a permanent population (1883) of only 18,900, is, as being virtually the port of St Petersburg on the Volga, one of the most important towns of the northern part of Central Russia. It lies 54 miles to the north-west of Yaroslavl, and is connected by rail (186 miles) with Bologoye, on the line between St Petersburg and Moscow. It derives its importance from its situation on the Volga, opposite the mouth of the Sheksna,—one of those tributaries which, flowing from the north-west, have since the dawn of Russian history connected the Volga with the regions around Lake Ladoga. Russians settled there as early as the 12th century, or perhaps earlier; subsequently it seems to have become a mere fishing station under Moscow, with perhaps some shipbuilding. It became a considerable centre for traffic when the Vyshnevolotsk, Tikhvinsk, and Mariinsk canal systems, connecting St Petersburg with the Volga, were opened. The cargoes of the larger boats from the lower Volga, consisting mainly of corn and flour, as also of salt, spirits, potash, and tallow, are here transferred to smaller boats capable of accomplishing the navigation to St Petersburg, and *vice versa*. The amount of goods thus transhipped is estimated at 16,000,000 cwts., worth 32,800,000 roubles. Since the opening of the line to Bologoye, a large proportion of this merchandise is sent to St Petersburg by rail (9,293,000 cwts. in 1880). The total number of boats visiting Rybinsk annually is estimated at 5000 to 7000, their aggregate cargoes amounting to nearly 20,000,000 cwts. (about 40,000,000 roubles). Upwards of 100,000 labourers (male and female) assemble at Rybinsk during the navigation, and the number of vessels is so great as to cover the Volga and the Sheksna like a bridge. Besides the business of transshipment, Rybinsk has an active trade in corn, hemp, &c., from the neighbouring districts. The town is but poorly built, and its sanitary condition leaves very much to be desired, especially in summer.

RYCAUT, or RICAUT, SIR PAUL (d. 1700), traveller and diplomatist, was the tenth son of Sir Peter Ricaut, a Royalist who on account of his support of King Charles had to pay a composition of £1500. The son was admitted a scholar of Trinity College, Cambridge, in 1647, and took his B.A. degree in 1650. After travelling in Europe and in various parts of Asia and Africa, he in 1661 accompanied as secretary the earl of Winchelsea, ambassador extraordinary to Turkey. During a residence there of eight years he wrote *The Present State of the Ottoman Empire, in three books; containing the Maxims of the Turkish Politie, their Religion and Military Discipline* (1670; 4th ed., 1686; Fr. transl. by Briot, 1670; and another with notes by Besprier, 1677). In 1663 he pub-

lished at Constantinople *The Capitulation, Articles of Peace, &c., concluded between the King of England and the Sultan of the Ottoman Empire*. Subsequently he was for eleven years consul at Smyrna, and at the command of Charles II. wrote *The Present State of the Greek and Armenian Churches, Anno Christi 1678*, which on his return to England he presented to the king and published in 1679. In 1685 Lord Clarendon, lord lieutenant of Ireland, made him principal secretary for the provinces of Leinster and Connaught. He at the same time received from James II. the honour of knighthood, was made a member of the privy council of Ireland, and named judge of the high court of admiralty, which office he retained till 1688. From 1690 to 1700 he was employed by King William as English resident at the Hanse towns, and shortly after his return to England, worn out with age and infirmities, he died on the 16th December 1700.

Rycaut was a fellow of the Royal Society, and wrote an article on Sable Mice which was published in their *Transactions*. In addition to the works already mentioned he was the author of *A Continuation of Knolles' History of the Turks from 1623 to 1677* (1680), and from 1679 to 1699 (1700); *A Translation of Platina's Lives of the Popes, with a Continuation from 1471 to the Present Time* (1685); *The Critick, from the Spanish of Gracian* (1686); and the *Royal Commentaries of Peru, from the Spanish of Garcilasso* (1688).

RYDE, a municipal borough and watering place of the Isle of Wight, is finely situated on a sloping eminence above the Solent, 5 miles south by west of Portsmouth, and 7 (12 by rail) from West Cowes. It occupies the site of a village called La Rye or La Riche, which was destroyed by the French in the reign of Edward II. About the close of the 18th century it was a small fishing hamlet, but when the beauty of its site attracted attention it rapidly grew into favour as a watering-place. The streets are wide, regular, and well-paved, and there are a large number of fine villas on the slopes of the hill. It is connected by rail with the principal other towns in the island, and there is also steamboat communication with Portsmouth, Southampton, Southsea, Portsea, and Stoke's Bay. The pier, built originally in 1812, but since then greatly extended, forms a delightful promenade half a mile in length. The principal buildings are All Saints church, erected in 1870 from the designs of Sir Gilbert Scott, and other churches, the market-house and town hall, the Royal Victoria Yacht club-house, the theatre, and the Royal Isle of Wight Infirmary. The town was incorporated in 1868, and is governed by a mayor, six aldermen, and eighteen councillors. The population of the municipal borough (area 792 acres) in 1871 was 11,260 and in 1881 it was 11,461.

RYE. As in the case of other cereals, it is doubtful if rye (*Secale cereale*) exists at the present time in a truly wild state. The best evidence on this point goes to show that the plant is a native of the regions between the Black and Caspian Seas. It is also recorded from Afghanistan and Turkestan; but botanists are very chary about admitting the validity of the evidence hitherto adduced. Aitchison, the latest investigator of the flora of Afghanistan, mentions it as growing in wheat-fields, where it is considered as a weed, not being intentionally sown. In some fields "it almost eradicates the wheat crop." But this merely shows that the conditions are more favourable to the growth of rye than to that of wheat. In spite of the uncertainty as to the precise origin of the cultivated plant, its cultivation does not appear to have been practised at a very early date, relatively speaking. Alphonse de Candolle, who has collected the evidence on this point, draws attention to the fact that no traces of this cereal have hitherto been found in Egyptian monuments or in the earlier Swiss dwellings, though seeds have been found in association with weapons of the Bronze period at

Olmütz. The absence of any special name for it in the Semitic, Chinese, and Sanskrit languages is also adduced as an indication of its comparatively recent culture. On the other hand, the general occurrence of the name in the more modern languages of northern Europe, under various modifications, points to the cultivation of the plant then, as now, in those regions. The origin of the Latin name *secale*, which exists in a modified form among the Basques and Bretons, is not explained. The circumstances that the cultivation of rye is relatively not of great antiquity and that it is confined to a relatively restricted area must be taken into account, in connexion with the fact that the variations of this cereal are much fewer than are noted in the case of other plants of like character.

The fact stated by Müller that the anthers and stigmas of the flowers come to maturity at the same time would tend to "close fertilization" and a consequent constancy of "characters" in the offspring, and, as a matter of fact, the varieties of this grass are not numerous. Rye is a tall-growing annual grass, with fibrous roots, flat, narrow, ribbon-like bluish-green leaves, and erect or decurved cylindrical slender spikes like those of barley. The spikelets contain two or three flowers, of which the uppermost is usually imperfect. The outer glumes are acute glabrous, the flowering glumes lance-shaped, with a comb-like keel at the back, and the outer or lower one prolonged at the apex into a very long bristly awn. Within these are three stamens surrounding a compressed ovary, with two feathery stigmas. When ripe, the grain is of an elongated oval form, with a few hairs at the summit.

In the southern parts of Great Britain rye is chiefly or solely cultivated as a forage-plant for cattle and horses, being usually sown in autumn for spring use, after the crop of roots, turnips, &c., is exhausted, and before the clover and lucerne are ready. For forage purposes it is best to cut early, before the leaves and haulms have been exhausted of their supplies to benefit the grain. In the northern parts of Europe, and more especially in Scandinavia, Russia, and parts of northern Germany, rye is the principal cereal; and in nutritive value, as measured by the amount of gluten it contains, it stands next to wheat, a fact which furnishes the explanation of its culture in northern latitudes ill-suited for the growth of wheat. Rye-bread or black-bread is in general use in northern Europe, but finds little favour with those unaccustomed to its use, owing to its sour taste, the sugar it contains rapidly passing into the acetous fermentation.

When the ovaries of the plant become affected with a peculiar fungus (*Cordyceps*), they become blackened and distorted, constituting *ERGOT* (*q.v.*).

RYE, a municipal town and seaport at the eastern extremity of the county of Sussex, 63 miles south-south-east of London, is built upon a rocky eminence which two or three centuries ago was washed on all sides by the influx of the tide, but now, in consequence of the gradual recession of the sea, lies two miles inland. It is surrounded by rich marsh land through which flows the river Rother, uniting at the south-east foot of the rock with two rivulets to form a small serpentine estuary, Rye harbour, the mouth of which is connected with the town by means of a branch line of railway. In bygone years, when the adjacent marshes were flooded with tidal water, the efflux was so powerful as to effectually maintain safe and free entrance into Rye harbour; and in the reign of Charles II. a frigate of 50 guns could enter and ride at anchor. Now the harbour suffers seriously from the shifting sand and shingle, and considerable sums of money have been expended by the harbour commissioners with the view of overcoming these impediments, with but partial success. The trade is chiefly in coal, timber,

and bark, and shipbuilding is carried on as well as fishing. There is a large market every alternate Wednesday, and considerable business in cattle, sheep, corn, wool, and hops is transacted. Rye is a quaint, compactly-built town perched upon the rock to which for centuries it was restricted, but in the course of the last half-century it has gradually extended itself over the northern slopes beyond the town wall. It is excellently drained, abundantly supplied with clear spring water, and very healthy. The church, said to be the largest parish church in England, is of very mixed architecture, chiefly Transitional, Norman, and Early English; the nave and high chancel were judiciously restored in 1882, according to designs by the late Mr G. E. Street. Of the old fortifications there still remain portions of the town wall, much hidden by newer buildings, a strong quadrangular tower built by William of Ypres, earl of Kent, and lord warden in the time of Stephen, and now forming part of the police station, and a handsome gate with a round tower on each side, known as the Sandgate, at the entrance into Rye from the London road. Rye ceased in 1885 to be a parliamentary borough, but gives its name to the eastern division of the county. The population in 1881 was 4224.

Of the early history of Rye little is known. In the mediæval French chronicles it is always mentioned as "La Rie." Having been conferred upon the abbey of Fécamp by Edward the Confessor, it was taken back by King Henry III. into his own hands, "for the better defence of his realm," and received from that sovereign the full rights and privileges of a Cinque Port under the title of "Ancient Town." In consequence of the frequent incursions of the French, by whom it was sacked and burnt three times in the 14th century, it was fortified by order of Edward III. on the landward side, the steep precipitous sides of the rock affording ample protection towards the sea. In addition to the naval services rendered by Rye as a Cinque Port under the Plantagenet and Tudor sovereigns, it was a principal port of communication with France in times of peace,—for which reason successive bands of Huguenots fled thither between 1562 and 1685, many of whom settled at Rye and have left representatives now living.

RYEZHITZA, a town of European Russia at the head of a district in the Vitebsk government, in 56° 30' N. lat. and 27° 21' E. long., 198 miles north-west from Vitebsk on the railway between St Petersburg and Warsaw, near the Ryezhitza, which falls into Lake Luban. Its population increased from 7306 (2902 Jews) in 1867 to about 9000 in 1881; but its importance is mainly historical. The cathedral is a modern building (1846).

Ryezhitza, or, as it is called in the Livonian chronicles, Roziten, was founded in 1285 by Wilhelm von Harburg to keep in subjection the Lithuanians and Letts. The castle was continually the object of hostile attacks. In 1559 the Livonian order, exhausted by the war with Russia, gave it in pawn to Poland, and, though it was captured by the Russians in 1567 and 1577, and had its fortifications dismantled by the Swedes during the war of 1656–1660, it continued Polish till 1772, when White Russia was united with the Russian empire. In early times Ryezhitza was a large and beautiful town.

RYLAND, WILLIAM WYNNE (1738–1783), engraver, was born in London in July 1738, the son of an engraver and copper-plate printer. He studied under Ravenet, and in Paris under Boucher and J. P. le Bas. After spending five years on the Continent he returned to England, and having engraved portraits of George III. and Lord Bute after Ramsay (a commission declined by Strange), and a portrait of Queen Charlotte and the Princess Royal after Francis Cotes, R.A., he was appointed engraver to the king. In 1766 he became a member of the Incorporated Society of Artists, and he exhibited with them and in the Royal Academy. In his later life Ryland abandoned line-engraving, and introduced "chalk-engraving," in which the line is composed of stippled dots, a method by means of which he attained great excellence, and in which he transcribed Mortimer's King John Signing Magna Charta, and copied the drawings of the old masters and the works

of Angelica Kauffman. He traded largely in prints, but in consequence of his extravagant habits his affairs became involved; he was convicted of forging bills upon the East India Company, and, after attempting to commit suicide, was executed at Tyburn on the 29th of August 1783. A short memoir of Ryland was published the year after his death.

RYMER, THOMAS (1641–1713), historiographer royal, was the younger son of Ralph Rymer, lord of the manor of Brafferton in Yorkshire, described by Clarendon as "possessed of a good estate" and executed for his share in the "Presbyterian rising" of 1663. Thomas was probably born at Yafforth Hall early in 1641, and was educated at a private school kept by Thomas Smelt, a noted Royalist, with whom Rymer was "a great favourite," and "well known for his great critical skill in human learning, especially in poetry and history."¹

He was admitted as *pensionarius minor* at Sidney Sussex College, Cambridge, on April 29, 1658, but left the university without taking a degree. On May 2, 1666, he became a member of Gray's Inn, and was called to the bar on June 16, 1673. His first appearance in print was as translator of *Cicero's Prince* (1668), from the Latin treatise (1608) drawn up for Prince Henry. He also translated Rapin's *Reflections on Aristotle's Treatise of Poesie* (1674), and followed the principles there set forth in a tragedy in verse, licensed September 13, 1677, called *Edgar, or the English Monarch*, which was not, however, very successful. The printed editions of 1678, 1691, and 1693 belong to the same issue, with new title-pages. Rymer's views on the drama were again given to the world in the shape of a printed letter to Fleetwood Shephard, the friend of Prior, under the title of *The Tragedies of the Last Age Considered* (1678). To *Ovid's Epistles Translated by Several Hands* (1680), with preface by Dryden, "Penelope to Ulysses" was contributed by Rymer, who was also one of the "hands" who Englished the Plutarch of 1683–86. The life of Nicias fell to his share. He furnished a preface to Whitelocke's *Memorials of English Affairs* (1682), and wrote in 1681 *A General Draught and Prospect of the Government of Europe*, reprinted in 1689 and 1714 as *Of the Antiquity, Power, and Decay of Parliaments*, where, ignorant of his future dignity, the critic had the misfortune to observe, "You are not to expect truth from an historiographer royal." He contributed three pieces to the collection of *Poems to the Memory of Edmund Waller* (1688), afterwards reprinted in Dryden's *Miscellany Poems*, and is said to have written the Latin inscription on Waller's monument in Beaconsfield churchyard. He produced a congratulatory poem upon the arrival of Queen Mary in 1689. His next piece of authorship was to translate the sixth elegy of the third book of Ovid's *Tristia* for Dryden's *Miscellany Poems* (1692, p. 148). On the death of Thomas Shadwell in 1692 Rymer received the appointment of historiographer royal, at a yearly salary of £200. Immediately afterwards appeared his *Short View of Tragedy* (1693), criticizing Shakespeare and Ben Jonson, which produced *The Impartial Critick* (1693) of Dennis, the epigram of Dryden,² and the judgment of Macaulay that Rymer was "the worst critic that ever lived." Within eight months of his official appointment Rymer was directed (August 26, 1693) to carry

¹ See Hickes, *Memoirs of John Kettlewell*, 1718, pp. 10–14.

² "The corruption of a poet is the generation of a critic" (*Deed of the Third Miscellany*, in *Works*, 1821, xii. p. 49), which is much more pointed than Beaconsfield's reference to critics as "men who have failed in literature and art" (*Lothair*, chap. xxxv.) or Balzac's sly hit at Mérimée in similar terms. The poet's remarks on the *Tragedies of the Last Age* have been reprinted in his *Works*, 1821, xv. pp. 388–96, and in Johnson's *Life of Dryden*. See also Dryden's *Works*, i. 377, vi. 251, xi. 60, xiii. 20.

out that great national undertaking with which his name will always be honourably connected, and of which there is reason to believe that Lords Somers and Halifax were the original promoters. The *Codex Juris Gentium Diplomaticus* of Leibnitz was taken by the editor as the model of the *Fœdera*. The plan was to publish all records of alliances and other transactions in which England was concerned with foreign powers from 1101 to the time of publication, limiting the collection to original documents in the royal archives and the great national libraries. Unfortunately, this was not uniformly carried out, and the work contains some extracts from printed chronicles. From 1694 he corresponded with Leibnitz, by whom he was greatly influenced with respect to the plan and formation of the *Fœdera*. While collecting materials, Rymer unwisely engraved a spurious charter of King Malcolm, acknowledging that Scotland was held in homage from Edward the Confessor. When this came to be known, the Scottish antiquaries were extremely indignant. G. Redpath published a MS. on the independence of the Scottish crown, by Sir T. Craig, entitled *Scotland's Sovereignty Asserted* (1695), and the subject was referred to by Bishop Nicolson in his *Scottish Historical Library* (1702). This led Rymer to address three *Letters to the Bishop of Carlisle* (1702), explaining his action, and discussing other antiquarian matters. The first and second letters are usually found together; the third is extremely rare. Rymer had now been for some years working with great industry, but was constantly obliged to petition the crown for money to carry on the undertaking. Up to August 1698 he had expended £1253, and had only received £500 on account.

At last, on November 20, 1704, was issued the first folio volume of the *Fœdera*, *Conventiones, Litteræ et cujuscunque generis Acta Publica inter reges Angliæ et alios quosvis imperatores, reges, &c., ab A.D. 1101 ad nostra usque tempora habita aut tractata*. The publication proceeded with great rapidity, and fifteen volumes were brought out by Rymer in nine years. Two hundred and fifty copies were printed; but, as nearly all of them were presented to persons of distinction, the work soon became so scarce that it was priced by booksellers at one hundred guineas. A hundred and twenty sheets of the fifteenth volume and the copy for the remainder were burnt at a fire at William Bowyer's, the printer, on January 30, 1712-13. Rymer died shortly after the appearance of this volume, but he had prepared materials for carrying the work down to the end of the reign of James I. These were placed in the hands of Robert Sanderson, his assistant. For the greater part of his life Rymer derived his chief subsistence from a mortgage assigned to him by his father. His miscellaneous literary work could not have been very profitable. At one time he was reduced to offer his MSS. for a new edition for sale to the earl of Oxford. About 1703 his affairs became more settled, and he afterwards regularly received his salary as historiographer, besides an additional £200 a year as editor of the *Fœdera*. Twenty-five copies of each volume were also allotted to him. He died at Arundel Street, Strand, December 14, 1713, and was buried in the church of St Clement Danes. His will was dated July 10, 1713. Tonson issued an edition of Rochester's *Works* (1714), with a short preface by the late historiographer. Another posthumous publication was in a miscellaneous collection called *Curious Amusements*, by M. B. (1714), which included "some translations from Greek, Latin, and Italian poets, by T. Rymer." Some of his poetical pieces were also inserted in J. Nichols's *Select Collection* (1780-86, 8 vols.).

Two more volumes of the *Fœdera* were issued by Sanderson in 1715 and 1717, and the last three volumes (xviii., xix., and xx.) by

the same editor, but upon a slightly different plan, in 1726-35. The latter volumes were published by Tonson, all the former by Churchill. Under Rymer it was carried down to 1586, and continued by Sanderson to 1654. The rarity and importance of the work induced Tonson to obtain a licence for a second edition, and George Holmes, deputy keeper of the Tower records, was appointed editor. The new edition appeared between 1727 and 1735. The last three volumes are the same in both issues. There are some corrections, enumerated in a volume, *The Emendations in the new edition of Mr Rymer's Fœdera*, printed by Tonson in 1730, but in other respects the second is inferior to the first edition. A third edition, embodying Holmes's collation, was commenced at The Hague in 1737 and finished in 1745. It is in smaller type than the others, and is compressed within ten folio volumes. The arrangement is rather more convenient; there is some additional matter; the index is better; and on the whole it is to be preferred to either of the previous editions. When the volumes of the *Fœdera* first appeared they were analysed by Leclerc and Rapin in the *Bibliothèque Choisie* and *Bibliothèque Ancienne et Moderne*. Rapin's articles were collected together, and appended, under the title of *Abregé historique des actes publics de l'Angleterre*, to the Hague edition. A translation, called *Acta Regia*, was published by Stephen Whatley, 1726-7, 4 vols. 8vo, reprinted both in 8vo and folio, the latter edition containing an analysis of the cancelled sheets, relating to the journals of the first Parliament of Charles I., of the 18th volume of the *Fœdera*.

In 1808 the Record Commissioners appointed Dr Adam Clarke to prepare a new and improved edition of the *Fœdera*. Six parts, large folio, edited by Clarke, Caley, and Holbrooke, were published between 1816 and 1830. Considerable additions were made, but the editing was performed in so unsatisfactory a manner that the publication was suspended in the middle of printing a seventh part. The latter portion, bringing the work down to 1833, was ultimately issued in 1869.

The wide learning and untiring labours of Rymer have received the warmest praise from historians. Sir T. D. Hardy styles the *Fœdera* "a work of which this nation has every reason to be proud, for with all its blemishes—and what work is faultless?—it has no rival in its class" (*Syllabus*, vol. ii., xxxvi.), and Mr J. B. Mullinger calls it "a collection of the highest value and authority" (Gardiner and Mullinger's *Introduction to English History*, p. 224).

The best account of Rymer is to be found in the prefaces to Sir T. D. Hardy's *Syllabus*, 1869-86, 3 vols. 8vo. There is an unpublished life by Des Malzeaux (Brit. Mus. Add. MS. No. 4223), and a few memoranda in Bishop Kennet's collections (Lansd. MS. No. 987). In Caulfield's *Portraits*, &c., 1819, i. 50, may be seen an engraving of Rymer, with a description of a satirical print. Rymer's two critical works on the drama are discussed by Sir T. N. Talfourd in the *Retrospective Review*, 1820, vol. i. p. 1-15.

Sir T. D. Hardy's *Syllabus* gives in English a condensed notice of each instrument in the several editions of the *Fœdera*, arranged in chronological order. The third volume contains a complete index of names and places, with a catalogue of the volumes of transcripts collected for the Record edition of the *Fœdera*. In 1869 the Record Office printed, for private distribution, Appendices A to E "to a report on the *Fœdera* intended to have been submitted by C. Purton Cooper to the Late Commissioners of Public Records," 3 vols. 8vo (including accounts of MSS. in foreign archives relating to Great Britain, with facsimiles). In the British Museum is preserved (Add. MS. 24,699) a folio volume of reports and papers relating to the Record edition. Rymer left extensive materials for a new edition of the *Fœdera*, bound in 59 vols. folio, and embracing the period from 1115 to 1698. This was the collection offered to the earl of Oxford. It was purchased by the Treasury for £215 and is now in the British Museum (Add. MSS. Nos. 4578 to 4630, and 18,911). A catalogue and index may be consulted in the 17th volume of Tonson's edition of the *Fœdera*. The Public Record Office possesses a MS. volume, compiled by Robert Lemon about 1800, containing instruments in the Patent Rolls omitted by Rymer. In the same place may be seen a volume of reports, orders, &c., on the *Fœdera*, 1608-11. (H. R. T.)

RZHEFF, RSHEFF, RJEV, or RZHOFF, a town of European Russia at the head of a district in the Tver government, in 56° 16' N. lat. and 34° 21' E. long., 89 miles south-west of Tver, occupies the bluffs on both banks of the Volga (here 350 feet wide) near the confluence of the river Bazuza. It is the terminus of a branch line from the St Petersburg and Moscow Railway, has a population of 18,569 (1880; 19,660 in 1866), carries on a variety of manufactures—hemp-spinning, malting, brewing, ship-building, &c.—and is the centre of a great transit trade between the provinces of the lower Volga, Orel, Kaluga, and Smolensk, and the ports of St Petersburg and Riga.

Rzheff was already in existence in the 12th century, when it belonged to the principality of Smolensk and stood on the highway between Novgorod and Kieff. Under the rulers of Novgorod it became from 1225 a subordinate principality, and in the 15th century the two portions of the town were held by two independent princes, whose names are still preserved in the designations Knyaz Fedorovskii and Knyaz Dimitrievskii, given respectively to the left and the right bank of the Volga. In 1868 Rzheff was captured by Vladimir Andreevitch, and in 1875 it stood a three weeks' siege and had its suburb burned by the same prince. It was made a district town in 1775.

S

S represents the hard open (or fricative) sound produced by bringing the blade of the tongue close to the front palate, immediately behind the gums, or rather, this is the normal position for S, as slight varieties can be produced by bringing the tongue farther back. By the "blade" is meant the pointed end of the tongue, not the mere point, which at the same part of the palate produces R. This position differs little from that for TH, into which S passes in a lisping pronunciation; a larger part of the surface of the tongue is brought near to the palate for TH than for S. The symbol which represents the soft open sound corresponding to S is Z, though in practice S often stands for both.

The history of our symbol S is easy up to a certain point. It is the rounded form of Σ , rounded at a very early period for convenience of writing, for the change is apparent in the old Italian alphabet of Cære, and still more on the recently discovered vase of Formello; and even in the scribbling of the Greeks at Abu Simbel—the oldest, or nearly the oldest, bit of Greek epigraphy—perfectly rounded forms stand side by side with the angular ones. The common Greek form Σ was obtained by adding a fourth stroke, and gradually making the top and bottom ones horizontal. When, however, we wish to identify the Greek symbol of three strokes with its Phœnician counterpart, the difficulty begins. The Phœnicians had four symbols for sibilants, known in Hebrew as Zayin, Samekh, Šade, and Shin; the last of these at a very early date represented two sounds, the English *sh*, and another sound which resembled that of Samekh and ultimately became indistinguishable from it, both being pronounced as the English *s*. The Greeks did not want all these symbols, consequently in different parts of Greece one or other—not the same—Phœnician symbol fell into disuse. One of these, **M** or **N**, called San, though lost in Ionic, appears in old Doric inscriptions, as those of Thera, Melos, and Crete, Argos, Corinth, and Corcyra; but the later Doric form is the usual Sigma; probably San was too like the nasal M. There is no doubt that in form Zeta represents Zayin, and that Xi represents Samekh. Moreover, Zeta and Zayin stand seventh in the Greek and Phœnician alphabets respectively, and Xi and Samekh each fifteenth. Again, the form of San with three strokes corresponds fairly with Šade, and Sigma is moderately like Shin; but here the evidence of position comes in again to strengthen a somewhat weak case, for in the old Italian alphabets San has the place of Šade, the simpler form occurring in the Cære alphabet, the fuller in that of the Formello vase; in both Sigma (rounded in form) has the place of Shin. These identifications would be certain if the names corresponded as well as the forms; but they clearly do not: Zeta and Šade (not Zayin) seem to hold together in sound, and Sigma (as has often been suggested) looks like a "popular etymology" for Samekh. But the objection from difference of names is not fatal. All names which are thought of habitually in rows or sets tend to be modified under the influence of analogy; and analogy has certainly been at work here, for Xi, which is a purely Greek name, is, like Psi, and like Chi and Phi, due to the older Pi. Similarly Eta and Theta have probably made Zeta; but it must be allowed that the metamorphosis of Šade is more intelligible (as a matter of sound-change) than that of Zayin. Probably we must have recourse to a different principle to explain at least some part of our difficulty. We may suppose that in some part of Greece the sounds

denoted originally by Šade and Zayin became indistinguishable; there would then exist for a time one sound but two names. It would be a matter of little moment which name should survive; thus Šade (or Zeta) might supersede Zayin, or one name might survive in one district—as San in the Doric, but Sigma in the rest of Greece. This suggestion is made by Dr Taylor (*The Alphabet*, ii. 100). The history of the sounds, as well as of the forms, of the Greek sibilants is difficult. Probably Sigma was generally hard—our *s* in *sign*. But Zeta did not originally denote the corresponding *z*: rather it was *dz*; some say *dj*, as in "John," but this is not likely. Xi was probably a strong sibilant with a weak guttural, as X was in Latin. If the sound *z* existed in Greek, as is probable, it was denoted by Sigma. In Italy, also, we must infer that the soft sibilant was heard too little to need a special symbol, because *z*, which exists in the old alphabets of Cære and Formello, was lost early enough to leave a place for the newly-made Italian symbol G. When Z was restored, it was placed at the end of the alphabet and doubtless with the value of Greek Z in the Greek words in which alone it was used. One Latin *s*—probably *z*—became the trilled *r* between two vowels,—e.g., in "Papius" for "Papisius," "arboris" for "arbosis."

In English the symbol *s* alone existed till *z* was introduced from France with words of French origin, as "zeal," "zone." An attempt was made to employ it at the end of plural nouns, where the sound is regularly heard except when the last sound of the noun is hard, e.g., "bedz" (beds), but "hops"; but this was not maintained, nor even consistently done, for the symbol was used even when the sound must have been *s*. We regularly write *s* for both sounds,—e.g., in "lose" and "loose," "curs" and "curse," "hers" and "hearse." When there is a distinction in spelling the *s* commonly has the value of *z*,—e.g., "vies" and "vice," "pays" and "pace," "his" and "hiss." S has the sound of *sh* in "sure," "sugar," and some other words; this is due to the palatal sound heard before the *u*. *Sh*, in spite of its spelling, is a single sound, the position of which differs from that for *s* only in a slight retraction of the point of the tongue; it is commonly found in English words which originally had *sk*,—e.g., "shall," O.E. *sceal*; "shabby," a doublet of "scabby"; "fish," O.E. *fisk*. The sound is the same as that of French *ch* in "château," "chef," "sécher," where it is due to assimilation of original *k* SAADI. See SA'DÍ.

SAADIA, or SAADIAS (Heb. *Se'adyah*, Arab. *Sa'id*¹), was the most accomplished, learned, and noble gaon (head of the academy) of Sūrā (see RAB). Mar Rab Se'adyah b. Yoseph² was born in the Fayyūm, Upper Egypt, in 892 and died at Sūrā in 942. Of his teachers only the Jew Abū Kethīr is positively known by name,³ but he must have had at least three more teachers of considerable learning, one a Karaite,⁴ one a Mohammedan, and one a Christian, as his acquaintance with the literature of these four religious bodies testifies. His pre-eminence over his

¹ He signs himself **דע** acrostically in his *Azharoth* (*Kobes*, pp. 52, 53; see note 4 on next page).

² Mas'ūdi, a contemporary, calls the father Ya'aqob; but see Fürst, *Literaturblatt d. Orient*, vi. col. 140.

³ Mas'ūdi (*De Sacy*, *Chrest. Ar.*, 2d ed., i. 350, 351).

⁴ The late learned and ingenious Rabbi S. L. Rapoport rolled here, as in many other places, the stone of Sisyphus ("Toledoth Rabbenu Se'adyah Gaon," in *Bikkure Ha'ittim*, Vienna, 1828, note 31). Perhaps, after all, the Karaites may be right in asserting that Salmon b. Yeruhām was Rab Se'adyah's teacher.

contemporaries is indicated in the fact that he was the only gaon who had not been educated and then advanced by degrees in the academy, to the highest dignity of which he was called from a far-off country, but best appears in the excellence of his many works, which extend over most branches of learning known in his time. And his learning was exceeded by his manifold virtues. His love of truth and justice was made more conspicuous by the darkness of the corruption amid which he lived. When the *rēsh gāluthā* ("prince of the captivity," the highest dignitary of the Jews in Babylonia, and to some extent of those of the whole world) attempted to wrest judgment in a certain case, and first asked, then requested, and finally demanded the signature¹ of the gaon of Sūrā in a threatening manner, Se'adyah refused it, fearless of consequences. David b. Zakkai, the *rēsh gāluthā*, deposed him and chose another gaon in his stead. A reconciliation took place some years afterwards, and Se'adyah was reinstated in his old dignity. And, although his health had been fatally undermined by the behaviour of the *rēsh gāluthā* and his son, Se'adyah, when his former opponent died, was indefatigable in his endeavours to have this very son of his once mortal enemy placed on the throne of his fathers. But the new prince of the captivity enjoyed his dignity for little more than half a year. He left behind him a boy, twelve years of age, whom Se'adyah took into his own house and treated in every respect as his own child. This learning and these virtues endeared Se'adyah not merely to his contemporaries but also to the best men of succeeding ages. Behayye b. Yoseph (the author of the *Hoboth Hallebaboth*), Rashi, Se'adyah (the author of the commentary on Daniel in the Rabbinic Bible), David Kimhi, Behayye b. Asher (the author of *Kad Hakkemah*), all appeal to him as an authority not to be questioned. Even Ibn 'Ezra defers more to him than to any other authority. To this day Jewish and Christian scholars alike express for him the highest admiration.

The numerous works which are ascribed to him may be conveniently divided into four classes.

I. *Genuine and still extant Works*.—(1) Arabic translations of, and in part commentaries² on, books of the Bible: (a) the Pentateuch (printed in Hebrew characters, Constantinople, 1546, fol., and in Arabic characters in the Paris and London polyglots); (b) Isaiah (printed in Arabic characters from Hebrew letters of the Bodleian MS. Uri 156,³ by Paulus, Jena, 1790-91, 8vo); (c) Psalms (Ewald, *Ueber die arabisch geschriebenen Werke jüdischer Sprachgelehrten*, Stuttgart, 1844, 8vo); (d) Proverbs (Bodleian MS. Uri 15); (e) Job (Uri 45); (f) Canticles (Merx, *Die Saadjanische Uebersetzung des Hohen Liedes ins Arabische*, Heidelberg, 1882, 8vo). (2) Hebrew Lexicography: Seventy (90 or 91) ἀπαξ λεγόμενα to be found in the Bible, published from the Bodl. MS. Hunt. 573, by Dukes (*Z. K. M.*, v. 6) and by Benjacob (*Debarim Atikim*, i., Leipsic, 1844). (3) Talmudic Literature: (a) Decisions (incorporated in *Itur*, Venice, 1608, fol.; and in the book of *Responsa*, *Sha'are Sedek*, Salonica, 1792, 4to); (b) On the laws of inheritance (Bodl. MS. Hunt. 630). (4) Liturgy, both in prose and poetry: (a) *Siddur* (Bodleian MS. Uri 261);⁴ (b) *Arabischer Midrasch* (!)

¹ To make the legal decisions of the *rēsh gāluthā* more respected, the signatures of the geonim of Sūrā and Pumbedithā were desirable. A specimen of a legal decision by David b. Zakkai signed on the authority of Rab Se'adyah Gaon is to be found in Frankel-Grätz, *Monatsschrift*, xxxi. pp. 167-170.

² If we may argue from the known to the unknown, Se'adyah's translations, whether they were called *tafsir* or *sharh*, contained more than a mere translation. From Ibn 'Ezra's preface to his commentary on the Pentateuch and from the Arabic comm. on the Psalms published in excerpt by Ewald we see that Rab Se'adyah was in the habit of explaining in addition to translating. Compare also Munk, "Notice sur Saadia," in Cahen, *La Bible* (Isaïe), Paris, 1838, 8vo, p. 77, note 1.

³ In the copyist's subscription to this MS. the actual reading is not עבארה (Rapoport), but עבארה; this should be עבארה, as Munk prints it ("Notice," p. 108). The Bodleian MSS. are referred to in this article from personal inspection.

⁴ The original codex on brownish paper, in square characters of Babylonia handwriting (14th cent.), is defective at beginning and end. The supplement at the beginning, containing also later matter,

zu den Zehn Geboten, in Hebrew letters (MS. Jellinek of Vienna, with Hebrew and German translation by W. Eisenstädter, Vienna, 1868, 8vo). (5) Religious Philosophy: (a) Commentary on the *Sepher Yesirah*, MS. Uri 370 (*Opp. Add.*, 4to, 89), contains the earlier part of a Heb. trans. in a modern hand; (b) *Kitāb al-Amūdāt wa'l-I'tiqādāt* (Landauer, Leyden, 1880, 8vo), translated into Hebrew by Yehudah Ibn Tibbon (*editio princeps*, Constantinople, 1562, 4to), and by R. Berekhyah Hannakdan, author of the *Mishle Shu'alim* (printed only in part; see Dukes, *Beiträge*, pp. 20, 22); nine chapters have been translated into German (Fürst, Leipsic, 1845, 12mo), and parts into English (*Two Treatises*, by F. Allix, London, 1707, 8vo).

II. *Works now lost, but the existence of which is testified to by contemporary and later authors*.—(1) An Arabic translation of, and in part commentary on, most, if not all, the other books of the Bible.⁵ (2) Lexical Treatises: Book of Interpretations (*Sepher Pithronim*, or Collection (*Iggeron*)).⁶ (3) Grammatical Treatises: (a) Elegancy of the Hebrew Tongue—(a) Treatise on the Changes, (β) Treatise on the Combinations, (γ) Treatise on *Dagesh* and *Raphah*, (δ) Treatise on the Letters י, ו, פ, א; (b) Treatise on Punctuation⁸; (c) Treatise on Right Reading⁹;—it is not impossible that the first four constituted one work and the last two another work. (4) Talmudic Literature: (a) Translation of the *Mishnah*¹⁰; (b) Methodology of the (Babylonian) Talmud¹¹; (c) Treatise on Bills¹²; (d) Treatise on Deposits¹³; (e) Treatise on Oaths¹⁴; (f) Treatise on Prohibited Degrees¹⁵; (g) Treatise on *Impura et Pura*, including *Hilekhot Niddah*¹⁶;—it is very possible that those marked c to f constituted one book, just as the treatise marked g constituted one book. (5) Calendaric Literature: *Sepher Ha'ibbur* (Treatise on Intercalation).¹⁷ (6) Apologetics: Treatise on Investigations.¹⁸ (7) Polemics: (a) against Karaism—(a) 'Anan,¹⁹ (β) Ibn Sakkawiyah,²⁰ (γ) Ibn Zitta (or Zutta)²¹; (b) against the Rabbanite Hivvi al-Balkhi²²; (c) against the Karaite Ben Asher (the completer of the *Massoreth*; see *L.-B. d. Or.*, x. 684). (8) The nature of the *Sepher Haggalut* cited by Rabad II. and Ab. b. Hiyya in his *Sepher Ha'ibbur* is not clear.

III. *Works ascribed to Se'adyah the authorship of which is not sufficiently proven*.—(1) The commentary on Canticles edited by Yishak Ibn 'Akriah (Constantinople, 1577, 4to), and that published by L. Margaliyyoth at Frankfort-on-Oder, 1777.²³ (2) The well-known piece of didactic poetry which gives account of all the letters of the Bible, how many times they occur, &c. (*editio princeps*, Venice, 1538, at the end of Elias Levita's *Massoreth Hammass.*).

IV. *Works ascribed to Se'adyah by mistake*.—(1) The Commentary on Daniel commonly found in the Rabbinic Bibles belongs to another Rab Se'adyah, who lived at least two hundred years later, and was a native either of France or the south of Germany. (2) The Commentary on the *Sepher Yesirah*, printed with the text and three other commentaries at Mantua in 1562, 4to. (3) The Book on Lots (*Sepher Haggoraloth*), often printed separately and in conjunction with similar works. (4) *Eben Happhilosophim* (*Lapis Philosophorum*), ascribed to him by R. Mosheh Butrial (Mantua edition of the *Sepher Yesirah* as above). (S. M. S.-S.)

is in S. Arabian handwriting. The well-known "Ten reasons for Sounding the Trumpet on the Day of Memorial" are not found in this *Siddur* (against Rapoport, *ut supra*, note 21). The three poetical pieces published as five by Rosenberg (*Kobez*, ii., Berlin, 1856) form an integral part of the *Siddur*, but bear on the surface marks of having been taken from a second-hand, if not a third-hand, copy, as the editor admits with regard to the "second petition." The "Two Petitions" must have served Ibn Gebirol (AVICEBRON) as a model for the latter or liturgical part of his *כתר מלכות*, just as he and others after him silently utilized Se'adyah's philosophy.

had raised strong objections against the truth of Scripture in his *Two*

Hundred Questions, or Objections to the Bible.

²⁰ The editions "Prag", 1782 (Steinschneider), and Nowydwor, 1783

(Zedner), are probably the same as that of Frankfort with different titles.

SAALFELD, a busy little town of Germany, in the eastern horn of the crescent-shaped duchy of Saxe-Meiningen, is picturesquely situated on the left bank of the Saale (here spanned by a bridge), 24 miles south of Weimar and 77 miles south-west of Leipsic. One of the most ancient towns in Thuringia, Saalfeld was the capital of the now extinct duchy of Saxe-Saalfeld, and contains some interesting old buildings. Among these are the former residential palace, built in 1679 on the site of the Benedictine monastery of St Peter, destroyed during the Peasants' War; the Gothic church of St John, dating from the 13th century; the quaint town-house, built in 1533-37; and the Kitzerstein, a shooting-lodge said to have been originally erected by the emperor Henry I., though the present building is not older than the 16th century. But perhaps the most interesting relic of the past in Saalfeld is the striking ruin of the Sorbenburg or Hoher Schwarm, a strong castle said to have been built by Charlemagne to protect his borders from the Slavonic hordes. Its destruction took place in 1290, under Rudolf of Hapsburg. Saalfeld is situated in one of the busiest parts of Meiningen, and carries on a number of brisk industries, including the manufacture of sewing-machines, colours, wax-cloth and wire-cloth, brewing, and iron-founding. It has an active trade in iron, slate, wood, and wooden goods, and there are ochre and iron mines in the neighbourhood. The population in 1880 was 7458.

Springing up under the wing of the Sorbenburg, Saalfeld early became an imperial demesne, and received various benefits at the hands of successive emperors. After a somewhat chequered career, the town became the capital of the duchy of Saxe-Saalfeld, founded in 1680 by the youngest son of the duke of Gotha; but in 1735, when the succession to the duchy of Coburg was assigned to the dukes of Saalfeld, their residence was removed to Coburg. In 1826 the united duchies merged by inheritance in the duchy of Saxe-Meiningen.

SAARBRÜCKEN, an important industrial and commercial town in Prussia, on the left bank of the Saar, a navigable tributary of the Moselle, is situated 49 miles east of Metz, at the south end of one of the most extensive coal-fields in Europe, to which it has given its name. With the town of St Johann, immediately opposite on the right bank of the river, here spanned by two bridges, Saarbrücken forms in reality a single community, with a united population of nearly 22,000. St Johann, though now the larger, is the more recent town, being in fact the creation of the important railways whose junction is fixed there. Saarbrücken itself is not directly on any main line. The industries of St Johann-Saarbrücken include wool-spinning, brewing, and the manufacture of tobacco, chemicals, tin, and stoneware. The trade is chiefly connected with the produce of the neighbouring coal-mines and that of the numerous important iron and glass works of the district. The Saarbrücken coal-field extends over 70 square miles; and its annual output is about 6 million tons. Of this total the Prussian state mines yield about 5,200,000 tons, Prussian private mines 100,000 tons, the mines in Lorraine 500,000 tons, and mines in Rhenish Bavaria 200,000 tons. In 1880 the population of Saarbrücken alone was 9514, and of St Johann 12,346.

Till 1283 Saarbrücken was in the possession of the old counts of Ardennes; from 1381 till 1793 it was the residence of the princes of Nassau-Saarbrücken; from 1793 till 1815 it was in the possession of the French; and since 1815 it has been Prussian. St Johann is said to have been founded as an outwork to Saarbrücken in 1046, and to have received town-rights in 1321. In the Franco-Prussian War of 1870-71 Saarbrücken was seized by the French on 2d August 1870, but the first German victory, on the heights of Spicheren, 3 miles to the south, relieved it four days later.

SAARDAM. See ZAANDAM.

SAARGEMÜND (Fr. *Sarregrumines*), an industrial town and railway junction of Germany, in the imperial province of Alsace-Lorraine, is situated at the confluence

of the Blies and the Saar, 40 miles east of Metz. It carries on considerable manufactures of silk, plush, porcelain, and earthenware, and is a chief depôt for the papier-maché boxes (mostly snuff-boxes) which are made in great quantity in the neighbourhood. To the south lies the district lunatic asylum of Steinbacherhof. The town, which is garrisoned by four squadrons of cavalry, in 1880 had a population of 9573, chiefly Roman Catholics.

SAAVEDRA, ANGEL DE, DUKE OF RIVAS (1791-1865), Spanish poet and politician, was born at Cordova in 1791, and fought with bravery in the Spanish War of Independence. From 1813 to 1820 he lived in retirement in Andalusia, but in the latter year he sided actively with the revolutionary party, and in consequence had to go into exile in 1823. He lived successively in England, Malta, and France until 1834, when he received permission to return to Spain, shortly afterwards succeeding his brother as duke of Rivas. In 1836 he became minister of the interior under Isturiz, and along with his chief had again to leave the country. Having returned with Maria Christina in 1844, he again held a portfolio for a short time in 1854; and during the last two decades of his life he was ambassador at Naples, Paris, and Florence for considerable periods. He died in 1865.

In 1813 he published *Ensayos poeticos*, and between that date and his first exile several tragedies of his composition (*Alfaro*, 1814; *El Duque d'Aquitania*, 1814; *Lamusa*, 1822) were put upon the stage. *Tanto vales quanto tienes*, a comedy, appeared in 1834, *Don Alvaro*, a tragedy, in 1835, and two other dramatic compositions in 1842. Saavedra was also the author of *El Moro Exposito*, a narrative poem in ballad metre (two volumes), and *Florinda*, an epic romance.

SAAVEDRA, MIGUEL DE CERVANTES. See CERVANTES.

SAAVEDRA FAXARDO, DIEGO DE (1584-1648), diplomatist and man of letters, was born of a noble family at Algezares in the Spanish province of Murcia in 1584. Having been educated for the church at Salamanca, and admitted to the priesthood, he accompanied Cardinal Borgia, the Spanish ambassador, to Rome in the capacity of secretary. Ultimately he rose to high rank in the diplomatic service, and was Spanish plenipotentiary at Ratisbon in 1636 and at Münster in 1645. He was nominated to the supreme council of the Indies in 1646, but not long afterwards retired to a monastery, where he died in 1648.

In 1640 he published a treatise entitled *Empresas politicas, o idea de un principe politico cristiano representado en cien empresas*, a hundred short essays, in which he discusses the education of a prince, his relation and duties to those around him, and so forth, primarily intended for and dedicated to the son of Philip IV. It is sententious in style and characterized by the curious learning of the time, and is still read and admired in Spain. It passed through a number of editions and was translated into several languages, the English version being by Asty (2 vols., 8vo, London, 1700). An unfinished historical work entitled *Corona Gotica, Castellana, y Austriaca politicamente ilustrada*, appeared in 1646. Another work by Saavedra, only second in popularity to the *Empresas*, his *Republica Literaria*, was published posthumously in 1670; it discusses in a somewhat mocking tone some of the leading characters in the ancient and modern world of letters. Collected editions of his works appeared at Antwerp in 1677-78, and again at Madrid in 1789-90; see also vol. xxv. of the *Bibl. de Aut. Esp.* (1853).

SAAZ (Bohemian *Žatec*), a manufacturing and commercial town in the north of Bohemia, is situated on the right bank of the Eger, 42 miles north-west of Prague. The suspension bridge, 210 feet long, which here spans the river was constructed in 1826 and is one of the oldest of the kind in Bohemia. Saz, which claims to have existed as early as the 8th century, contains a number of ancient churches, of which one is said to date from 1206, and five others from before the close of the 14th century. The town-house was built in 1559. A technical school was added in 1878 to the already fairly numerous educational institutions. Nails, leather, beetroot-sugar, and pasteboard are among the chief manufactures of Saz,

which, however, owes its main importance to being the centre of the extensive hop-trade of the neighbourhood. The hops of Saaz are said to have been renowned for the last five hundred years; and nearly 800 tons are annually raised in the district to which the town gives its name. The population of Saaz was 12,425 in 1880.

SABÆA. See YEMEN.

SABAH, or BRITISH NORTH BORNEO, is all that portion of the island of BORNEO (*q.v.*) which was formally recognized by the charter of incorporation granted in November 1881 as the territory of the British North Borneo Company. It has a coast-line of over 600 miles, and its area, still to a great extent unexplored,¹ is estimated at 30,000 square miles. Leaving out of account the deep indentations of the coast-line, it may be said to form a pentagon, of which three sides, the north-west, north-east, and south-east, are washed by the sea, while the remaining two sides are purely conventional lines drawn from Gura Peak (3° 50' N. lat., 116° 10' E. long.), the one almost due east to the Sibucu river, the other north-north-west to the mouth of the Sipitong on Brunei Bay. The latter separates the Company's territory from the independent sultanate of Brunei; the former is the frontier towards the Dutch possessions.

The great central feature of Sabah is the magnificent mountain of Kinabalu (compare BORNEO) or Nabalu, built up of porphyritic granite and igneous rocks to a height of 13,698 feet, and dominating the whole northern part of the island, with all its profusion of lesser mountains and hills. Kinabalu, which has the appearance of two mountains, unites towards the east by a low ridge with "Nonohan t' agaioh (the great Nonohan) and the terminal cone Tumboyonkon (Tamboyukon)." These two summits are respectively 8000 and 7000 feet high, and there are others of considerable elevation in the same neighbourhood. At some 15 or 20 miles to the north rises Mount Madalon (5000 feet), separated from Kinabalu and the other igneous and metamorphic hills by a wide valley, and consisting of those aqueous rocks, limestones, sandstones, and clays which appear to occupy the whole country to the north. Westward from Kinabalu are hills between 1000 and 2000 feet in height, and about 40 or 50 miles south-east is an important group on the north side of the Labuk valley known as the Mentapok Mountains (3000-8000 feet). The whole surface of the country is channelled by countless streams whose precipitous ravines, boulder-strewn rapids, and enormous beds of rolled pebbles bespeak the denuding energy of tropical rains. The coasts are generally low and flat, and to a great extent lined with casuarina trees, with here and there a stretch of mangrove, a low sandstone or limestone cliff, or a patch of that great forest which in the interior still covers so large a portion of the territory. In the low grounds along the coast and also inland among the hills are vast swamps and watery plains, which in the rainy season, when the rivers rise 20 or 30 feet above their usual level, are transformed into lakes. On the west side of Sabah the principal rivers are the Padas and the Klias, debouching opposite Labuan, but quite unexplored in their upper courses; the Papar (Pappar or Pappal), which passes the village of that name and enters the sea at Papar Point; the Tampassuk, one of the first to be explored (see St John's *Life in the Forests of the Far East*) and remarkable for the waterfall of Pandassan or Tampassuk (1500 feet high, and thus one of the highest in the world), formed by its headwater the Kalupis. The Sekwafi, a comparatively small river

farther north, is well known for its oil-springs. At the northern extremity of the island the deep inlet of Marudu Bay receives the waters of the Marudu or Maludu river, which rises on the west side of Mount Madalon. On the east coast are the Sugut, which has its headwaters in the hills to the east of Kinabalu, and forms its delta in the neighbourhood of Torongohok or Purpura Island; the Labuk, debouching in Labuk Bay, and having its sources in the highlands about 70 miles inland; the Kinabatangan, with a longer course than any yet mentioned, rising probably between 116° and 117° E. long., and forming at its mouth a very extensive delta to the south of Sandakan Harbour; and finally the Segama, the scene of Frank Hatton's death (1883). Farther south, and inland from Darvel Bay and Sibucu (or St Lucia) Bay, there are no doubt other rivers of equal, it may be superior, importance; such, to judge by its delta, is the Kalabakong, debouching opposite Sebattik Island. Most of the rivers mentioned are navigable for steam launches of light draught, but their value is frequently impaired by a bar near the mouth. Several of the natural harbours of North Borneo, on the other hand, are at once accessible, safe, and commodious. Sandakan Harbour, on the north-east coast (5° 40' N. lat. and 118° 10' E. long.), runs inland some 17 miles, with a very irregular outline broken by the mouths of numerous creeks and streams. The mouth, only 2½ miles across, is split into two channels by the little island of Balhalla. The depth in the main entrance varies from 10 to 17 fathoms, and vessels drawing 20 feet can advance half-way up the bay. Just within the mouth, on the north side, lies Elopura (see below). At Silam, on Darvel Bay, farther south, there is good anchorage. Kudat (discovered by Commander Johnstone, of H.M.S. "Egeria," in 1881) is a small but valuable harbour in Marudu Bay running inland for 2 or 3 miles, but rapidly shoaling after the first mile to 1 and 2 fathoms. It affords anchorage for vessels of any draught, but the frontage available for wharves is limited to some 1500 feet. In Gaya Bay, on the west coast, any number of vessels may lie in safety during either monsoon, the depths varying from 6 to 16 and 17 fathoms.

The climate of North Borneo is of course tropical, with a very equable temperature. The lowest minimum of the thermometer recorded in 1883 at Sandakan was 68°·5 in December. The greatest interval without rain was eight days in March. The rainfall was 34½ inches (157 in 1880) at Sandakan, 129 at Papar, and 120 at Kudat. In the interior it must often be much above these figures.

That North Borneo should prove rich in minerals was supposed probable from the character of some other parts of the island; but hitherto investigations have not in this matter proved very successful. Coal or lignite exists, but most frequently in thin seams and insignificant pockets; the petroleum springs cannot come into any true competition with those worked elsewhere; gold has been discovered (1885) in the Segama river and may prove a stimulus to immigration; iron-ores appear both abundant and at times productive; and there are indications of the existence of copper, antimony, tin, and zinc ores. As yet the wealth of the country lies in its timber and jungle products (camphor and gutta-percha in great quantities), and in its edible nuts, guano, sago, sugar, tobacco, coffee, pepper, and gambier. Tobacco is most successfully grown by the natives in the inland districts of Mansalut, Kandassang, Koporingan, Gana-Gana, Tomborongo, Karnahan, Penusak, Tlong-Tuhan, &c.; and its cultivation has been taken up by several foreign companies. The birds'-nest caves of Gomanton (Gormanton) near the village of Malape on the Kinabatangan yield the Government a revenue of from \$6000 to \$7000; and other caves of the same kind are still unworked. As the natives (Dusuns, Tagaas-Bajaus, Idaan, &c.) are scattered, mostly in small villages, throughout the unexplored as well as the explored districts, their number can only be guessed, but it is usually stated at 150,000. Since the formation of the company there has been a steady immigration, especially of Chinese from Singapore. At Elopura, the capital of the territory and of its East Coast residency, the inhabitants in 1883 numbered 3770 (1500 being Chinese and 1085 Sulus). Hong-Kong and Singapore steamers now call regularly at Sandakan, Gaya, and Kudat. In 1885 the territory was divided into Alcock province (in the north), Keppel province (along the west coast as far north as

¹ But the officers of the company are very active in exploration. L. B. von Donop, F. Witt (killed 1882), W. B. Pryer, Frank Hatton (killed 1888), and Henry Walker are or have been among the more energetic.

Kimanis Bay), the East Coast residency (to the south-east of Alcock and Keppel provinces), and Dent province (to the south-west of the East Coast residency with the coast from Kimanis Bay to Brunei Bay).

In 1865 an American company started by Mr Torrey obtained from the sultan of Brunei certain concessions of territory in North Borneo; but this enterprise proved a financial failure and the settlement formed on the Kimanis river broke up. The rights of the American company were bought up by the Austrian Baron von Overbeck and the English merchant Mr Alfred Dent, who further obtained from the sultan of Brunei and the sultan of Sulu a series of charters conferring on them the sovereign authority in North Borneo under the titles of maharajah of Sabah, rajah of Gaya and Sandakan and Data Bandahara. In spite of the opposition of Spain, which claimed that the sultan of Sulu being a Spanish vassal could not dispose of his territory without her consent, the English company organized by Mr Dent succeeded in obtaining a charter of incorporation under Act of Parliament, 1st November 1881, as the "British North Borneo Company," with right to acquire other interests in, over, or affecting the territories or property comprised in the several grants.

The text of the charter will be found in the *London Gazette*, 8th November 1881 and in the appendix to Mr Joseph Hatton's *New Ceylon* (1881); see also Frank Hatton, *North Borneo*, 1885; the *Century Magazine*, 1885; the *Edinburgh Review*, 1882; and the *English Illustrated Magazine*, 1885.

SABAS, or SABBAS, ST (Syr. *Mār Sābhā*), one of the early leaders of monasticism in Palestine, was a native of Cappadocia, born about 439. While still a child he accompanied his parents to Alexandria, whence in his eighteenth year, having made choice of the ascetic life, he removed to Palestine, settling at the desolate spot now occupied by the convent called by his name, about two hours from the north-west shore of the Dead Sea. As his reputation for holiness increased he was joined by others, who ultimately constituted a "laura" under the rule of St Basil. He took some part in the doctrinal controversies of the day, being a zealous defender of the decrees of Chalcedon. He died about 532 and is commemorated on 5th December. Another saint of this name, surnamed "the Goth," suffered martyrdom at the hands of Athanaric, the Visigothic king, in the reign of Valentinian; he is commemorated on 15th (or 18th) April. See also Hoffmann, *Syr. Acten Persischer Märtyrer* (1880), Nos. iv. and xii., for lives of two martyrs named Sābhā.

SABBATH (שַׁבָּת), the day of sacred rest which among the Hebrews followed six days of labour and closed the week.

1. *Observance of the Sabbath.*—The later Jewish Sabbath, observed in accordance with the rules of the Scribes, was a very peculiar institution, and formed one of the most marked distinctions between the Hebrews and other nations, as appears in a striking way from the fact that on this account alone the Romans found themselves compelled to exempt the Jews from all military service. The rules of the Scribes enumerated thirty-nine main kinds of work forbidden on the Sabbath, and each of these prohibitions gave rise to new subtleties. Jesus's disciples, for example, who plucked ears of corn in passing through a field on the holy day, had, according to Rabbinical casuistry, violated the third of the thirty-nine rules, which forbade harvesting; and in healing the sick Jesus Himself broke the rule that a sick man should not receive medical aid on the Sabbath unless his life was in danger. In fact, as our Lord puts it, the Rabbinical theory seemed to be that the Sabbath was not made for man but man for the Sabbath, the observance of which was so much an end in itself that the rules prescribed for it did not require to be justified by appeal to any larger principle of religion or humanity. The precepts of the law were valuable in the eyes of the Scribes because they were the seal of Jewish particularism, the barrier erected between the world at large and the exclusive community of Jehovah's grace. For this purpose the most arbitrary precepts were the most effective, and none were more so than the complicated rules of Sabbath observance. The ideal of the Sabbath which all these rules aimed at realizing was absolute rest

from everything that could be called work; and even the exercise of those offices of humanity which the strictest Christian Sabbatarians regard as a service to God, and therefore as specially appropriate to His day, was looked on as work. To save life was allowed, but only because danger to life "superseded the Sabbath." In like manner the special ritual at the temple prescribed for the Sabbath by the Pentateuchal law was not regarded as any part of the hallowing of the sacred day; on the contrary, the rule was that, in this regard, "Sabbath was not kept in the sanctuary." Strictly speaking, therefore, the Sabbath was neither a day of relief to toiling humanity nor a day appointed for public worship; the positive duties of its observance were to wear one's best clothes, eat, drink, and be glad (justified from Isa. lviii. 13). A more directly religious element, it is true, was introduced by the practice of attending the synagogue service; but it is to be remembered that this service was primarily regarded not as an act of worship but as a meeting for instruction in the law. So far, therefore, as the Sabbath existed for any end outside itself it was an institution to help every Jew to learn the law, and from this point of view it is regarded by Philo and Josephus, who are accustomed to seek a philosophical justification for the peculiar institutions of their religion. But this certainly was not the leading point of view with the mass of the Rabbins;¹ and at any rate it is quite certain that the synagogue is a post-exilic institution, and therefore that the Sabbath in old Israel must either have been entirely different from the Sabbath of the Scribes, or else must have been a mere day of idleness and feasting, not accompanied by any properly religious observances or having any properly religious meaning. The second of these alternatives may be dismissed as quite inconceivable, for, though many of the religious ideas of the old Hebrews were crude, their institutions were never arbitrary and meaningless, and when they spoke of consecrating the Sabbath they must have had in view some religious exercise of an intelligible kind by which they paid worship to Jehovah.

Indeed, that the old Hebrew Sabbath was quite different from the Rabbinical Sabbath is demonstrated in the trenchant criticism which Jesus directed against the latter (Matt. xii. 1-14; Mark ii. 27). The general position which He takes up, that "the Sabbath is made for man and not man for the Sabbath," is only a special application of the wider principle that the law is not an end in itself but a help towards the realization in life of the great ideal of love to God and man, which is the sum of all true religion. But Jesus further maintains that this view of the law as a whole, and the interpretation of the Sabbath law which it involves, can be historically justified from the Old Testament. And in this connexion He introduces two of the main methods to which historical criticism of the Old Testament has recurred in modern times: He appeals to the oldest history rather than to the Pentateuchal code as proving that the later conception of the law was unknown in ancient times (Matt. xii. 3, 4), and to the exceptions to the Sabbath law which the Scribes themselves allowed in the interests of worship (ver. 5) or humanity (ver. 11), as showing that the Sabbath must originally have been devoted to purposes of worship and humanity, and was not always the purposeless arbitrary thing which the schoolmen made it to be. Modern criticism of the history of Sabbath observance among the Hebrews has done nothing more than follow out these arguments in detail, and show that the result is in agreement with what is known as to the dates of the several component parts of the Pentateuch.

¹ See the Mishnah, tr. "Shabbath," and *B. of Jubilees*, ch. 1; and compare Schürer, *Gesch. d. jüd. Volkes*, ii. 357, 376, 393 sq., where the Rabbinical Sabbath is well explained and illustrated in detail.

Of the legal passages that speak of the Sabbath all those which show affinity with the doctrine of the Scribes—regarding the Sabbath as an arbitrary sign between Jehovah and Israel, entering into details as to particular acts that are forbidden, and enforcing the observance by severe penalties, so that it no longer has any religious value, but appears as a mere legal constraint—are post-exilic (Exod. xvi. 23-30, xxxi. 12-17, xxxv. 1-3; Num. xv. 32-36); while the older laws only demand such cessation from daily toil, and especially from agricultural labour, as among all ancient peoples naturally accompanied a day set apart as a religious festival, and in particular lay weight on the fact that the Sabbath is a humane institution, a holiday for the labouring classes (Exod. xxiii. 12; Deut. v. 13-15). As it stands in these ancient laws, the Sabbath is not at all the unique thing which it was made to be by the Scribes. "The Greeks and the barbarians," says Strabo (x. 3, 9), "have this in common, that they accompany their sacred rites by a festal remission of labour." So it was in old Israel: the Sabbath was one of the stated religious feasts, like the new moon and the three great agricultural sacrificial celebrations (Hosea ii. 11); the new moons and the Sabbaths alike called men to the sanctuary to do sacrifice (Isa. i. 14); the remission of ordinary business belonged to both alike (Amos viii. 5), and for precisely the same reason. Hosea even takes it for granted that in captivity the Sabbath will be suspended, like all the other feasts, because in his day a feast implied a sanctuary.

This conception of the Sabbath, however, necessarily underwent an important modification in the 7th century B.C., when the local sanctuaries were abolished, and those sacrificial rites and feasts which in Hosea's time formed the essence of every act of religion were limited to the central altar, which most men could visit only at rare intervals. From this time forward the new moons, which till then had been at least as important as the Sabbath and were celebrated by sacrificial feasts as occasions of religious gladness, fall into insignificance, except in the conservative temple ritual. The Sabbath did not share the same fate, but with the abolition of local sacrifices it became for most Israelites an institution of humanity divorced from ritual. So it appears in the Deuteronomic decalogue, and presumably also in Jer. xvii. 19 *sq.* In this form the institution was able to survive the fall of the state and the temple, and the seventh day's rest was clung to in exile as one of the few outward ordinances by which the Israelite could still show his fidelity to Jehovah and mark his separation from the heathen. Hence we understand the importance attached to it in the exilic literature (Isa. lvi. 2 *sq.*, lviii. 13), and the character of a sign between Jehovah and Israel ascribed to it in the post-exilic law. This attachment to the Sabbath, beautiful and touching so long as it was a spontaneous expression of continual devotion to Jehovah, acquired a less pleasing character when, after the exile, it came to be enforced by the civil arm (Neh. xiii.), and when the later law even declared Sabbath-breaking a capital offence. But it is just to remember that without the stern discipline of the law the community of the second temple could hardly have escaped dissolution, and that Judaism alone preserved for Christianity the hard-won achievements of the prophets.

The Sabbath exercised a twofold influence on the early Christian church. On the one hand, the weekly celebration of the resurrection on the Lord's day could not have arisen except in a circle that already knew the week as a sacred division of time; and, moreover, the manner in which the Lord's day was observed was directly influenced by the synagogue service. On the other hand, the Jewish Christians continued to keep the Sabbath, like other points of the old law. Eusebius (*H.E.*, iii. 27) remarks that the

Ebionites observed both the Sabbath and the Lord's day; and this practice obtained to some extent in much wider circles, for the *Apostolical Constitutions* recommend that the Sabbath shall be kept as a memorial feast of the creation as well as the Lord's day as a memorial of the resurrection. The festal character of the Sabbath was long recognized in a modified form in the Eastern Church by a prohibition of fasting on that day, which was also a point in the Jewish Sabbath law (comp. Judith viii. 6).

On the other hand, Paul had quite distinctly laid down from the first days of Gentile Christianity that the Jewish Sabbath was not binding on Christians (Rom. xiv. 5 *sq.*; Gal. iv. 10; Col. ii. 16), and controversy with Judaizers led in process of time to direct condemnation of those who still kept the Jewish day (*e.g.*, Co. of Laodicea, 363 A.D.). Nay, in the Roman Church a practice of fasting on Saturday as well as on Friday was current before the time of Tertullian. The steps by which the practice of resting from labour on the Lord's day instead of on the Sabbath was established in Christendom and received civil as well as ecclesiastical sanction will be spoken of in SUNDAY; it is enough to observe here that this practice is naturally and even necessarily connected with the religious observance of the Lord's day as a day of worship and religious gladness, and is in full accordance with the principles laid down by Jesus in His criticism of the Sabbath of the Scribes. But of course the complete observance of Sunday rest was not generally possible to the early Christians before Christendom obtained civil recognition. For the theological discussions whether and in what sense the fourth commandment is binding on Christians, see DECALOGUE, vol. vii. p. 17.

2. *Origin of the Sabbath.*—As the Sabbath was originally a religious feast, the question of the origin of the Sabbath resolves itself into an inquiry why and in what circle a festal cycle of seven days was first established. In Gen. ii. 1-3 and in Exod. xx. 11 the Sabbath is declared to be a memorial of the completion of the work of creation in six days. But it appears certain that the decalogue as it lay before the Deuteronomist did not contain any allusion to the creation (see DECALOGUE, vol. vii. p. 16), and it is generally believed that this reference was added by the same post-exilic hand that wrote Gen. i. 1-ii. 4a. The older account of the creation in Gen. ii. 4b *sq.* does not recognize the hexaemeron, and it is even doubtful whether the original sketch of Gen. i. distributed creation over six days. The connexion, therefore, between the seven days' week and the work of creation is now generally recognized as secondary. The week and the Sabbath were already known to the writer of Gen. i., and he used them to give the framework for his picture of the creation, which in the nature of things could not be literal and required some framework. At the same time, there was a peculiar appropriateness in associating the Sabbath with the doctrine that Jehovah is the Creator of all things; for we see from Isa. xl.-lxvi. that this doctrine was a mainstay of Jewish faith in those very days of exile which gave the Sabbath a new importance for the faithful.

But, if the week as a religious cycle is older than the idea of the week of creation, we cannot hope to find more than probable evidence of the origin of the Sabbath. At the time of the exile the Sabbath was already an institution peculiarly Jewish, otherwise it could not have served as a mark of distinction from heathenism. This, however, does not necessarily imply that in its origin it was specifically Hebrew, but only that it had acquired distinguishing features of a marked kind. What is certain is that the origin of the Sabbath must be sought within a circle that used the week as a division of time. Here again we must distinguish between the week as

such and the astrological week, *i.e.*, the week in which the seven days are named each after the planet which is held to preside over its first hour. If the day is divided into twenty-four hours and the planets preside in turn over each hour of the week in the order of their periodic times (Saturn, Jupiter, Mars, Sun, Venus, Mercury, Moon), we get the order of days of the week with which we are familiar. For, if the Sun presides over the first hour of Sunday, and therefore also over the eighth, the fifteenth, and the twenty-second, Venus will have the twenty-third hour, Mercury the twenty-fourth, and the Moon, as the third in order from the sun, will preside over the first hour of Monday. Mars, again, as third from the Moon, will preside over Tuesday (Dies Martis, Mardi), and so forth. This astrological week became very current in the Roman empire, but was still a novelty in the time of Dio Cassius (xxxvii. 18). This writer believed that it came from Egypt; but the old Egyptians had a week of ten, not of seven days, and the original home of astrology and of the division of the day into twenty-four hours is Chaldæa. It is plain, however, that there is a long step between the astrological assignation of each hour of the week to a planet and the recognition of the week as an ordinary division of time by people at large. Astrology is in its nature an occult science, and there is not the slightest trace of a day of twenty-four hours among the ancient Hebrews, who had the week and the Sabbath long before they had any acquaintance with the planetary science of the Babylonian priests. Moreover, it is quite clear from extant remains of Assyrian calendars that our astrological week did not prevail in civil life even among the Babylonians and Assyrians: they did not dedicate each day in turn to its astrological planet. These facts make it safe to reject one often-repeated explanation of the Sabbath, *viz.*, that it was in its origin what it is in the astrological week, the day sacred to Saturn, and that its observance is to be derived from an ancient Hebrew worship of that planet. In truth there is no evidence of the worship of Saturn among the oldest Hebrews; Amos v. 26, where Chiun (Kaiwan) is taken by many to mean Saturn, is of uncertain interpretation, and, when the tenses are rightly rendered, refers not to idolatry of the Israelites in the wilderness but to the time of the prophet.

The week, however, is found in various parts of the world in a form that has nothing to do with astrology or the seven planets, and with such a distribution as to make it pretty certain that it had no artificial origin, but suggested itself independently, and for natural reasons, to different races. In fact the four quarters of the moon supply an obvious division of the month; and, wherever new moon and full moon are religious occasions, we get in the most natural way a sacred cycle of fourteen or fifteen days, of which the week of seven or eight days (determined by half moon) is the half. Thus the old Hindus chose the new and the full moon as days of sacrifice; the eve of the sacrifice was called *upavasatha*, and in Buddhism the same word (*upōsatha*) has come to denote a Sabbath observed on the full moon, on the day when there is no moon, and on the two days which are eighth from the full and the new moon respectively, with fasting and other religious exercises.¹

From this point of view it is most significant that in the older parts of the Hebrew Scriptures the new moon and the Sabbath are almost invariably mentioned together. The month is beyond question an old sacred division of time common to all the Semites; even the Arabs, who received the week at quite a late period from the Syrians

(Bīrūnī, *Chronology*, Eng. tr., p. 58), greeted the new moon with religious acclamations. And this must have been an old Semitic usage, for the word which properly means "to greet the new moon" (*ahalla*) is, as Lagarde (*Orientalia*, ii. 19) has shown, etymologically connected with the Hebrew words used of any festal joy. Among the Hebrews, or rather perhaps among the Canaanites, whose speech they borrowed, the joy at the new moon became the type of religious festivity in general. Nor are other traces wanting of the connexion of sacrificial occasions—*i.e.*, religious feasts—with the phases of the moon among the Semites. The Harranians had four sacrificial days in every month, and of these two at least were determined by the conjunction and opposition of the moon.²

That full moon as well as new moon had a religious significance among the ancient Hebrews seems to follow from the fact that, when the great agricultural feasts were fixed to set days, the full moon was chosen. In older times these feast-days appear to have been Sabbaths (Lev. xxiii. 11; comp. PASSOVER, vol. xviii. p. 344).

A week determined by the phases of the moon has an average length of $29\frac{1}{2} \div 4 = 7\frac{3}{8}$ days, *i.e.*, three weeks out of eight would have eight days. But there seems to be in 1 Sam. xx. 27, compared with vv. 18, 24, an indication that in old times the feast of the new moon lasted two days—a very natural institution, since it appears that the feast was fixed in advance, while the Hebrews of Saul's time cannot have been good enough astronomers to know beforehand on which of two successive days the new moon would actually be observed.³ In that case a week of seven working days would occur only once in two months. We cannot tell when the Sabbath became dissociated from the month; but the change seems to have been made before the Book of the Covenant, which already regards the Sabbath simply as an institution of humanity and ignores the new moon. In both points it is followed by Deuteronomy.

The Babylonian and Assyrian Sabbath.—The word "Sabbath" (*sabbathu*), with the explanation "day of rest of the heart," is claimed as Assyrian on the basis of a textual emendation made by F. Delitzsch in II. Rawl., 32, 16. The value of this isolated and uncertain testimony cannot be placed very high, and it seems to prove too much, for it is practically certain that the Babylonians at the time of the Hebrew exile cannot have had a Sabbath exactly corresponding in conception to what the Hebrew Sabbath had become under very special historical circumstances. What we do know from a calendar of the intercalary month Elul II. is that in that month the 7th, 14th, 19th, 21st, and 28th days had a peculiar character, and that certain acts were forbidden on them to the king and others. There is the greatest uncertainty as to the details (compare the very divergent renderings in *Records of the Past*, vii. 160 sq.; Schrader, *K.A.T.*, 2d ed., p. 19; Lotz, *Qu. de historia Sabbati*, 39 sq.); but these days, which are taken to be Assyrian Sabbaths, are certainly not "days of rest of the heart," and to all appearance are unlucky days, and expressly designated as such.⁴ If, therefore, they are "Assyrian Sabbaths" at all, they are exactly opposite in character to the Hebrew Sabbath, which Hosea describes as a day of gladness, and which never ceased to be a day of feasting and good cheer.

Etymology of the word "Sabbath."—The grammatical inflexions of the word "Sabbath" show that it is a feminine form, properly *shabbat-t* for *shabbāt-t*, from שַׁבָּת II. The root has nothing to do with resting in the sense of enjoying repose; in transitive forms and applications it means to "sever," to "put an end to," and intransitively it means to "desist," to "come to an end." The grammatical form of *shabbath* suggests a transitive sense, "the divider," and apparently indicates the Sabbath as dividing the month. It may mean the day which puts a stop to the week's work, but this is less likely. It certainly cannot be translated "the day of rest."

Sabbatical Year.—The Jews under the second temple observed every seventh year as a Sabbath according to the (post-exilic) law of Lev. xxv. 1-7. It was a year in which all agriculture was re-

² The others—according to the *Fihrist*, 319, 14—are the 17th and the 28th.

³ It appears from Judith viii. 6 that even in later times there were two days at the new moon on which it was improper to fast.

⁴ Lotz says they are lucky days; but the expression which he renders "*dies faustus*" is applied to every day in the calendar. The rest of his book does not rise above this example of acumen.

¹ Childers, *Pali Dict.*, p. 535; Kern, *Buddhismus* (Ger. tr.), p. 8; *Mahāvagga*, ii. 1, 1 (Eng. tr., i. 239, 291).

mitted, in which the fields lay unsown, the vines grew unpruned, and even the natural produce was not gathered in. That this law was not observed before the captivity we learn from Lev. xxvi. 34 sq.; indeed so long as the Hebrews were an agricultural people with little trade, in a land often ravaged by severe famines, such a law could not have been observed. Even in later times it was occasionally productive of great distress (1 Mac. vi. 49, 53; Jos., *Antt.*, xiv. 16, 2). In the older legislation, however, we already meet with a seven years' period in more than one connexion. The release of a Hebrew servant after six years' labour (Exod. xxi. 2 sq.; Deut. xv. 12 sq.) has only a remote analogy to the Sabbatical year. But in Exod. xxiii. 10, 11 it is prescribed that the crop of every seventh year (apparently the self-sown crop) shall be left for the poor, and after them for the beasts. The difference between this and the later law is that the seventh year is not called a Sabbath, and that there is no indication that all land was to lie fallow on the same year. In this form a law prescribing one year's fallow in seven may have been anciently observed. It is extended in ver. 11 to the vineyard and the olive oil, but here the culture necessary to keep the vines and olive trees in order is not forbidden; the precept is only that the produce is to be left to the poor. In Deuteronomy this law is not repeated, but a fixed seven years' period is ordained for the benefit of poor debtors, apparently in the sense that in the seventh year no interest is to be exacted by the creditor from a Hebrew, or that no proceedings are to be taken against the debtor in that year (Deut. xv. 1 sq.). (W. R. S.)

SABELLIUS. Even after the elimination of Gnosticism the church remained without any uniform Christology; the Trinitarians and the Unitarians continued to confront each other, the latter at the beginning of the 3d century still forming the large majority. These in turn split into two principal groups—the Adoptianists and the Modalists—the former holding Christ to be the man chosen of God, on whom the Holy Spirit rested in a quite unique sense, and who after toil and suffering, through His oneness of will with God, became divine, the latter maintaining Christ to be a manifestation of God Himself. Both groups had their scientific theologians who sought to vindicate their characteristic doctrines, the Adoptianist divines holding by the Aristotelian philosophy, and the Modalists by that of the Stoics; while the Trinitarians (Tertullian, Hippolytus, Origen, Novatian), on the other hand, appealed to Plato.

In Rome Modalism was the doctrine which prevailed from Victor to Calixtus (c. 190-220). The bishops just named protected within the city the schools of Epigonus and Cleomenes, where it was taught that the Son is identical with the Father. But the presbyter Hippolytus was successful in convincing the leaders of that church that the Modalistic doctrine taken in its strictness was contrary to Scripture. Bishop Calixtus saw himself under the necessity of abandoning his friends and setting up a mediating formula designed to harmonize the Trinitarian and the Modalistic positions. But, while excommunicating the strict Unitarians (Monarchians), he also took the same course with Hippolytus and his followers, declaring their teaching to be ditheism. The mediation formula, however, proposed by Calixtus became the bridge by which, in the course of the decades immediately following, the doctrine of the Trinity made its way into the Roman Church. In the year 250, when the Roman presbyter Novatian wrote his book *De Trinitate*, the doctrine of Hippolytus, once discredited as ditheism, had already become official there. At the same time Rome and most of the other churches of the West still retained a certain leaning towards Modalistic monarchianism. This appears, on the one hand, in the use of expressions having a Modalistic ring about them—see especially the poems of Commodian, written about the time of Valerian—and, on the other hand, in the rejection of the doctrine that the Son is subordinate to the Father and is a creature (witness the controversy between Dionysius of Alexandria and Dionysius of Rome), as well as in the readiness of the West to accept the formula of Athanasius, that the Father and the Son are one and the same in substance (*ὁμοούσιον*).

The strict Modalists, whom Calixtus had excommunicated along with their most zealous opponent Hippolytus, were led by Sabellius, who was perhaps a Libyan by birth. His party continued to subsist in Rome for a considerable time afterwards,¹ and withstood Calixtus as an unscrupulous apostate. In the West, however, the influence of Sabellius seems never to have been important; in the East, on the other hand, after the middle of the 3d century his doctrine found much acceptance, first in the Pentapolis and afterwards in other provinces.² It was violently controverted by the bishops, notably by Dionysius of Alexandria, and the development in the East of the philosophical doctrine of the Trinity after Origen (from 260 to 320) was very powerfully influenced by the opposition to Sabellianism. Thus, for example, at the great synod held in Antioch in 268 the word *ὁμοούσιος* was rejected, as seeming to favour Unitarianism. The Sabellian doctrine itself, however, during the decades above mentioned underwent many changes in the East and received a philosophical dress. In the 4th century this and the allied doctrine of Marcellus of Ancyra were frequently confounded, so that it is exceedingly difficult to arrive at a clear account of it in its genuine form. Sabellianism, in fact, became a collective name for all those Unitarian doctrines in which the divine nature of Christ was acknowledged. The teaching of Sabellius himself was indubitably very closely allied to the older Modalism ("Patripassianism") of Noetus and Praxeas, but was distinguished from it by its more careful theological elaboration and by the account it took of the Holy Spirit. His central proposition was to the effect that Father, Son, and Holy Spirit are the same person, three names thus being attached to one and the same being. What weighed most with Sabellius was the monotheistic interest. The One Being was also named by him *ὑποπάρων*,—an expression purposely chosen to obviate ambiguity. To explain how one and the same being could have various forms of manifestation, he pointed to the tripartite nature of man (body, soul, spirit), and to the sun, which manifests itself as a heavenly body, as a source of light, and also as a source of warmth. He further maintained that God is not at one and the same time Father, Son, and Spirit, but, on the contrary, has been active in three consecutive energies,—first in the prosopon of the Father as Creator, then in the prosopon of the Son as Redeemer, and lastly in the prosopon of the Spirit as the Giver of Life. It is by this doctrine of the succession of the prosopa that Sabellius is essentially distinguished from the older Modalists. In particular it is significant, in conjunction with the reference to the Holy Spirit, that Sabellius regards the Father also as merely a form of manifestation of the one God,—in other words, has formally put Him in a position of complete equality with the other Persons. This view prepares the way for Augustine's doctrine of the Trinity. Sabellius himself appears to have made use of Stoical formulas (*πλατύνεσθαι, συστέλλεσθαι*), but he chiefly relied upon Scripture, especially such passages as Deut. vi. 4, Exod. xx. 3, Isa. xlv. 6, John x. 38. Of his later history nothing is known; his followers died out in the course of the 4th century.

The sources of our knowledge of Sabellianism are Hippolytus (*Philos.*, bk. ix.), Epiphanius (*Hær.*, lxii.), and Dionys. Alex. (*Epp.*); also various passages in Athanasius and the other fathers of the 4th century. For modern discussions of the subject see Schleiermacher (*Theol. Ztschr.*, 1822, hft. 3), Lange (*Ztschr. f. luth. Theol.*, 1832, ii. 2), Döllinger (*Hippolyt u. Kallist*, 1853), Zahn (*Marcell v. Ancyra*, 1867), and Harnack (*sv. "Monarchianismus,"* in Herzog-Plitt, *Encykl. f. Prot. Theol.*, x. 199 sq.). (A. H.A.)

¹ In the 18th century there was discovered in one of the catacombs of Rome an inscription containing the words "qui et Filius dicieris et Pater inveniris." This can only have come from a Sabellian.

² Whether Sabellius himself ever visited the East is unknown.

SABIANS. In three passages of the Koran Mohammed mentions between the Jews and the Christians a sect whom he calls Sabians (*Sābi'āna*). He distinguishes them from the Magians and polytheists (xxii. 17), and appears to say that they believed in God and in the day of resurrection and judgment. It has commonly been supposed that the sect referred to is the **MANDEANS** (*q.v.*); but it is more probable that they were some obscure half-Christian body (*Elkesaites?*), which had representatives in Arabia itself (see **MOHAMMEDANISM**, vol. xvi. p. 547). The name is derived from the Aramaic סַבְיָא, with a softening of *ס* to *ס*, such as took place in certain dialects of that speech, and means "Baptists." The older Mohammedan theologians were agreed that the Sabians possessed a written revelation, and were entitled accordingly to enjoy a toleration not granted to mere heathen, and it appears that the Mandæans got the benefit of this, whether they were the sect Mohammed had in view or not. But under Al-Mamūn (830) a body that had certainly no claim to be deemed other than polytheists began to shield themselves under the same name, viz., the Harranians, or remnant of the old heathen of Mesopotamia. Star-worship had a chief place in the religion of the Harranians, as it had had in the older Babylonian and Syrian faiths, but they had partly disguised their polytheism in a fantastic philosophy, so that they were able on occasion to pose as people of enlightened beliefs. Accounts of these false Sabians reached the West through Maimonides, and then through Arabic sources, long before it was understood that, in this application, the name was only a disguise. Hence the greatest confusion prevailed in all European accounts of them till Chwolsohn published in 1856 his *Sabier und Sabismus*, in which the authorities for the history and belief of the Harranians in the Middle Ages are collected and discussed. See also Dozy and De Goeje in the *Actes* of the sixth Oriental congress, ii. 1, 185 *sq.*, Leyden, 1885. It is quite inappropriate to call star-worshippers in general Sabians or Zabians or to speak of a distinct Sabian religion, as older writers do. The religion of the Harranians is simply a modernized form of the old Syrian polytheism.

SABICU WOOD is the produce of a large leguminous tree, *Lysiloma Sabicu*, a native of Cuba, where alone it appears to be found. The wood has a rich mahogany colour; it is exceedingly heavy, hard, and durable, and therefore most valuable for shipbuilding. Sabicu, on account of its durability, was selected for the stairs of the Great Exhibition (London) of 1851, and, notwithstanding the enormous traffic which passed over them, the wood at the end was found to be little affected by wear.

SABINE, SIR EDWARD (1788-1883), astronomer, was born in Dublin on 14th October 1788, a scion of a family said to be of Italian origin. He was educated at Woolwich and obtained a commission in the Royal Artillery at the age of fifteen. He attained the rank of major-general in 1859. His only experience of actual warfare seems to have been at the siege of Fort Erie in 1814; but few men have seen more than he of active and sometimes perilous service. In early life he devoted himself to astronomy and physical geography, and in consequence he was appointed astronomer to various expeditions, among others that of Sir J. Ross (1818) in search of the North-West Passage, and that of Sir E. Parry soon afterwards. Later, he spent long periods on the inter-tropical coasts of Africa and America, and again among the snows of Spitzbergen. Sir Edward Sabine died at East Sheen, Surrey, on 26th May 1883.

Of Sabine's scientific work two branches in particular deserve very high credit—his determination of pendulum data for the investigation of the figure of the earth and his extensive researches connected with terrestrial magnetism. His pendulum observations were the first to show the altogether unexpected amount of accuracy attainable in a matter which, under the most favourable conditions,

is one of great delicacy, but which had to be pursued by him under circumstances often of peculiar difficulty. The establishment of a system of magnetic observatories in various parts of British territory all over the globe was accomplished mainly on his representations; and to the direction of these observatories and to the reduction and discussion of the observations a great part of his life was devoted. His published papers, as shown by the Royal Society's *Catalogue*, amounted in 1872 to 101. While the majority bear on one or other of the subjects just mentioned, others deal with such widely different topics as the birds of Greenland, ocean temperatures, the Gulf Stream, barometric measurement of heights, arcs of meridian, glacier transport of rocks, the volcanoes of the Sandwich Islands, and various points of meteorology. Sabine occupied for ten years (1861-71) the president's chair of the Royal Society, and was made K.C.B. in 1869. Though he cannot be said to have been a man of striking originality, his unflinching devotion to his work deservedly won him an honourable position among the foremost scientific men of the present century.

SABINES. The Sabines (Sabini) were a people of Central Italy, who played an important part in the early history of Rome. According to all old writers they were one of the most ancient nations of Italy, and the parent stock from which many of the other tribes that occupied the central and southern regions of the peninsula derived their origin. Of their own origin and affinities we know very little. Strabo calls them a very ancient race and "autochthonous," which may be taken as signifying that there was no authentic tradition of their immigration, or of the quarter from whence they came. The story of their Laconian descent may be safely rejected as one of those fictions by which a certain class of the later Greek writers sought to derive every people in Italy from a Greek origin. But the evidence concerning their language, scanty as it is, is sufficient to prove that they were a cognate race with the neighbouring Umbrians and Oscans, as well as, more remotely, with the Latins. Cato, the best authority among the Roman writers with respect to the different races of Italy, affirmed that the Sabines originally occupied the country about Amiternum, in the upper valley of the Aternus, at the foot of the loftiest group of the Apennines. From thence they gradually extended themselves into the fertile valleys about Reate, where we find them established in historical times, and occupied the tract from thence to the Tiber and the Anio. But even in its widest extension the region held by the Sabines was of small dimensions, and for the most part of a rugged and mountainous character. Hence it was natural that they should seek a place for their superfluous population by repeated emigrations into the neighbouring districts, and the general tradition among Roman writers ascribed the origin of several of the more powerful and populous nations of the peninsula to such emigrations. This result was especially promoted by a custom which, though not unknown to the other nations of Italy, appears to have been peculiarly characteristic of the Sabines—that of a *Ver Sacrum*, or "sacred spring," when everything born in that year was consecrated to some local divinity, most frequently to Mamers or Mars. All the cattle were duly sacrificed, while the young men were allowed to grow up to manhood, and then sent forth in a body to seek for themselves new abodes beyond the limits of their native land. To such colonies is ascribed the foundation of the Picentes or people of Picenum, the Samnites, and the Hirpini. Of these the last-mentioned derived their name from *hirpus*, the Sabine name for a wolf, an animal of that description being supposed to have been divinely sent as the leader of the colony, as a woodpecker (*picus*), also sacred to Mars, became that of the Piceni. The Peligni also, as we learn from Ovid, himself a native of the district, claimed a Sabine origin, and the same was probably the case with the smaller kindred tribes of the Marsi, Marrucini, and Vestini. The Samnites, again, in their turn sent forth the Frentani and the Lucanians, who extended their dominion throughout the mountainous regions of

Southern Italy and carried their arms from the Adriatic to the Sicilian Straits.

Meanwhile the Sabines themselves were confined within comparatively narrow limits, and their extension towards the south was checked by the growing power of the Latins. Here their power appears to have attained its highest point about the time of the foundation of Rome, and the legendary history, familiar to every schoolboy, of the contests between Romulus and Tatius, the divided sovereignty at one time established between them, and the peaceful reign and legislation of the Sabine king Numa may be taken as representing the historical fact that the population of Rome really contained an important Sabine element, and that Sabine influences were largely intermixed with those of Latin origin, both in the civil institutions and still more in the religious rites and ceremonies of the rising republic. Beyond this it is impossible to pronounce with certainty as to the real value and significance of the traditions preserved to us in the poetical legends transmitted in the garb of history; and it is impossible in an article like the present to give even an outline of the various theories that have been devised by modern writers to put an historical interpretation upon the records thus preserved to us. It is clear, however, that the power of the Sabines was by no means broken, even by the establishment of the more powerful monarchy at Rome under the Tarquins, and for a period of more than fifty years after the fall of the monarchy we find the Romans engaged in almost perpetual hostilities against the Sabines on the one side and the Æquians and Volscians on the other. At length in the year 449 B.C. the Sabines were defeated by the consul M. Horatius, in an action which appears to have been of so decisive a character that we do not find them again appearing in arms against the Romans for a period of more than 160 years. Their quiescence is the more singular as during this interval the republic was engaged in the long series of the Samnite Wars, in which their adversaries were the direct descendants of the Sabines, and had therefore every claim on their support. Still more unaccountable is it that, after looking on with apparent neutrality for so long, we find the Sabines in the year 290 B.C. once more in arms against Rome, and that at a period when the Third Samnite War had for a time crushed all the hopes of their natural allies. The result was, as might have been expected, that they found themselves wholly unequal to contend single-handed against the power of Rome, and the consul M. Curius Dentatus reduced them to submission in a single campaign. They were severely punished for this defection; and henceforth their national existence was at an end. Those who survived the slaughter of the war were admitted to the position of Roman citizens, though at first without the right of suffrage, but twenty years after this also was granted them, and they were to all intents and purposes incorporated in the Roman state. Thus separated from all the tribes of kindred origin, they never again appear in history, and, like the Campanians and Latins, were content to swell the ranks of the Roman legions even in the fierce struggle of the Social War (91-88 B.C.). Under the arrangements of the Roman empire their very name was lost as a territorial designation, but it always continued in popular use, and was revived in the Middle Ages as that of an ecclesiastical province. Even at the present day every peasant in the neighbourhood of Rome will point to La Sabina as the familiar appellation of the lofty mountain tract to the north of the city.

The limits of the territory occupied by the Sabines do not appear to have varied much from a very early period till the days of Strabo. That geographer describes them as extending as far south as Eretum near the Tiber, on the road to Rome, and a few miles only from Cures, the

reputed birthplace of Tatius and Numa, but which in his time had become a mere village. The principal town of the Sabines was Reate (still called Rieti), in the midst of the beautiful and fertile valley of the Velino, and from thence they occupied the upper valley of that river to its sources in the Monte della Sibilla and the rugged mountain valleys which connected it with that of the Aternus. Here was found Amiternum, the original capital of the tribe, near the modern Aquila, and between that and Reate lay Interocrea (Antrodoco), in a pass that has always formed one of the leading lines of communication through the central Apennines. In the extreme north was Nursia (Norcia), noted for the coldness of its climate, and celebrated in ecclesiastical history as the birthplace of St Benedict. These were the only towns of any importance in the territory of the Sabines; but they lived for the most part scattered in villages about the mountains, a circumstance absurdly alleged by some Roman writers as a proof of their Laconian origin. It was doubtless owing to this habit, as well as to the rugged mountainous character of the country in which they dwelt, that the Sabines owed the primitive simplicity of their manners and the frugal and severe character which distinguished them even in the days of Augustus. All readers of Horace must be familiar with his frequent allusions to the moral purity and frugal manners of the people that surrounded his Sabine villa, which was situated on the reverse of Mount Lucretius, only about 15 miles from the rich and luxurious Tibur (Tivoli). The small town of Varia (Vicovaro), in its immediate neighbourhood, seems to have marked the frontier on this side.

No remains of the Sabine language are extant in the form of inscriptions, but coins struck during the Social War with the inscription "Safinim" show that the native appellation was the same as that in use among the Latins. The form "Sabellus" is frequently found in Latin writers as an ethnic adjective equivalent to Sabine; but the practice adopted by modern writers, of employing the term "Sabellian" to designate all the tribes of Sabine origin, including Samnites, Lucanians, &c., was first introduced by Niebuhr, and is not supported by any ancient authority. (E. H. B.)

SABLE (*Mustela zibellina*). See MARTEN, vol. xv. p. 577, and FUR, vol. ix. p. 838.

SABLES D'OLONNE, a seaport town of France, the chef-lieu of an arrondissement of the department of La Vendée, is situated on the Atlantic seaboard in 46° 30' N. lat., 300 miles south-west of Paris by the railway for Tours and La-Rochelle-sur-Yon. The town stands between the sea on the south and the port on the north, while on the west it is separated by a channel from the suburb of La Chaume, built at the foot of a range of dunes 65 feet high, which terminates southwards in the rocky peninsula of L'Aiguille (the Needle), defended by Fort St Nicholas. To the north of Sables extend salt-marshes and oyster-parks, stocked from Auray or Cape Breton, and yielding 6,000,000 to 8,000,000 oysters per annum. The port of Sables, consisting of a tidal basin and a wet-dock, is accessible only to vessels of from 350 to 400 tons, and is dangerous when the winds are from the south-west. The entrance is shown by six lights; a seventh lighthouse, that of the Barges, a mile out at sea to the west, has a height of 80 feet and is visible for 17 to 18 nautical miles. In 1882 145 vessels (62,073 tons) entered and 146 vessels (61,037 tons) cleared. The staple articles of trade are grain, wine, cattle, timber, salt, tar, fish, building stone, manures; 400 boats are engaged in the sardine fishery. The beautiful smoothly sloping beach, a mile in length, is much frequented by bathers. It is lined by an embankment which serves as a promenade and drive, and is bordered by hotels, villas, and cafés. The population in 1881 was 9769, that of the commune 10,420.

Founded by Basque or Spanish sailors, Sables was the first place in Poitou invaded by the Normans in 817. Louis XI., who went there in 1472, granted the inhabitants various privileges, improved the harbour, and fortified the entrance. Captured and recaptured during the Wars of Religion, the town afterwards became a nursery of hardy sailors and privateers, who harassed the Spaniards and afterwards the English. In 1696 Sables was bombarded by the combined fleets of England and Holland. Hurricanes have more than once caused grievous damage to town and harbour.

SACCATOO. See **SOKOTO**.

SACCHETTI, **FRANCO** (c. 1335-c. 1400), Italian novelist, was the son of Benci di Ugucione, surnamed "Buono," of the noble and ancient Florentine family of the Sacchetti (comp. Dante, *Par.*, c. xvi.), and was born at Florence about the year 1335. While still a young man he achieved repute as a poet, and he appears to have travelled on affairs of more or less importance as far as to Genoa, Milan, and "Ischiavonia." When a sentence of banishment was passed upon the rest of the house of Sacchetti by the Florentine authorities in 1380 it appears that Franco was expressly exempted, "per esser tanto uomo buono," and in 1383 he was one of the "eight," discharging the office of "prior" for the months of March and April. In 1385 he was chosen ambassador to Genoa, but preferred to go as podestà to Bibbiena in Casentino. In 1392 he was podestà of San Miniato, and in 1396 he held a similar office at Faenza. In 1398 he received from his fellow-citizens the post of captain of their then province of Romagna, having his residence at Portico. The date of his death is unknown; most probably it occurred about 1400, though some writers place it as late as 1410.

Sacchetti left a considerable number of *sonnetti*, *canzoni*, *ballate*, *madrigali*, &c., which have never been printed, but which are still extant in at least one MS. in the Laurentian library of Florence. His *Novelle* were first printed in 1724, from the MS. in the same collection, which, however, is far from complete. They were originally 300 in number, but only 258 in whole or in part now survive. They are written in pure and elegant Tuscan, and, based as they are for the most part on real incidents in the public and domestic life of Florence, they are valuable for the light they throw on the manners of that age, and occasionally also for the biographical facts preserved in them. But in no other respect do they come up to the corresponding compositions of his friend Boccaccio. Some of them, it need hardly be said, are very coarse—a feature not compensated for by the moralizings almost invariably appended—and many more are dull and pointless, leaving the impression, as Sismondi has remarked, that in that century of artistic advance the art of conversation had remained far behind the others.

SACCHI, **ANDREA** (c. 1600-1661), a leading painter of the later Roman school, was born in Rome in 1600, or perhaps as early as 1598. His father, Benedetto, a painter of undistinguished position, gave him his earliest instruction in the art; Andrea then passed into the studio of Albani, of whom he was the last and the most eminent pupil, and under Albani he made his reputation early. The painter of Sacchi's predilection was Raphael; he was the jealous opponent of Pietro da Cortona, and more especially of Bernini. In process of time he became one of the most learned designers and one of the soundest colourists of the Roman school. He went to Venice and to Lombardy to study Venetian colour and the style of Correggio; but he found the last-named master unadaptable for his own proper methods in art, and he returned to Rome. Sacchi was strong in artistic theory, and in practice slow and fastidious; it was his axiom that the merit of a painter consists in producing, not many middling pictures, but a few and perfect ones. His works have dignity, repose, elevated yet natural forms, severe but not the less pleasing colour, a learned treatment of architecture and perspective; he is thus a painter of the correct and laudable academic order, admired by connoisseurs rather than by ambitious students or the large public. His principal painting, often spoken of as the fourth best easel-picture in Rome—in the Vatican Gallery—is St Romuald relating his Vision to Five Monks of his Order. The pictorial *crux* of dealing

with these figures, who are all in the white garb of their order, has often been remarked upon; and as often the ingenuity and judgment of Sacchi have been praised in varying the tints of these habits according to the light and shade cast by a neighbouring tree. The Vatican Gallery contains also an early painting of the master,—the Miracle of St Gregory, executed in 1624; a mosaic of it was made in 1771 and placed in St Peter's. Other leading examples are the Death of St Anna, in S. Carlo ai Catinari; St Andrew, in the Quirinal; St Joseph, at Capo alle Case; also, in fresco, a ceiling in the Palazzo Barberini—Divine Wisdom—reckoned superior in expression and selection to the rival work of Pietro da Cortona. There are likewise altar-pieces in Perugia, Foligno, and Camerino. Sacchi, who worked almost always in Rome, left few pictures visible in private galleries: one, of St Bruno, is in Grosvenor House. He had a flourishing school: Nicholas Poussin and Carlo Maratta were his most eminent scholars; Luigi Garzi and Francesco Lauri were others, and Sacchi's own son Giuseppe, who died young, after giving very high hopes. This must have been an illegitimate son, for Andrea died unmarried. This event took place in Rome in 1661.

SACCHINI, **ANTONIO MARIA GASPARE** (1734-1786), musical composer, of the Italian school, was born at Pozzuoli, 23d July 1734, and educated under Durante at the Conservatorio di San Onofrio at Naples. His first serious opera was produced at Rome in 1762, and was followed by many others, nearly all of which were successful. In 1769 he removed to Venice; and in 1772 he visited London, where, notwithstanding a cruel cabal formed against him, he achieved a brilliant success, especially in his four new operas, *Tamerlano*, *Lucio Vero*, *Nitetti e Perseo*, and *Il Gran Cid*. Ten years later he met with an equally enthusiastic reception in Paris, where his *Rinaldo* was produced under the immediate patronage of Queen Marie Antoinette, to whom he had been recommended by the emperor Joseph II. But neither in England nor in France did his reputation continue to the end of his visit. He seems to have been everywhere the victim of bitter jealousy. Even Marie Antoinette was not able to support his cause in the face of the general outcry against the favour shown to foreigners; and by her command, most unwillingly given, his last opera and undoubted masterpiece, *Œdipe à Colone*, was set aside in 1786 to make room for Lemoine's *Phèdre*,—a circumstance which so preyed upon his mind that he died of chagrin, 7th October 1786.

Sacchini's style was rather graceful than elevated, and he was deficient both in creative power and originality. But the dramatic truth of his operas, more especially the later ones, is above all praise, and he never fails to write with the care and finish of a thorough and accomplished musician. *Œdipe* was extremely successful after his death, and has since been performed at the Académie nearly 600 times. The last performance of which any record has reached us took place in 1844.

SACHEVERELL, **HENRY** (1674-1724), an English church and state politician of extreme views, was born in 1674, the son of Joshua Sacheverell, rector of St Peter's, Marlborough, who at his death left a large family in poverty. Henry Sacheverell matriculated at Magdalen College, Oxford, 28th August 1689, and was demy of his college from 1689 to 1701 and fellow from 1701 to 1713. Addison, another Wiltshire lad, entered at the same college two years earlier, but was also elected a demy in 1689; he inscribed to Sacheverell in 1694 his account of the greatest English poets. Sacheverell took his degree of B.A. in 1693, and became M.A. in 1696 and D.D. in 1708. His first preferment was the small vicarage of Cannock in Staffordshire; but he leapt into notice when holding a preachiership at St Saviour's, Southwark. His famous sermons on the church in danger from the neglect of the Whig ministry to keep guard over its interests

were preached, the one at Derby, 14th August, the other at St Paul's Cathedral, 5th November 1709. They were immediately reprinted, the latter being dedicated to the lord mayor and the former to the author's kinsman, George Sacheverell, high sheriff of Derby for the year; and, as the passions of the whole British population were at this period keenly exercised between the rival factions of Whig and Tory, the vehement invectives of this furious divine on behalf of an ecclesiastical institution which supplied the bulk of the adherents of the Tories made him their idol. The Whig ministry, then slowly but surely losing the support of the country, were divided in opinion as to the propriety of prosecuting this zealous parson. Somers was against such a measure; but Godolphin, who was believed to be personally alluded to in one of these harangues under the nickname of "Volpone," urged the necessity of a prosecution, and gained the day. The trial lasted from 27th February to 23d March 1710, and the verdict was that Sacheverell should be suspended for three years and that the two sermons should be burnt at the Royal Exchange. This was the decree of the state, and it had the effect of making him a martyr in the eyes of the populace and of bringing about the downfall of the ministry. Immediately on the expiration of his sentence (13th April 1713) he was instituted to the valuable rectory of St Andrew's, Holborn, by the new Tory ministry, who despised the author of the sermons, although they dreaded his influence over the mob. He died at the Grove, Highgate, on 5th June 1724.

Ample information about his life and trial will be found in Hearne's *Diaries*, Bloxam's *Register of Magdalen*, iii. 98-110, and Hill Burton's *Queen Anne*, vol. ii. Mr Madan of the Bodleian Library has compiled a Sacheverell bibliography.

SACHS, HANS (1494-1576), the most eminent German poet of the 16th century, was born at Nuremberg on 5th November 1494. His father was a shoemaker, and Hans was trained to the same calling. Before beginning his apprenticeship, however, he was educated at the Latin school of Nuremberg. Having finished his "Lehrjahre" as a shoemaker, he began his "Wanderjahre" in 1511, and worked at his craft in many towns, including Ratisbon, Passau, Salzburg, Leipsic, Lübeck, and Osnabrück. In 1516 he returned to Nuremberg, where he remained during the rest of his life, working steadily at his business, and devoting his leisure time to literature. He married in 1519, and after his wife's death he married again in 1561. He died on 19th January 1576.

Sachs was much respected by his fellow-citizens, and acquired great fame as a poet. Early in life he received instruction in the principles and rules of the "Meistergesang," and at Munich in 1513 he completed his study of "the charming art." Afterwards he wrote many poems in the formal manner of the "Meistersinger," but to these efforts he attributed so little importance that he did not include them in his own collection of his works. Among his best writings are his hymns, in which he gave expression to the highest spiritual aspirations of the age of the Reformation. He was one of the most ardent adherents of Luther, and in 1523 wrote in his honour the poem beginning, "Die wittenbergisch Nachtigall, Die man jetz höret überall." This poem attracted much attention and was of great service to Luther. Sachs also wrote in verse many fables, parables, tales, and dialogues. Of his dramatic poems, the most remarkable are his *Shrove Tuesday Plays*, in each of which he offers a lively representation of an action without any attempt at exact portraiture or at a profound appreciation of motives. Works of this kind were popular before Sachs's time, but he gave them fresh vitality by his humour and fancy. Sachs had extraordinary fertility of imagination, and none of his German contemporaries approached him in his mastery of the forms of literary expression which were then known. He wrote thousands of poems, and in his lifetime a large number of them were printed, in three volumes; after his death two additional volumes appeared; and in recent times many volumes of his works in manuscript have been discovered. From about the middle of the 17th century, when German writers of verse became as a rule mere imitators of foreign models, Sachs was almost forgotten, until interest in his work was revived by Goethe; and many selections from his writings have

since been published. A complete edition, prepared by A. von Keller, has been issued by the Literary Society of Stuttgart. A biography of Sachs by M. Solomon Ranisch was published in 1765, and there are later biographies by J. L. Hoffmann (1847), Weller (1868), and Lützelberger (1874).

SACKING AND SACK MANUFACTURE. Sacking is a stout close-woven fabric, properly of flax, but now very largely made of jute. The chief centres of the manufacture are Dundee and Forfar in Scotland. Sacks, however, are made of many qualities and from different fibres, according to the purposes to which they are devoted. A large proportion of flour sacks, those particularly of American origin, are made of stout cotton. Numerous attempts have been made to manufacture seamless sacks; but none have met with success. The invention of a sewing-machine for the "overhead" seaming of sacks has been successfully solved in the machine of Laing and other inventors.

SACO, a city of the United States, in York county, Maine, on the left or north bank of the Saco river, opposite Biddeford, 9 miles from the sea and 100 from Boston by the Boston and Maine Railroad. The water-power furnished by the river, which here falls 55 feet, is utilized by various cotton-factories, machine-shops, lumber-mills, &c. Originally included in Biddeford, but separately incorporated in 1762 as Pepperellborough, Saco received its present name in 1805 and was made a city in 1867. The population was 5755 in 1870 and 6389 in 1880.

SACRAMENT. The Latin word *sacramentum*, meaning "an oath," is most commonly used by classical writers to denote the military oath of allegiance; for its technical application in legal phraseology see **ROMAN LAW**, vol. xx. p. 682. In the earliest ecclesiastical Latin traces of the old military meaning are still present; thus Tertullian (*Ad Mart.*, 3) writes, "We were called to the warfare of the living God in our very response to the sacramental words [in baptism]"; but the main import of the word has entirely changed, it being used simply as the equivalent of the Greek *μυστήριον*. Thus even in the Vulgate we still have the "sacrament of godliness" (1 Tim. iii. 16), "of the seven stars" (Rev. i. 20), "of the woman and the beast" (Rev. xvii. 7); but in earlier Latin versions the word also occurred in numerous other places where "mysterium" is now found (e.g., Rom. xvi. 25; 1 Cor. xiii. 2). In addition to its general sense the word *μυστήριον* not unnaturally soon came to have for Christians a more special meaning as denoting those external rites of their religion, solemn, instructive, and more or less secret, which had most analogy with the MYSTERIES (*q.v.*) of paganism. No attempt, however, was at first made to enumerate or to define these. Tertullian speaks of the sacrament of baptism and the Eucharist, Cyprian of "either sacrament," meaning baptism and confirmation, and many others, following Eph. v. 22 (see Vulgate), of the sacrament of marriage, but all with the utmost vagueness. Augustine's definition of the word was little more explicit, but for centuries it was all the Western Church had, and for even a longer period it continued to be a sufficiently adequate expression of the Oriental view also. According to him a sacrament is "the visible form of invisible grace," or "a sign of a sacred thing." The sacraments he principally has in view are those of baptism and the Lord's Supper, but with so wide a definition there was nothing to prevent him from using the word (as he freely does) in many other applications. The old Sacramentaries or liturgical books, which can in some cases be carried back as far as to the 8th century, in like manner contain prayers and benedictions, not only for the administration of the Eucharist and of baptism, but also for a variety of other rites, such as the blessing of holy water and the dedication of churches. In the *De sacramentis Christianæ fidei* of Hugh of St

Victor (d. 1141), no fewer than thirty sacraments are enumerated, divided into three classes, baptism and the Lord's Supper occupying a first place. What proved to be an important new departure was taken by Peter Lombard (d. 1164), in the 4th book of his *Sentences*, which treats "of sacraments and sacramental signs." There for the first time are enumerated the seven sacraments (baptism, confirmation, the Eucharist, penance, extreme unction, order, matrimony), which were afterwards formally recognized by the Church of Rome at the councils of Florence (1439) and of Trent; and there also for the first time it was expressly recognized that not all signs of sacred things can be regarded as sacraments, but only those which are the form of invisible grace in such a sense as to represent it and bring it about ("ut ipsius imaginem gerat et causa existat"). This "differentia" of the sacrament, properly so called, became the basis of all subsequent scholastic discussion and authoritative decree in the Western church, and even, though of course indirectly, in the Eastern also. The main points in the Tridentine doctrine are these: the sacraments have the power of conferring grace *ex opere operato* on the recipients who do not resist it ("non ponentibus obicem"); for their validity, however, there must be in the minister the intention of doing that which the church does. Though all are in a sense necessary, they are not so with equal directness for each individual, nor are they alike in dignity. The two principal sacraments are baptism and the Lord's Supper. All were instituted by Christ. Three of them (baptism, confirmation, order) impart an indelible "character," and therefore cannot be repeated. For the teaching of the Greek Church compare vol. xi. pp. 158, 159. The churches of the Reformation, while retaining the current doctrine that sacraments were "effectual signs of grace and God's good will" "ordained by Christ," reduced their number to two, the remaining five being excluded partly because direct evidence of their institution by Christ was wanting, and partly because "they have not any visible sign or ceremony ordained of God." For further details on the individual sacraments the reader is referred to the separate articles (BAPTISM, EUCHARIST, &c.).

SACRAMENTO, a city of the United States, the capital of California and the county seat of Sacramento county, 135 miles by rail north-east of San Francisco on the east bank of the Sacramento river, which at this point receives the American river and becomes navigable for large steamboats. The site is only 15 feet above low water of the river, or 30 above sea-level, and as the river sometimes rises 20 feet the city was originally subject to destructive floods. Those of 1850, 1852, and 1853, however, led to the raising of the level of the principal streets and buildings in the business quarter by 5 feet, and to the construction of strong levees or embankments, from 4 to 20 feet high for 2 miles along the Sacramento and 3 along the American river. Further measures of the same kind were adopted after the disaster of 1861, which almost rendered the city bankrupt; and the level of the principal districts is now 8 feet above the river. The shops and stores in the city are mostly of brick, but the dwelling-houses generally only of wood. The State capitol, commenced in 1861 and completed at a cost of \$2,500,000, is one of the finest buildings of its kind in the States; it stands in the heart of the city in the midst of a park of 50 acres. The other public buildings—the State printing-office and armoury, the agricultural hall, the Oddfellows' hall, the hospital, the grammar-school, &c.—are comparatively unimportant. Besides the State library (36,000 volumes) there are two other public libraries in the city. The number of industrial establishments has recently been rapidly increasing; they comprise the extensive workshops of the Central Pacific

Railroad, a woollen-mill, carriage-factories, plough-factories, marble-works, breweries, potteries, glue-works, &c. The population was 6820 in 1850, 13,785 in 1860, 16,283 in 1870 (6202 foreigners, 1370 Chinese), and 21,420 in 1880 (7048 foreigners, 1781 Chinese).

In 1841 John Augustus Sutter (b. 1803), a Swiss military officer, obtained a grant of land at the junction of the Sacramento and American rivers, and made a settlement which he called New Helvetia. The discovery of gold on his property in 1848 changed the whole history of California. Sutter's Fort, as the spot was popularly called, became the site of a mining town, which was made the capital of the State in 1854, and obtained a city charter in 1863. The name of Sacramento was first applied to the place in the advertisement for the sale of ground-lots in 1848.

SACRIFICE. The Latin word *sacrificium*, from which we have the English "sacrifice," properly means an action within the sphere of things sacred to the gods, so that "sacrificial" and "hierurgic" are synonymous, and, strictly speaking, cover the whole field of sacred ritual. By the Romans, as by all ancient or primitive nations, the gods were habitually approached with gifts, and the presentation of the gift, being the central feature in every ordinary act of worship, is regarded as the sacrifice proper. In all parts of the world, moreover, for reasons which will appear by and by, the stated gifts by which the gods are honoured in private worship or public feasts are drawn from the stores on which human life is supported,—fruits, grain, wine, oil, the flesh of animals, and the like. All gifts of this kind, which are not merely presented to the god but consumed in his service, fall under the notion of sacrifice, while permanent votive offerings of treasure, lands, temples, images, or the like, not forming part of any stated ritual, are excluded. But again, where we find a practice of sacrificing honorific gifts to the gods, we usually find also certain other sacrifices which resemble those already characterized inasmuch as something is given up by the worshippers to be consumed in sacred ceremony, but differ from them inasmuch as the sacrifice—usually a living victim—is not regarded as a tribute of honour to the god, but has a special atoning or mystic significance. The most familiar case of this second species of sacrifice is that which the Romans distinguished from the *hostia honoraria* by the name of *hostia piacularis*. In the former case the deity accepts a gift; in the latter he demands a life. The former kind of sacrifice is offered by the worshipper on the basis of an established relation of friendly dependence on his divine lord; the latter is directed to appease the divine anger, or to conciliate the favour of a deity on whom the worshipper has no right to count. The precise scope of sacrifices not merely honorific will appear more clearly in the sequel; for the history of religion this second kind of sacrifice has a very peculiar importance, as may be judged from the fact that the ordinary metaphorical use of "sacrifice" in English answers not to the notion of a "gift" but to that of "reluctant surrender."¹

Honorific Sacrifices naturally hold the chief place in all natural (as opposed to positive) religions that have reached the stage in which orthodox ritual is differentiated from sorcery (comp. *PRIEST*, vol. xix. p. 724), and in which the relations between the gods and their worshippers are conceived as being of a fixed and habitually friendly character, so that the acts by which a continuance of divine favour can be secured are known by well-established tradition and regularly practised with full confidence in their efficacy. Religions of this type unite the god to a definite circle of

¹ Apart from this metaphorical use the word "sacrifice" in English is often taken as synonymous with "victim," bloodless oblations being called rather by the vague word "offering." This usage corresponds to the practice of the Authorised Version, which commonly renders זֶבַח וְנִסְחָה, i.e., "victim and cereal oblation," by the words "sacrifice and offering," and uses the verb "to sacrifice" for the Hebrew זָבַח, "to slaughter a victim."

worshippers forming a natural unity, so that every man's birth or political and social status determines at once what god he is called upon to worship and may confidently look to for help. Religions of this sort, therefore, are mainly tribal or national, and the deity is regarded as a king, or, if there are several gods worshipped by the same circle, they are lords and ladies and are naturally to be honoured in the same way as earthly grandees. Thus among the Hebrews, whose early institutions afford a typical example of a national religion, the fundamental rule is that no one is to appear before Jehovah empty-handed (Exod. xxiii. 15), just as it would be indecent (and in the East is still indecent) to approach a king or great man without some present, however trifling. In like manner Homer teaches that gods and kings alike are persuaded by gifts. A special request will naturally be accompanied by a special gift proportioned to the occasion or by a vow to be fulfilled when the prayer is heard; but apart from this the general goodwill whether of god or king falls to be acknowledged and secured by offerings renewed from time to time by way of tribute or homage. Thus in Hebrew the word *mincha* means alike "gift," "tribute," and "sacrificial oblation," especially an oblation of agricultural produce. For in a simple agricultural society payments in kind, whether to a divine or to a human lord, would naturally consist for the most part of the fruits of the soil; and with this it agrees that not only in Canaan but among the Greeks there is evidence that cereal oblations had a great place in early ritual, though they afterwards became second in importance to animal sacrifices, which yielded a more luxurious sacrificial banquet, and also, as we shall see, derived a peculiar significance from the shedding of the victim's blood. In almost all nations we find that the chief sacrificial feasts are associated with the harvest and the vintage, or, where pastoral life predominates, are regulated by the time at which the flocks bear their young (comp. PASSOVER); at these seasons tribute of firstfruits and firstlings is paid to the gods of the good things which they themselves have given to the inhabitants of their land. This conception of sacrifice may go with very various views of the nature of the gods and of religion. It may go with the idea that the god has need of the worshipper and his gifts just as the worshipper has need of the god and his help, and thus with a matter-of-fact business-like people like the Romans religion may become very much a sort of bargain struck with the gods. But, on the other hand, it is quite possible that sacrifices may continue to be offered by men who have ceased to believe that the deity has any need of what man can give, simply because such gifts are in ordinary life the natural expression of respect and homage and no fitter and more expressive way of giving utterance to the same feelings towards the gods has been devised. Thus the Hebrews continued to offer sacrifices to Jehovah long after they knew that "if He were hungry He would not tell man, for the world was His and the fulness thereof." But when this standpoint is reached sacrifice becomes a merely conventional way of expressing religious feeling; the ritual becomes a simple affair of tradition, which may, as in the Levitical legislation, be based on an express divine command; and those who are not content with the authority of tradition as a sufficient proof that the gods love to be honoured in this way take refuge in some allegorical explanation of the ceremonial. In general, however, we find an extraordinary persistence of the notion that sacrifices do in some way afford a physical satisfaction to the deity. If they do not feed him, he is at least gratified by their odour. Neither the Greek philosophers nor the Jewish rabbins ever quite got rid of this idea.

But in fact the notion that the more ethereal elements

of the sacrifice rise to heaven, the seat of the gods, in the savoury smoke that ascends from the sacrificial flame can in certain instances be shown to be connected with a later development of sacrifice. Among the Semites, for example, sacrifices were not originally burned. The god was not seated aloft, but was present at the place of sacrifice, inhabiting a sacred stone (a *baetylum*, beth-el, or "house of god"), which answered at once to the later idol and the later altar. That the god was thought by the heathen Semites to inhabit the sacred stone, or in other cases a sacred tree, is expressly recorded of several Arabian sanctuaries, and it cannot be doubted that this was the general view wherever there was a *massēba* (sacred cippus) or an *asherah* (sacred pole or tree). And in these cases the gift of the worshipper was not, in the more primitive cults, consumed by fire, but the sacred stone was daubed with oil or blood, libations of milk, of blood, or of wine were poured forth beside it, cereal gifts were presented by being simply laid on the sacred ground, and slaughtered victims were left there to be devoured by wild beasts (Sprenger, *Leb. Moh.*, iii. 457), or even a human sacrifice was offered by burying the victim under the cippus. Sacrifices of this type are found not only throughout the Semitic field but in all parts of the world; they belong to the same category with the Hebrew showbread and the Roman *lectisternia*. In later times the food spread on the tables of the god is eaten by his ministers, the priests, to whom he is supposed to make over the enjoyment of the banquet; but this is a refinement on the original usage. In older times the gods themselves were held to partake of these gifts of food, just as the venerable dead were fed by the meat and drink placed or poured out upon their tombs. In the religions of savages both gods and the dead have very material needs, among which the need of nourishment has the first place; and just as we learn from the story of Periander and Melissa (Herod., v. 92) that among the Greeks of the 7th century B.C. it was a new idea that the dead could make no use of the gifts buried with them unless they were etherealized by fire, so also the fact that among the Greeks, especially in old times, sacrifices to water-gods were simply flung into the river or the sea, and sacrifices to underground gods were buried, indicates that it is a secondary idea that the gods were too ethereal to enjoy a sacrifice through any other sense than that of smell. Even the highest antique religions show by unmistakable signs that in their origin sacrifices were literally "the food of the gods." In Israel the conception against which the author of Psalm i. protests so strongly was never eliminated from the ancient technical language of the priestly ritual, in which the sacrifices are called *אֵלֶּיָּהֶם*, "food of the deity" (Lev. xxi. 8, 17, 21); and among the Greeks we find not only such general expressions as that the gods "feast on hecatombs" (*Il.*, ix. 531) but even that particular gods bear special surnames, such as "the goat-eater," the "ram-eater," "Dionysus the eater of raw (human) flesh" (*αἰγοφάγος, κριοφάγος, ὠμωστής*).

A sacrifice, therefore, is primarily a meal offered to the deity. In some of the cases already noticed, and in the case of holocausts or whole burnt-offerings, the sacrificial gift is entirely made over to the god; but ordinarily the sacrifice is a feast of which gods and worshippers partake together. If all sacrifices are not convivial entertainments, at least the tendency is to give to all feasts, nay to all meals, a sacrificial character by inviting the gods to partake of them (Athenæus, v. 19). Thus the Roman family never rose from supper till a portion of the food had been laid on the burning hearth as an offering to the Lares (Serv., *Ad Æn.*, i. 730; Ovid, *Fast.*, ii. 633); and a similar practice was probably followed in early Greece.¹ At all events

¹ See the discussion in Buchholz, *Homer. Realien*, II. ii. 213 sq.

the slaughter of an animal (which gave the meal a more luxurious and festal character, animal food being not in daily use with the mass of the agricultural populations of the Mediterranean lands) seems to have been always sacrificial in early Greece, and even in later times St Paul assumes that the flesh sold in the shambles would often consist of *εὐωλόθυστα*. Among the Semites sacrifice and slaughter for food are still more clearly identified; the Hebrews use the same word for both, and the Arabian invocation of the name of Allah over every beast killed for food is but the relic of a sacrificial formula. The part of the gods in such sacrificial meals was often very small, the blood alone (Arabia), or the fat and the thighs (*Il.*, i. 460), or small parts of each joint (*Od.*, xiv. 427), or the blood, the fat, and the kidneys (*Lev.* iii.). When the sacrifice was offered by a priest, he also naturally received a portion, which, properly speaking, belonged to the deity and was surrendered by him to his minister, as is brought out in the Hebrew ritual by the ceremonial act of waving it towards the altar (*Lev.* vii. 29 *sq.*). The thigh, which in Homeric sacrifice is burned on the altar, belongs in the Levitical ritual to the priest, who was naturally the first to profit by the growth of a conviction that the deity himself did not require to be fed by man's food.

The conception of the sacrifice as a banquet in which gods and men share together may be traced also in the accessories of sacred ritual. Music, song, garlands, the sweet odour of incense, accompany sacrifice because they are suitable to an occasion of mirth and luxurious enjoyment. Wine, too, "which cheereth gods and men" (*Judges* ix. 13), was seldom lacking in the vine-growing countries; but the most notable case where the sacrificial feast has the use of an intoxicant (or narcotic) as its chief feature is the ancient *soma* sacrifice of the old Aryans, where the gods are honoured by bowls of the precious draught which heals the sick, inspires the poet, and makes the poor believe that he is rich.

The sacrificial meal, with the general features that have been described, may be regarded as common to all the so-called nature-religions of the civilized races of antiquity,—religions which had a predominantly joyous character, and in which the relations of man to the gods were not troubled by any habitual and oppressive sense of human guilt, because the divine standard of man's duty corresponded broadly with the accepted standard of civil conduct, and therefore, though the god might be angry with his people for a time, or even irreconcilably wroth with individuals, the idea was hardly conceivable that he could be permanently alienated from the whole circle of his worshippers,—that is, from all who participated in a certain local (tribal or national) cult. But when this type of religion began to break down the sacrificial ritual underwent corresponding modifications. Thus we find a decline of faith in the old gods accompanied, not only by a growing neglect of the temples and their service, but also by a disposition to attenuate the gifts that were still offered, or to take every opportunity to cheat the gods out of part of their due,—a disposition of which Arabia before Mohammed affords a classical example. But, again, the decline of faith itself was not a mere product of indifference, but was partly due to a feeling that the traditional ritual involved too material a conception of the gods, and this cause, too, tended to produce modifications in sacrificial service. The Persians, for example (*Herod.*, i. 132; *Strabo*, xv. p. 732), consecrated their sacrifices with liturgical prayers, but gave no part of the victim to the deity, who "desired nothing but the life (or soul) of the victim." This, indeed, is the Roman formula of *piacular* as distinct from honorific offerings (*Macrob.*, iii. 5, 1),

and might be taken as implying that the Persians had ceased to look on sacrifices as gifts of homage; but such an explanation can hardly be extended to the parallel case of the Arab sacrifices, in which the share of the deity was the blood of the victim, which according to antique belief contained the life. For among the Arabs blood was a recognized article of food, and the polemic of *Ps.* i. 13 is expressly directed against the idea that the deity "drinks the blood of goats." And the details given in *Strabo* make it tolerably clear that Persian sacrifice is simply an example of the way in which the material gift offered to the deity is first attenuated and then allegorized away as the conception of the godhead becomes less crassly material. But on the other hand it is undoubtedly true that under certain conditions the notion of *piacular* sacrifice shows much greater vitality than that of sacrificial gifts of homage. When a national religion is not left to slow decay, but shares the catastrophe of the nation itself, as was the case with the religions of the small western Asiatic states in the period of Assyrian conquest, the old joyous confidence in the gods gives way to a sombre sense of divine wrath, and the acts by which this wrath can be conjured become much more important than the ordinary traditional gifts of homage. To this point we must return by and by.

It appears, then, that in the old national nature-religions the ordinary exercises of worship take the form of meals offered to the gods, and usually of banquets at which gods and worshippers sit down together, so that the natural bond of unity between the deity and his subjects or children is cemented by the bond of "bread and salt"—salt is a standing feature in the sacrifices of many races (*comp. Lev.* ii. 13)—to which ancient and unsophisticated peoples attach so much importance. That the god is habitually willing to partake of the banquet offered to him is taken for granted; but, if anything has occurred to alienate his favour, he will show it by his conduct at the feast, by certain signs known to experts, that indicate his refusal of the offered gift. Hence the custom of inspecting the *exta* of the victim, watching the behaviour of the sacrificial flame, or otherwise seeking an omen which proves that the sacrifice is accepted, and so that the deity may be expected to favour the requests with which the gift is associated.¹

In the religions which we have been characterizing all the ordinary functions of worship are summed up in these sacrificial meals; the stated and normal intercourse between gods and men has no other form. God and worshippers make up together a society of *commensals*, and every other point in their reciprocal relations is included in what this involves. Now, with this we must take the no less certain fact that throughout the sphere of the purely sacrificial religions the circle of common worship is also the circle of social duty and reciprocal moral obligations. And thus the origin of sacrificial worship must be sought in a stage of society when the circle of commensals and the circle of persons united to each other by sacred social bonds were identical. But all social bonds are certainly developed out of the bond of kindred, and it will be generally admitted that all national religions are developments or combinations of the worship of particular kins. It would seem, therefore, that the world-wide prevalence of sacrificial worship points to a time when the kindred group and the group of commensals were identical, and when, conversely, people of different kins did not eat and drink together.

At first sight it might appear that this amounts to the

¹ Hence in Roman ritual there is no inspection of the *exta* where the sacrifice is *piacular*, and so does not involve a meal offered to the deity.

proposition that all religious and civil societies of antiquity have the family as their type, and that the type of sacrifice is such a family meal as is found among the Romans. And this view would seem to be favoured by the frequent occurrence among ancient peoples of the conception that the deity is the father (progenitor and lord) of his worshippers, who in turn owe filial obedience to him and brotherly duty to one another. But in the present stage of research into the history of early society it is by no means legitimate to assume that the family, with a father at its head, is the original type of the circle of commensals. It is impossible to separate the idea of commensality from the fact so constantly observed in primitive nations, that each kindred has certain rules about forbidden food which mark it off from all other kindreds. And in a very large proportion of cases kindred obligations, religion, and laws of forbidden food combine to divide a child from his father's and unite him to his mother's kin, so that father and sons are not commensals. It is noteworthy that family meals are by no means so universal an institution as might be imagined *a priori*. At Sparta, for example, men took their regular meals not with their wives and children but in *syssitia* or *pheiditia*; and a similar organization of nations in groups of commensals which are not family groups is found in other places (Crete, Carthage, &c.). The marked and fundamental similarity between sacrificial worships in all parts of the globe makes it very difficult to doubt that they are all to be traced back to one type of society, common to primitive man as a whole. But the nearest approximation to a primitive type of society yet known is that based not on the family but on the system of totem stocks; and as this system not only fulfils all the conditions for the formation of a sacrificial worship, but presents the conception of the god and his worshippers as a circle of commensals in its simplest and most intelligible form, it seems reasonable to look to it for additional light on the whole subject. In totemism and in no other system laws of forbidden food have a direct religious interpretation and form the principal criterion by which the members of one stock and religion are marked off from all their neighbours. For the totem is usually an animal (less often a plant); the kindred is of the stock of its totem; and to kill or eat the sacred animal is an impiety of the same kind with that of killing and eating a tribesman. To eat the totem of a strange stock, on the other hand, is legitimate, and for one totem group to feast on the carcass of a hostile totem is to express their social and religious particularism in the most effective and laudable way, to honour their own totem and to cast scorn on that of the enemy. The importance attached to the religious feast of those who have the same laws about food, and are therefore habitual commensals, is more intelligible on this system than on any other.

Though the subject has not been completely worked out, there is a good deal of evidence, both from social and from religious phenomena, that the civilized nations of antiquity once passed through the totem stage (see FAMILY and MYTHOLOGY); it is at least not doubtful that even in the historical period sacred animals and laws of forbidden food based on the sacredness of animals, in a way quite analogous to what is found in totemism, were known among all these nations. Among the Egyptians the whole organization of the local populations ran on totem lines, the different villages or districts being kept permanently apart by the fact that each had its own sacred animal or herb, and that one group worshipped what another ate. And the sacrificial feast on the carcass of a hostile totem persisted down to a late date, as we know from Plutarch (*Is. et Osir.*, p. 380; comp. Alex. Polyh., ap. Eus., *Præp. Ev.*, lx. p. 432;

Diod. Sic., i. 89). Among the Semites there are many relics of totem religion; and, as regards the Greeks, so acute an observer as Herodotus could hardly have imagined that a great part of Hellenic religion was borrowed from Egypt if the visible features of the popular worship in the two countries had really belonged to entirely different types. To suppose that the numerous associations between particular deities and corresponding sacred animals which are found in Greece and other advanced countries are merely symbolical is a most unscientific assumption; especially as the symbolic interpretation could not fail to be introduced as a harmonizing expedient where, through the fusion of older deities under a common name (in connexion with the political union of kindreds), one god came to have several sacred animals. But originally even in Greece each kin had its own god or in later language its hero; so in Attica the Crioëis have their hero Crius (Ram), the Butadæ have Butas (Bullman), the Ægidæ have Ægeus (Goat), and the Cynidæ Cynus (Dog). Such heroes are real totem ancestors; Lycus, for example, had his statue in wolf form at the Lyceum. The feuds of clans are represented as contests between rival totems: Lycus the wolf flees the country before Ægeus the goat, and at Argos, where the wolf-god (Apollo Lycius) was introduced by Danaus, the struggle by which the sovereignty of the Danaids was established was set forth in legend and picture as following on the victory of a wolf (representing Danaus) over a bull (representing the older sovereignty of Gelanor); see Paus., ii. 19, 3 sq. That Apollo's sacrifices were bulls and rams is therefore natural enough; at the sanctuary of the wolf-Apollo at Sicyon indeed legend preserved the memory of a time when flesh was actually set forth for the wolves, as totem-worshippers habitually set forth food for their sacred animals,—though by a touch of the later rationalism which changed the wolf-god into Apollo the wolf-slayer (Lycocoonus) the flesh was said to have been poisoned by Apollo's direction in a way that even theological experts did not understand (Paus., ii. 9, 7). Such clear traces of the oldest form of sacrifice are necessarily rare, but the general facts that certain animals might not be sacrificed to certain gods, while on the other hand each deity demanded particular victims, which the ancients themselves explained in certain cases to be hostile animals, find their natural explanation in such a stage of religion as has just been characterized. The details are difficult to follow out, partly because most worships of which we know much were syncretistic, partly because the animals which the gods loved and protected were in later times often confused with the victims they desired, and partly because piacular and mystical sacrifices were on principle (as we shall see by and by) chosen from the class of victims that might not be used for the feasts of the gods. A single example, therefore, must here suffice to close this part of the subject. At Athens the goat might not be offered to the Athena on the Acropolis. Now according to legend Athena's worship was made Panathenaic by the Ægidæ or goat clan, and Athena herself was represented clad in the ægis or goat-skin, an attribute which denotes that she too was of the goat kin or rather had been taken into that kin when her worship was introduced among them.¹

Generally speaking, then, the original principle on which a sacrificial meal is chosen is that men may not eat what cannot be offered to their god (generalized in later syncretism to the rule that men may not eat things that can be offered to no god; Julian, *Orat.*, v. p. 176 C.); and that,

¹ The religious meaning of wearing the skin of an animal is identification with the animal. Examples will appear below; compare also the were-wolf superstitions (vol. xv. p. 90), where the same symbolism occurs. So too Pausanias (x. 81, 10) describes a representation of the bear-heroine Callisto reclining on a bear-skin couch.

conversely, acceptable offerings are the things which are eaten by predilection by that divine animal which in later times became the sacred symbol of the anthropomorphic god, or else victims are to be chosen which are sacred among a hostile tribe. The two principles may often coincide. Fierce mountain tribes who live mainly by harrying their neighbours in the plain will be wolves, lions, bears, while their enemies will naturally worship bulls, sheep, goats, like the Troglodytes on the Red Sea, who "gave the name of parent to no human being but to the bull and the cow, the ram and the ewe, because from them they had their daily nourishment" (Strabo, xvi. 4); and thus in cases like that of Argos the ultimate shape of the ritual may throw important light on the character of the early population. When by conquest or otherwise two such originally hostile nations are fused the opposing animal symbols will ultimately be found in friendly association: e.g., Artemis (in her various forms) is associated both with carnivora and with stags or domestic animals. The former is the original conception, as her sacrifices show. She is therefore, like the wolf-Apollo, originally the deity of a wild hunting tribe, or rather various carnivorous deities of such tribes have coalesced in her.

Human Sacrifices.—From these observations the transition is easy to those human sacrifices which are not piacular. It is perfectly clear in many cases that such sacrifices are associated with cannibalism, a practice which always means eating the flesh of men of alien and hostile kin. The human wolves would no more eat a brother than they would eat a wolf; but to eat an enemy is another matter. Naturally enough traces of cannibalism persist in religion after they have disappeared from ordinary life, and especially in the religion of carnivorous gods.¹ Thus it may be conjectured that the human sacrifices offered to the wolf-Zeus (Lycaeus) in Arcadia were originally cannibal feasts of a wolf tribe. The first participants in the rite were according to later legend changed into wolves (Lycaon and his sons); and in later times, as appears by comparing Plato (*Rep.*, viii. 15) with Pausanias (viii. 2), at least one fragment of the human flesh was placed among the sacrificial portions derived from other victims, and the man who ate it was believed to become a were-wolf. All human sacrifices where the victim is a captive or other foreigner may be presumed to be derived from cannibal feasts; but a quite different explanation is required for the cases, which are by far more numerous among people no longer mere savages, in which a father sacrifices his child or a tribe its fellow-tribesman. This case belongs to the head of piacular sacrifices.

Piacular Sacrifices.—Among all primitive peoples there are certain offences against piety (especially bloodshed within the kin) which are regarded as properly inexpiable; the offender must die or become an outlaw. Where the god of the kin appears as vindicator of this law he demands the life of the culprit; if the kinsmen refuse this they share the guilt. Thus the execution of a criminal assumes the character of a religious action. If now it appears in any way that the god is offended and refuses to help his people, it is concluded that a crime has been committed and not expiated. This neglect must be repaired, and, if the true culprit cannot be found or cannot be spared, the worshippers as a whole bear the guilt until they or the guilty man himself find a substitute. The idea of substitution is widespread through all early religions, and is found in honorific as well as in piacular rites; the Romans, for example, substituted models in wax or dough for victims

that could not be procured according to the ritual, or else feigned that a sheep was a stag (*cervaria ovis*) and the like. In all such cases the idea is that the substitute shall imitate as closely as is possible or convenient the victim whose place it supplies; and so in piacular ceremonies the god may indeed accept one life for another, or certain select lives to atone for the guilt of a whole community, but these lives ought to be of the guilty kin, just as in blood-revenge the death of any kinsman of the manslayer satisfies justice. Hence such rites as the Semitic sacrifices of children by their fathers (see MOLOCH), the sacrifice of Iphigeneia and similar cases among the Greeks, or the offering up of boys to the goddess Mania at Rome *pro familiarium sospitate* (Macrob., i. 7, 34). In the oldest Semitic cases it is only under extreme manifestations of divine wrath that such offerings are made (comp. Porph., *De Abst.*, ii. 56), and so it was probably among other races also; but under the pressure of long-continued calamity, or other circumstances which made men doubtful of the steady favour of the gods, piacular offerings might easily become more frequent and ultimately assume a stated character, and be made at regular intervals by way of precaution without waiting for an actual outbreak of divine anger. Thus the Carthaginians, as Theophrastus relates, annually sprinkled their altars with "a tribesman's blood" (Porph., *De Abst.*, ii. 28). But in advanced societies the tendency is to modify the horrors of the ritual either by accepting an effusion of blood without actually slaying the victim, e.g., in the flagellation of the Spartan lads at the altar of Artemis Orthia (Paus., iii. 16, 7; comp. Eurip., *Iph. Taur.*, 1470 sq.; 1 Kings xviii. 28), or by a further extension of the doctrine of substitution; the Romans, for example, substituted puppets for the human sacrifices to Mania, and cast rush dolls into the Tiber at the yearly atoning sacrifice on the Sublician bridge. More usually, however, the life of an animal is accepted by the god in place of a human life. This explanation of the origin of piacular animal sacrifices has often been disputed, mainly on dogmatic grounds and in connexion with the Hebrew sin-offerings; but it is quite clearly brought out wherever we have an ancient account of the origin of such a rite (e.g., for the Hebrews, Gen. xxii. 13; the Phœnicians, Porph., *De Abst.*, iv. 15; the Greeks and many others, *ibid.*, ii. 54 sq.; the Romans, Ovid, *Fasti*, vi. 162). Among the Egyptians the victim was marked with a seal bearing the image of a man bound, and kneeling with a sword at his throat (Plut., *Is. et Os.*, chap. xxxi.) And often we find a ceremonial laying of the sin to be expiated on the head of the victim (Herod., ii. 39; Lev. iv. 4 compared with xiv. 21).

In such piacular rites the god demands only the life of the victim, which is sometimes indicated by a special ritual with the blood (as among the Hebrews the blood of the sin-offering was applied to the horns of the altar, or to the mercy-seat within the veil), and there is no sacrificial meal. Thus among the Greeks the carcase of the victim was buried or cast into the sea, and among the Hebrews the most important sin-offerings were burnt not on the altar but outside the camp (city), as was also the case with the children sacrificed to "Moloch." Sometimes, however, the sacrifice is a holocaust on the altar (2 Kings iii. 27), or the flesh is consumed by the priests. The latter was the case with certain Roman piacula, and with those Hebrew sin-offerings in which the blood was not brought within the veil (Lev. vi. 25 sq.). Here the sacrificial flesh is seemingly a gift accepted by the deity and assigned by him to the priests, so that the distinction between a honorific and a piacular sacrifice is partly obliterated. But this is not hard to understand; for just as a blood-rite takes the place of blood-revenge in human justice, so an

¹ In the Roman empire human sacrifice was practised at not a few shrines down to the time of Hadrian; for examples the reader may refer to Porphyry, *De Abst.*, ii. 27, 54 sq., and to Clem. Alex., *Coh. ad Gentes*, p. 27.

offence against the gods may in certain cases be redeemed by a fine (e.g., Herod., ii. 65) or a sacrificial gift. This seems to be the original meaning of the Hebrew *āshām* (trespass-offering), which was a kind of atonement made partly in money (Lev. v. 15 sq.), but accompanied (at least in later times) by a sacrifice which differed from the sin-offering, inasmuch as the ritual did not involve any exceptional use of the blood. The ordinary sin-offerings in which the priests ate the flesh may be a compound of the *āshām* and the properly piacular substitution of life for life. The two kinds of atonement are mixed up also in Micah vi. 6 sq., and ultimately all bloody sacrifices, especially the whole burnt-offering (which in early times was very rare but is prominent in the ritual of the second temple), are held to have an atoning efficacy (Lev. i. 4, xvii. 11). There is, however, another and mystical sense sometimes associated with the eating of sin-offerings, as we shall see presently.

The most curious developments of piacular sacrifice take place in the worship of deities of totem type. Here the natural substitute for the death of a criminal of the tribe is an animal of the kind with which the worshippers and their god alike count kindred; an animal, that is, which must not be offered in a sacrificial feast, and which indeed it is impious to kill. Thus Hecate was invoked as a dog (Porph., *De Abst.*, iii. 17), and dogs were her piacular sacrifices (Plut., *Qu. Rom.*, iii.). And in like manner in Egypt the piacular sacrifice of the cow-goddess Isis-Hathor was a bull, and the sacrifice was accompanied by lamentations as at the funeral of a kinsman (Herod., ii. 39, 40). This lamentation at a piacular sacrifice is met with in other cases, e.g., at the Argean festival at Rome (Marquardt, *Röm. Staatsverw.*, iii. 192), and is parallel to the marks of indignation which in various atoning rituals it is proper to display towards the priest who performs the sacrifice. At Tenedos, for example, the priest was attacked with stones who sacrificed to Bacchus a bull-calf, the affinity of which with man was indicated by the mother-cow being treated like a woman in childbirth and the victim itself wearing the cothurnus. As the cothurnus was proper to Bacchus, who also was often addressed in worship and represented in images as a bull, the victim here is of the same race with the god (*Æl.*, *H.N.*, xii. 34; Plut., *Qu. Gr.*, xxxv.) as well as with the worshippers. In such rites a double meaning was suggested: the victim was an animal kindred to the sacrificers, so that his death was strictly speaking a murder, for which, in the Attic Diipolia, the sacrificial axe cast away by the priest was tried and condemned (Paus., i. 24, 4), but it was also a sacred animal sharing the nature of the god, who thus in a sense died for his people. The last point comes out clearly in the annual sacrifice at Thebes, where a ram was slain and the ram-god Amen clothed in his skin. The worshippers then bewailed the ram and buried him in a sacred coffin (Herod., ii. 42). Thus the piacular sacrifice in such cases is merged in the class of offerings which may be called sacramental or mystical.

Mystical or Sacramental Sacrifices.—That the mysteries of races like the Greeks and Egyptians are sprung from the same circle of ideas with the totem mysteries of savage tribes has been suggested in MYTHOLOGY, vol. xvii. p. 151, with which the reader may compare Mr Lang's book on *Custom and Myth*; and examples of sacramental sacrifices have been adduced in the same article (p. 150) and in MEXICO, vol. xvi. p. 212. In Mexico the worshippers ate sacramentally paste idols of the god, or slew and feasted on a human victim who was feigned to be a representative of the deity. The Mexican gods are unquestionably developed out of totems, and these sacraments are on one line with the totem mysteries of the ruder Indian tribes

in which once a year the sacred animal is eaten, body and blood. Now according to Julian (*Orat.*, v. p. 175) the mystical sacrifices of the cities of the Roman empire were in like manner offered once or twice a year and consisted of such victims as the dog of Hecate, which might not be ordinarily eaten or used to furnish forth the tables of the gods. The general agreement with the American mysteries is therefore complete, and in many cases the resemblance extends to details which leave no doubt of the totem origin of the ritual. The mystic sacrifices seem always to have had an atoning efficacy; their special feature is that the victim is not simply slain and burned or cast away but that the worshippers partake of the body and blood of the sacred animal, and that so his life passes as it were into their lives and knits them to the deity in living communion. Thus in the orgiastic cult of the bull-Bacchus the worshippers tore the bull to pieces and devoured the raw flesh. These orgies are connected on the one hand with older practices, in which the victim was human (Orpheus legend, Dionysus *Ὀμῆστος*), and on the other hand with the myth of the murder of the god by his kinsmen the Titans, who made a meal of his flesh (Clem. Al., *Coh. ad Gentes*, p. 12). Similar legends of fratricide occur in connexion with other orgies (the Corybantes; see Clement, *ut supra*); and all these various elements can only be reduced to unity by referring their origin to those totem habits of thought in which the god has not yet been differentiated from the plurality of sacred animals and the tribesmen are of one kin with their totem, so that the sacrifice of a fellow-tribesman and the sacrifice of the totem animal are equally fratricides, and the death of the animal is the death of the mysterious protector of the totem kin. In the Diipolia at Athens we have seen that the slaughter of the sacred bull was viewed as a murder, but "the dead was raised again in the same sacrifice," as the mystic text had it: the skin was sewed up and stuffed and all tasted the sacrificial flesh, so that the life of the victim was renewed in the lives of those who ate of it¹ (Theophr., in Porph., *De Abst.*, ii. 29 sq.).

Mystic sacrifices of this sacramental type prevailed also among the heathen Semites, and are alluded to in Isa. lxxv. 4 sq., lxxvi. 3, 17; Zech. ix. 7; Lev. xix. 26, &c.,² from which passages we gather that the victim was eaten with the blood. This feature reappears elsewhere, as in the piacular swine-offerings of the *Frates Arvales* at Rome, and possesses a special significance inasmuch as common blood means in antiquity a share in common life. In the Old Testament the heathen mysteries seem to appear as ceremonies of initiation by which a man was introduced into a new worship, i.e., primarily made of one blood with a new religious kinship, and they therefore come into prominence just at the time when in the 7th century B.C. political convulsions had shaken men's faith in their old gods and led them to seek on all sides for new and stronger protectors. The Greek mysteries too create a close bond between the *mystæ*, and the chief ethical significance of the Eleusinia was that they were open to all Hellenes and so represented a brotherhood wider than the political limits of individual states. But originally the initiation must have been introduction into a particular social community; Theophrastus's legend of the origin of the Diipolia is expressly connected with the adoption of the house of Sopatrus into the position of Athenian citizens. From this point of view the sacramental rites of mystical sacrifice are a form of blood-covenant, and serve the same purpose

¹ In the same way the Issedones honoured their parents by eating their dead bodies (Herod., iv. 26). The life was not allowed to go out of the family.

² For details see W. R. Smith, *Kinship and Marriage in Early Arabia*, p. 309.

as the mixing of blood or tasting of each other's blood by which in ancient times two men or two clans created a sacred covenant bond. In all the forms of blood-covenant, whether a sacrifice is offered or the veins of the parties opened and their own blood used, the idea is the same: the bond created is a bond of kindred, because one blood is now in the veins of all who have shared the ceremony. The details in which this kind of symbolism may be carried out are of course very various, but where there is a covenant sacrifice we usually find that the parties eat and drink together (Gen. xxxi. 54), and that the sacrificial blood, if not actually tasted, is at least touched by both parties (Xen., *Anab.*, ii. 2, 9), or sprinkled on both and on the altar or image of the deity who presides over the contract (Exod., xxiv. 6, 7).¹ A peculiar form which meets us in various places is to cut the animal in twain and make those who swear pass between the parts (Gen. xiii. 9 sq.; Jer. xxxiv. 18 sq.; Plut., *Qu. Rom.*, iii., &c.). This is generally taken as a formula of imprecation, as if the parties prayed that he who proved unfaithful might be similarly cut in twain; but, as the case cited from Plutarch shows that the victim chosen was a mystic one, it is more likely that the original sense was that the worshippers were taken within the mystic life.

Even the highest forms of sacrificial worship present much that is repulsive to modern ideas, and in particular it requires an effort to reconcile our imagination to the bloody ritual which is prominent in almost every religion which has a strong sense of sin. But we must not forget that from the beginning this ritual expressed, however crudely, certain ideas which lie at the very root of true religion, the fellowship of the worshippers with one another in their fellowship with the deity, and the consecration of the bonds of kinship as the type of all right ethical relation between man and man. And the piacular forms, though these were particularly liable to distortions disgraceful to man and dishonouring to the godhead, yet contained from the first germs of eternal truths, not only expressing the idea of divine justice, but mingling it with a feeling of divine and human pity. The dreadful sacrifice is performed not with savage joy but with awful sorrow, and in the mystic sacrifices the deity himself suffers with and for the sins of his people and lives again in their new life.

(w. R. S.)

The Idea of Sacrifice in the Christian Church.

There can be no doubt that the idea of sacrifice occupied an important place in early Christianity. It had been a fundamental element of both Jewish and Gentile religions, and Christianity tended rather to absorb and modify such elements than to abolish them. To a great extent the idea had been modified already. Among the Jews the preaching of the prophets had been a constant protest against the grosser forms of sacrifice, and there are indications that when Christianity arose bloody sacrifices were already beginning to fall into disuse; a saying which was attributed by the Ebionites to our Lord repeats this protest in a strong form, "I have come to abolish the sacrifices; and if ye do not cease from sacrificing the wrath of God will not cease from you" (Epiph., xxx. 16). Among the Greeks the philosophers had come to use both argument and ridicule against the idea that the offering of material things could be needed by or acceptable to the Maker of them all. Among both Jews and Greeks the earlier forms of the idea had been rationalized into the belief that the most appropriate offering to God is that of a pure and penitent heart, and among them both was the idea that

the vocal expression of contrition in prayer or of gratitude in praise is also acceptable. The best instances of these ideas in the Old Testament are in Psalms l. and li., and in Greek literature the striking words which Porphyry quotes from an earlier writer, "We ought, then, having been united and made like to God, to offer our own conduct as a holy sacrifice to Him, the same being also a hymn and our salvation in passionless excellence of soul" (Euseb., *Dem. Ev.*, 3). The ideas are also found both in the New Testament and in early Christian literature: "Let us offer up a sacrifice of praise to God continually, that is, the fruit of lips which make confession to His name" (Heb. xiii. 15); "That prayers and thanksgivings, made by worthy persons, are the only perfect and acceptable sacrifices I also admit" (Just. Mart., *Trypho.*, c. 117); "We honour God in prayer, and offer this as the best and holiest sacrifice with righteousness to the righteous Word" (Clem. Alex., *Strom.*, vii. 6).

But among the Jews two other forms of the idea expressed themselves in usages which have been perpetuated in Christianity, and one of which has had a singular importance for the Christian world. The one form, which probably arose from the conception of Jehovah as in an especial sense the protector of the poor, was that gifts to God may properly be bestowed on the needy, and that consequently alms have the virtue of a sacrifice. Biblical instances of this idea are—"He who doeth alms is offering a sacrifice of praise" (Ecclus. xxxii. 2); "To do good and to communicate forget not, for with such sacrifices God is well pleased" (Heb. xiii. 16); so the offerings sent by the Philippians to Paul when a prisoner at Rome are "an odour of a sweet smell, a sacrifice acceptable, well pleasing to God" (Phil. iv. 18). The other form, which was probably a relic of the conception of Jehovah as the author of natural fertility, was that part of the fruits of the earth should be offered to God in acknowledgment of His bounty, and that what was so offered was especially blessed and brought a blessing upon both those who offered it and those who afterwards partook of it. The persistence of this form of the idea of sacrifice constitutes so marked a feature of the history of Christianity as to require a detailed account of it.

In the first instance it is probable that among Christians, as among Jews, every meal, and especially every social meal, was regarded as being in some sense a thank-offering. Thanksgiving, blessing, and offering were co-ordinate terms. Hence the Talmudic rule, "A man shall not taste anything before blessing it" (*Tosephta Berachoth*, c. 4), and hence St Paul's words, "He that eateth, eateth unto the Lord, for he giveth God thanks" (Rom. xiv. 6; comp. 1 Tim. iv. 4). But the most important offering was the solemn oblation in the assembly on the Lord's day. A precedent for making such oblations elsewhere than in the temple had been afforded by the Essenes, who had endeavoured in that way to avoid the contact with unclean persons and things which a resort to the temple might have involved (Jos., *Antiq.*, xviii. 1, 5), and a justification for it was found in the prophecy of Malachi, "In every place incense is offered unto My name and a pure offering; for My name is great among the Gentiles, saith the Lord of hosts" (Mal. i. 11, repeatedly quoted in early Christian writings, e.g., *Teaching of the Twelve Apostles*, c. 14; Just. Mart., *Trypho.*, c. 28, 41, 116; Irenæus, iv. 17, 5).

The points in relation to this offering which are clearly demonstrable from the Christian writers of the first two centuries, but which subsequent theories have tended to confuse, are these. (1) It was regarded as a true offering or sacrifice; for in the *Teaching of the Twelve Apostles*, in Justin Martyr, and in Irenæus it is designated by each of the terms which are used to designate sacrifices in the

¹ In Greek ritual the identity of the covenant sacrifice with mystico-piacular rites is clearly brought out by the animals chosen and by other features in the ritual. See Schoemann, *Gr. Alt.*, p. 248 sq.

Old Testament. (2) It was primarily an offering of the fruits of the earth to the Creator; this is clear from both Justin Martyr and Irenæus, the latter of whom not only explicitly states that such oblations are continued among Christians but also meets the current objection to them by arguing that they are offered to God not as though He needed anything but to show the gratitude of the offerer (Iren., iv. 17, 18). (3) It was offered as a thanksgiving partly for creation and preservation and partly for redemption: the latter is the special purpose mentioned (*e.g.*) in the *Teaching of the Twelve Apostles*; the former is that upon which Irenæus chiefly dwells; both are mentioned together in Justin Martyr (*Trypho*, c. 41). (4) Those who offered it were required to be not only baptized Christians but also "in love and charity one with another"; there is an indication of this latter requirement in the Sermon on the Mount (Matt. v. 23, 24, where the word translated "gift" is the usual LXX. word for a sacrificial offering, and is so used elsewhere in the same Gospel, viz., Matt. viii. 4, xxiii. 19), and still more explicitly in the *Teaching*, c. 14, "Let not any one who has a dispute with his fellow come together with you (*i.e.*, on the Lord's day) until they have been reconciled, that your sacrifice be not defiled." This brotherly unity was symbolized by the kiss of peace. (5) It was offered in the assembly by the hands of the president; this is stated by Justin Martyr (*Apol.*, i. 65, 67), and implied by Clement of Rome (*Ep.*, i. 44, 4).

Combined with this sacrifice of the fruits of the earth to the Creator in memory of creation and redemption, and probably always immediately following it, was the sacred meal at which part of the offerings was eaten. Such a sacred meal had always, or almost always, formed part of the rites of sacrifice. There was the idea that what had been solemnly offered to God was especially hallowed by Him, and that the partaking of it united the partakers in a special bond both to Him and to one another. In the case of the bread and wine of the Christian sacrifice, it was believed that, after having been offered and blessed, they became to those who partook of them the body and blood of Christ. This "communion of the body and blood of Christ," which in early writings is clearly distinguished from the thank-offering which preceded it, and which furnished the materials for it, gradually came to supersede the thank-offering in importance, and to exercise a reflex influence upon it. In the time of Cyprian, though not before, we begin to find the idea that the body and blood of Christ were not merely partaken of by the worshippers but also offered in sacrifice, and that the Eucharist was not so much a thank-offering for creation and redemption as a repetition or a showing forth anew of the self-sacrifice of Christ. This idea is repeated in Ambrose and Augustine, and has since been a dominant idea of both Eastern and Western Christendom. But, though dominant, it has not been universal; nor did it become dominant until several centuries after its first promulgation. The history of it has yet to be written. For, in spite of the important controversies to which it has given birth, no one has been at the pains to distinguish between (i.) the theories which have been from time to time put forth by eminent writers, and which, though they have in some cases ultimately won a general acceptance, have for a long period remained as merely individual opinions, and (ii.) the current beliefs of the great body of Christians which are expressed in recognized formularies. A catena of opinions may be produced in favour of almost any theory; but formularies express the collective or average belief of any given period, and changes in them are a sure indication that there has been a general change in ideas.

It is clear from the evidence of the early Western liturgies that, for at least six centuries, the primitive conception

of the nature of the Christian sacrifice remained. There is a clear distinction between the sacrifice and the communion which followed it, and that which is offered consists of the fruits of the earth and not of the body and blood of Christ. Other ideas no doubt attached themselves to the primitive conception, of which there is no certain evidence in primitive times, *e.g.*, the idea of the propitiatory character of the offering, but these ideas rather confirm than disprove the persistence of those primitive conceptions themselves.

All Eastern liturgies, in their present form, are of later date than the surviving fragments of the earlier Western liturgies, and cannot form the basis of so sure an induction; but they entirely confirm the conclusions to which the Western liturgies lead. The main points in which the pre-mediæval formularies of both the Eastern and the Western Churches agree in relation to the Christian sacrifice are the following. (1) It was an offering of the fruits of the earth to the Creator, in the belief that a special blessing would descend upon the offerers, and sometimes also in the belief that God would be propitiated by the offerings. The bread and wine are designated by all the names by which sacrifices are designated (*sacrificia*, *hostiæ*, *libamina*, and at least once *sacrificium placationis*), and the act of offering them by the ordinary term for offering a sacrifice (*immolatio*). (2) The offering of bread and wine was originally brought to the altar by the person who offered it, and placed by him in the hands of the presiding officer. In course of time there were two important changes in this respect: (a) the offerings of bread and wine were commuted for money, with which bread and wine were purchased by the church-officers; (b) the offerings were sometimes handed to the deacons and by them taken to the bishop at the altar, and sometimes, as at Rome, the bishop and deacons went round the church to collect them.¹ (3) In offering the bread and wine the offerer offered, as in the ancient sacrifices, primarily for himself, but inasmuch as the offering was regarded as having a general propitiatory value he mentioned also the names of others in whom he was interested, and especially the departed, that they might rest in peace. Hence, after all the offerings had been collected, and before they were solemnly offered to God, it became a custom to recite the names both of the offerers and of those for whom they offered, the names being arranged in two lists, which were known as diptychs. Almost all the old rituals have prayers to be said "before the names," "after the names." It was a further and perhaps much later development of the same idea that the good works of those who had previously enjoyed the favour of God were invoked to give additional weight to the prayer of the offerer. In the later series of Western rituals, beginning with that which is known as the *Leonine Sacramentary*, this practice is almost universal. (4) The placing of the bread and wine upon the altar was followed by the kiss of peace. (5) Then followed the actual offering of the gifts to God (*immolatio missæ*). It was an act of adoration or thanksgiving, much longer in Eastern than in Western rituals, but in both classes of rituals beginning with the form "Lift up your hearts," and ending with the *Ter Sanctus* or *Trisagion*.² The early MSS. of Western rituals indicate the importance which was attached to this part of the liturgy by the fact of its being written in a much more ornate way than the other parts, *e.g.*, in gold uncial letters

¹ Of this proceeding an elaborate account exists in the very interesting document printed by Mabillon in his *Museum Italicum* as "Ordo Romanus I."; the small phials of wine which were brought were emptied into a large bowl, and the loaves of bread were collected in a bag.

² The elements of the form are preserved exactly in the liturgy of the Church of England.

upon a purple ground, as distinguished from the vermilion cursive letters of the rest of the MS. With this the sacrifice proper was concluded. (6) But, since the divine injunction had been "Do this in remembrance of Me," the sacrifice was immediately followed by a commemoration of the passion of Christ, and that again by an invocation of the Holy Spirit (*epiclesis*) that He would make the bread and wine to become the body and blood of Christ. Of this invocation, which is constant in all Eastern rituals, there are few, though sufficient, surviving traces in Western rituals.¹ Then after a prayer for sanctification, or for worthy reception, followed the Lord's Prayer, and after the Lord's Prayer the communion.

In the course of the 8th and 9th centuries, by the operation of causes which have not yet been fully investigated, the theory which is first found in Cyprian became the dominant belief of Western Christendom. The central point of the sacrificial idea was shifted from the offering of the fruits of the earth to the offering of the body and blood of Christ. The change is marked in the rituals by the duplication of the liturgical forms. The prayers of intercession and oblation, which in earlier times are found only in connexion with the former offering, are repeated in the course of the same service in connexion with the latter. The designations and epithets which are in earlier times applied to the fruits of the earth are applied to the body and blood. From that time until the Reformation the Christian sacrifice was all but universally regarded as the offering of the body and blood of Christ. The innumerable theories which were framed as to the precise nature of the offering and as to the precise change in the elements all implied that conception of it. It still remains as the accepted doctrine of the Church of Rome. For, although the council of Trent recognized fully the distinction which has been mentioned above between the Eucharist and the sacrifice of the mass, and treated of them in separate sessions (the former in Session xiii., the latter in Session xxii.), it continued the mediæval theory of the nature of the latter. The reaction against the mediæval theory at the time of the Reformation took the form of a return to what had no doubt been an early belief,—the idea that the Christian sacrifice consists in the offering of a pure heart and of vocal thanksgiving. Luther at one period (in his treatise *De Captivitate Babylonica*) maintained, though not on historical grounds, that the offering of the oblations of the people was the real origin of the conception of the sacrifice of the mass; but he directed all the force of his vehement polemic against the idea that any other sacrifice could be efficacious besides the sacrifice of Christ. In the majority of Protestant communities the idea of a sacrifice has almost lapsed. That which among Catholics is most commonly regarded in its aspect as an offering and spoken of as the "mass" is usually regarded in its aspect as a participation in the symbols of Christ's death and spoken of as the "communion." But it may be inferred from the considerable progress of the Anglo-Catholic revival in most English-speaking countries that the idea of sacrifice has not yet ceased to be an important element in the general conception of religion. (E. H.A.)

SACRILEGE. The robbery of churches was in Roman law punishable with death. There are early instances of persons having suffered death for this offence in Scotland. In England at common law benefit of clergy was denied to robbers of churches. The tendency of the later law has been to put the offence of sacrilege in the same position as if the offence had not been committed in a sacred build-

ing. Thus breaking into a place of worship at night, says Lord Coke, is burglary, for the church is the mansion-house of Almighty God. The Larceny Act of 1861 punishes the breaking into or out of a place of divine worship in the same way as burglary, and the theft of things sacred in the same way as larceny. The breaking or defacing of an altar, crucifix, or cross in any church, chapel, or churchyard is an offence punishable with three months' imprisonment on conviction before two justices, the imprisonment to be continued unless the offender enter into surety for good behaviour at quarter sessions (1 Mary, sess. 2, c. 3).

SACRO BOSCO, JOHANNES DE, or JOHN HOLYWOOD, astronomical author, died 1244 (or 1256) as professor of mathematics at the university of Paris. Nothing else is known about his life. He wrote a treatise on spherical astronomy, *Tractatus de Sphæra Mundi*, first printed at Ferrara in 1472, and reprinted, generally with copious notes and commentaries, about sixty times until the end of the 17th century. About the year 1232 he wrote *De anni ratione seu ut vocatur vulgo computus ecclesiasticus*, in which he points out the increasing error of the Julian calendar, and suggests a remedy which is nearly the same as that actually used under Gregory XIII. three hundred and fifty years later.

SACY, ANTOINE ISAAC, BARON SILVESTRE² DE (1758-1838), the greatest of French Orientalists and the founder of the modern school of Arabic scholarship, was the second son of a Parisian notary, and was born at Paris on 21st September 1758. From the age of seven years, when he lost his father, he was educated in more than monastic seclusion in the house of his pious and tender mother. Designed for the civil service, he studied jurisprudence, and in 1781 got a place as counsellor in the *cour des monnaies*, in which he continued till, in 1791, he was advanced to be a commissary-general in the same department. De Sacy had a natural turn for business and liked variety of work, while he seems to have had little or no need of absolute repose. He had successively acquired all the Semitic languages while he was following the usual course of school and professional training, and while he was engaged in the civil service he found time to make himself a great name as an Orientalist by a series of publications which, beginning with those Biblical subjects to which his education and sympathies naturally directed his first Semitic studies, gradually extended in range, and already displayed the comprehensive scholar who had chosen the whole Semitic and Iranian East for his domain.³ The works of these early years do not show the full maturity of his powers; his chief triumph was an effective commencement of the decipherment of the Pahlavi inscriptions of the Sasanian kings (1787-91). It was the French Revolution which gained De Sacy wholly for letters. As a good Catholic and a staunch royalist he felt constrained in 1792 to retire from the public service, and lived in close seclusion in a cottage near Paris till in 1795 he was called to be professor of Arabic in the newly founded school of living Eastern languages. The years of retirement had not been fruitless; they were in part devoted to the study of the religion of the Druses, which continued to occupy him throughout life and was the subject of his last and unfinished work, the *Exposé de la Religion des Druses* (2 vols., 1838). Nevertheless, when called to be a

² His father's name was Silvestre, the addition De Sacy he took as a younger son after a fashion then common with the Parisian *bourgeoisie*.

³ A communication to Eichhorn on the Paris MS. of the Syro-Hexaplar version of IV. Kings formed the basis of a paper in the latter's *Repertorium*, vol. vii. (1780). This was De Sacy's literary début. It was followed by text and translation of the letters of the Samaritans to Jos. Scaliger (*ibid.*, vol. xiii., 1783) and by a series of essays on Arabian and Persian history in the *Recueil* of the Academy of Inscriptions and in the *Notices et Extraits*.

¹ It is found, e.g., in the second of Mone's masses from the Reichenau palimpsest, and in Mabillon's *Missale Gothicum*, No. 12; it is expressly mentioned by Isidore of Seville as the sixth element in the Eucharistic service, *De Offic. Eccles.*, i. 15.

teacher, he felt that he had himself much to learn. Since the death of Reiske Arabic learning had been in a backward state, the standard of philological knowledge was low, and the books for students extremely defective. De Sacy set himself with characteristic thoroughness to complete his own knowledge and supply the lacking helps to others, and he accomplished this task on such a scale, with such width of range, precision of thought, and scrupulous attention to details, that he became the founder of a wholly new school and the father of all subsequent Arabists. His great text-books, the *Grammaire Arabe* (2 vols., 1st ed. 1810, 2d ed. 1831) and the *Chrestomathie* (3 vols., 1st ed. 1806, 2d ed. 1826-31), together with its supplement, the *Anthologie Grammaticale* (1829), are works that can never become obsolete; the luminous exposition of the grammar and the happy choice of the pieces in the chrestomathy—all inedita—with the admirable notes, drawn from an enormous reading in MS. sources, make them altogether different from ordinary text-books. The whole powers of a great teacher, the whole wealth of knowledge of an unrivalled scholar, are spent with absolute singleness of purpose for the benefit of the learner, and the result is that the books are equally delightful and instructive to the student and to the advanced scholar. A comparison of the first and second editions shows how much toil and research it cost the author to raise his own scholarship to the level which, thanks to his work, has become the starting-place for all subsequent ascents of the Arabian Parnassus.

De Sacy's place as a teacher was threatened at the outset by his conscientious refusal to take an oath of hatred to royalty. He tendered his resignation both as professor and as member of the Institute; but he was allowed to continue to teach, and rejoined the Institute on its reorganization in 1803. In 1805 he made the only considerable journey of his life, being sent to Genoa on a vain search for Arabic documents supposed to lie in the archives of that city. In 1806 he added the duties of Persian professor to his old chair, and from this time onwards—as, in spite of his royalist opinions, he was ready to do public service under any stable government—his life, divided between his teaching, his literary work, and a variety of public duties, was one of increasing honour and success, broken only by a brief period of retreat during the Hundred Days. He found time for everything: while his pen was ever at work on subjects of abstruse research, he was one of the most active leaders in all the business which the French system throws on the *savans* of the capital, especially as perpetual secretary of the Academy of Inscriptions (from 1832); in 1808 he entered the *corps législatif*; and in 1832, when quite an old man, he became a peer of France and was regular in the duties of the chamber.¹ In 1815 he became rector of the university of Paris, and after the second restoration he was active on the commission of public instruction. Of the *Société Asiatique* he was one of the founders, and when he was inspector of Oriental types at the royal printing press he thought it his duty to read a proof of every book printed in Arabic and Persian. With this he maintained a vast correspondence and was accessible not only to every one who sought his advice on matters of learning and business but to all the poor of his quarter, who came to him as a member of the *bureau* of charity. Yet he was neither monk nor hermit: he enjoyed society and was happy in forty-eight years of married life and in the care of a large family. Though small and to appearance of delicate frame, De Sacy enjoyed unbroken health and worked on without sign of failing powers till two days before his death (21st February 1838), when he suddenly fell down in the street and never rallied.

¹ The title of baron he received from Napoleon in 1818.

De Sacy wrote so much that a list even of his larger essays, mostly communicated to the Academy or in the *Notices et Extraits*, is impossible in this place, while his lesser papers and reviews in the *Allg. Bib. f. biblische Litteratur*, the *Mines de l'Orient*, the *Magasin Encyclopédique*, the *Journal des Savants* (of which he was an editor), and the *Journal Asiatique* are almost innumerable. Among the works which he designed mainly for students may be classed his edition of Hariri (1822, 2d edition by Reinaud, 1847, 1855), with a selected Arabic commentary, and of the *Alfiya* (1833), and his *Calila et Dimna* (1816),—the Arabic version of that famous collection of Buddhist animal tales which has been in various forms one of the most popular books of the world. De Sacy's enquiry into the wonderful history of these tales forms one of his best services to letters and a good example of the way in which he always made his work for the benefit of learners go hand in hand with profound research. Of his continued interest in Biblical subjects he gave evidence in his memoir on the Samaritan Arabic version of the Pentateuch (*Mém. Acad. des Inscr.*, vol. xlix.), and in the Arabic and Syriac New Testaments edited for the British and Foreign Bible Society; among works important for Eastern history, besides that on the Druses already named, may be cited his version of Abd-Allatif, *Relation Arabe sur l'Égypte*, and his essays on the *History of the Law of Property in Egypt* since the Arab conquest (1805-18). And, in conclusion, it must not be forgotten that his oral teaching was not less influential than his writings, and that, except Ewald, almost all Arabists of chief note in the first half of this century, in Germany as well as in France, were his personal pupils. Of the brilliant series of teachers who went out from his lecture-room one or two veterans still survive, and Professor Fleischer's elaborate notes and corrections to the *Grammaire Arabe* (*Kleinere Schriften*, vol. i., 1885) may be regarded as the latest tribute to the memory of the great master by a disciple who is now the patriarch of living Arabists. (W. R. S.)

SACY, ISAAC LOUIS LE MAÎTRE DE (1613-1684), a figure of some prominence in the literary annals of PORT ROYAL (*g.v.*), and after the death of St Cyran (1643) and Singlin (1664) the leading confessor and "director" of the Jansenists in France, was born in Paris on 29th March 1613. He was closely connected with the Arnauld family, his true surname being Le Maître and that of Saci or Sacy which he afterwards assumed a mere anagram of Isaac, his Christian name. He studied philosophy and belles lettres at the Collège de Calvi-Sorbonne, and afterwards, under the influence of St Cyran (see DUVERGIER DE HAURANNE), his spiritual director, joined his eldest brother Antoine Le Maître at Port Royal des Champs. Here he threw himself heartily into the life of the place, devoting himself specially to teaching and the preparation of school-books, his chief productions in this class being expurgated editions of Martial and Terence and a translation of Phædrus. In 1650 he was ordained to the priesthood, and in 1654 he entered the field of theological controversy with a brochure entitled *Enluminures de l'Almanach des Jésuites intitulé la Déroute et la Confusion des Jansénistes*, of which it is enough to say that, if the Jesuit attack was in execrable taste, neither was the reply in keeping with the finer ethical tone of Port Royal. From 1661, after the breaking up of the Petites Écoles, he lived more or less in concealment in Paris until May 1666, when he was thrown into the Bastille, where he remained till November 1668. During his imprisonment he occupied himself with the completion of a new version of the New Testament, known as the *Nouveau Testament de Mons* (1667), and the remainder of his life was largely devoted to a similar translation of the Old Testament, based chiefly on the Vulgate, with *Éclaircissements*. These began to appear in 1672 and were continued down to the end of the minor prophets. As De Sacy knew nothing of Hebrew, this version is of no value as a contribution to scholarship, and in style it is more artificial and laboured than those which had preceded it. From 1668 till his death on 4th January 1684 he lived partly in Paris, partly at Port Royal des Champs, and partly at Pomponne, the seat of his cousin, the marquis de Pomponne. He was buried at Port Royal des Champs.

In addition to the works already mentioned, he published, under

the pseudonym of the "Sieur de Beuil," a French translation of the *De Imitatione Christi* (1662). He also translated Chrysostom's *Homilies on Matthew*. See Sainte-Beuve, *Port Royal*, bk. ii. chaps. 7, 18 (ed. 1878).

SADDLERY embraces the industries connected with the harnessing and controlling of all beasts of draught and burden. The materials used in harnessing the various creatures so employed and the modifications of harness necessary to suit their structure, temperament, and duties are, of course, exceedingly varied. In a restricted sense saddlery is principally a leather trade, and has to do with the harnessing of the horse. The craft has been recognized and established in England as a separate trade since the 13th century, when the London Saddlers' Company received its charter of incorporation from Edward I. There is evidence also of its early prosperity at Birmingham, where it grew to an importance which it still retains, the principal seat of the saddlery trade being now at Walsall near Birmingham, which is practically a saddlers' town. The trade divides itself into two branches, brown saddlery and black saddlery. The former is concerned with saddle-making and the cutting and sewing of bridles, reins, and all other uncoloured leather-work. The saddle is the most important article on the brown saddler's list. It consists of the tree or skeleton, on which the leather is stretched, the seat, the skirts, and the flaps. The tree is commonly made of beech strengthened with iron plates. The whole leather-work ought to be of pig-skin, but often the seat alone is of that material, the other parts being imitation, cleverly grained by means of electro-deposit copper casts from the surface of real pig-skin. There are many varieties of saddles, such as racing, military, hunting, and ladies' saddles, &c. A racing saddle may weigh not more than two or three pounds, while a cavalry saddle will be four times heavier. The saddle-maker has to consider the ease and comfort of both horse and rider. The saddle must fit closely and evenly to the curvature of the horse's back without tendency to shift, and it ought to offer as far as possible a soft and elastic seat for the rider. The black saddler is concerned with the harness of carriage, cart, and draught horses generally. The skill of the tradesman in this department is displayed in designing and arranging harness most favourable for the proper distribution of the load, and for bringing into use the muscles of the animal without chafing or fraying the skin. Much of the usefulness and comfort of a horse depends on the accurate and proper fit of its harness. The collar and traces and the saddle are the important features of draught harness, the former being the pieces through which the draught is effected, while dead weight is borne through the saddle. The portions of saddlery by which the horseman controls and guides the horse are the bridle and bit and the reins. Into the many devices connected with these and other parts of harness for curbing horses, for breaking them of evil habits, and for adding to the security of the equestrian and carriage traveller, we cannot here enter (compare *HORSEMANSHIP*, vol. xii. p. 198). Saddler's ironmongery forms an important feature of the trade. It embraces the making of buckles, chains, cart-gearing, stirrups, spurs, bits, hames, &c. The ornamental metal-work of carriage-harness is either electro-plated in silver or of solid polished brass.

SADDUCEES (צִדְקִיִּים, i.e., Zadokites), the party of the priestly aristocracy under the later Hasmonæans. The Sadducees were essentially a political party opposed to the Pharisees or party of the Scribes, and their position and history have therefore already been discussed in *ISRAEL*, vol. xiii. p. 424 sq. The common view that Sadduceism was essentially a philosophico-religious school is due partly to Josephus but mainly to later Jewish tradition, which

never could realize the difference between a nation and a sect, and fancied that the whole history of Israel was made up of such scholastic controversies as engrossed the attention of later times. The theological tenets of the Sadducees as they appear in the New Testament and in Josephus had a purely political basis. They detested the doctrine of the resurrection and the fatalism of the Pharisees because these opinions were used by their adversaries to thwart their political aims. The aristocracy suffered a great loss of position through the subjection of Judæa to a foreign power; but it was useless to urge political schemes of emancipation on those who believed with the Pharisees that Israel's task was to endure in patience till Jehovah redeemed the nation, and the resurrection rewarded those who had lived and died in bondage. In matters of ritual the Sadducees were naturally conservative, and their opposition to the unwritten traditions, from which they appealed to Scripture, is simply one phase of their opposition to Pharisaic innovations; for the traditions were the invention of the Pharisees and the written law represented old practice. When the Sadducees had lost all political importance their opposition to Pharisaism necessarily became more and more an affair of the schools rather than of practical life, but the Sadducees of the schools are only the last survival of what had once been a great political party.

SÁ DE MIRANDA, FRANCISCO DE (1495-1558), Portuguese poet, was born of noble family on 27th October 1495, at Coimbra, where also he received his education. He afterwards travelled in Spain and Italy, and held for some time a post at the court of John III. of Portugal. He died on his own property at Tapada near Ponte do Lima on 15th March 1558. Besides eight eclogues (six in Spanish and two in Portuguese), he wrote two comedies in Portuguese, — *Os Estrangeiros* and *Os Vilhalpandos*. See *PORTUGAL* (Literature), vol. xix. p. 556, and *SPAIN* (Literature).

SA'DÍ, generally called **MUŞLIH-UDDÍN**, but more correctly **MUSHARRIF-UDDÍN B. MUŞLIH-UDDÍN**, the greatest didactic poet and the most popular writer of Persia, was born about 1184 (580 A.H.) in Shiráz, where his father, 'Abdalláh, a man of practical religion and good common sense, who impressed upon his son from early childhood the great maxims of doing good and fearing nobody, was in the service of the Turkoman race of the Salgharides or Atábegs of Fárs. The fifth ruler of this dynasty, Sa'd b. Zengí, who ascended the throne in 1195 (591 A.H.), conceived a great affection for young Musharrif-uddín and enabled him, after the premature death of his father, to pursue his studies in the famous medreseh of Baghdád, the Nizámiyyah, where he remained about thirty years (1196-1224). Strict college discipline and severe theological studies repressed for a long time the inborn cheerfulness and joviality of his nature; but his poetical genius, which rapidly developed, kept alive in him, amid all the privations of an austere life, the elasticity of youth, and some of his "early odes," in which he praises the pleasures of life and the sweetness of love, were no doubt composed during his stay in Baghdád. At any rate his literary fame had already spread about 1210 (606 A.H.) as far as Káshgar in Turkistán, which the young poet (who in honour of his patron had assumed the name of Sa'dí) visited in his twenty-sixth or twenty-seventh year. After mastering all the dogmatic disciplines of the Islamitic faith he turned his attention first to practical philosophy, and later on to the more ideal tenets of Súfic pantheism, under the spiritual guidance of the famous sheikh Shiháb-uddín 'Umar Suhrawardí (died 1234; 632 A.H.). Between 1220 and 1225 he paid a visit to a friend in Ispahán, went from there to Damascus, and returned to Ispahán just at the time of the inroads of the Mongols, when the Atábeg Sa'd had been deposed by the victorious ruler of Kirmán,

Ghiyāth-uddīn (1223). Sadly grieved by the misfortune of his generous patron and disgusted with the miserable state to which Persia had been reduced, Sa'dī started in 1224 or 1225 on his way to India, thus entering on the second period of his life—that of his wanderings (1225-1255). He proceeded *via* Balkh, Ghaznī, and the Punjab to Gujrat, on the western coast of which he visited the famous shrine of Sīwa in Pattan-Sumanāt, and met with a remarkable adventure. Having seen the statue of the god lifting up its hands to heaven every morning at sunrise, he discovered that a priest, hidden behind the image, wrought the miracle by means of a cord; but, being caught in the very act of watching the performance, he had no alternative but to hurl his pursuer into a deep well and to escape at full speed,—not, however, until he had smashed the detested statue. After a prolonged stay in Delhi, where he acquired the knowledge of Hindūstānī which he afterwards turned to account in several of his poems—just as a number of excellent Arabic *kasidas* bear witness to his fluency in that idiom which he had learnt in Baghdād—he sailed for Yemen. In San'ā, the capital of Yemen, the loss of a beloved child (when he had married is not known) threw him into deep melancholy, from which only a new adventurous expedition into Abyssinia on the opposite African shore and a pilgrimage to Mecca and Medina could again rouse him. Thence he directed his steps towards Syria and lived as a renowned sheikh for a considerable time in Damascus, which he had once already visited. There and in Baalbec he added to his literary renown that of a first-rate pulpit orator. Specimens of his spiritual addresses are preserved in the five homilies (on the fugitiveness of human life, on faith and fear of God, on love towards God, on rest in God, and on the search for God) which usually form the second risālah or prose treatise in Sa'dī's complete works. At last weary of Damascus he withdrew into the desert near Jerusalem and led a solitary wandering life, till one day he was taken captive by a troop of Frankish soldiers, brought to Tripoli, and condemned to forced labour in the trenches of the fortress. After enduring countless hardships, he was eventually rescued by a rich friend in Aleppo, who paid his ransom, and moreover gave him his daughter in marriage. But Sa'dī, unable to live with his quarrelsome wife, set out on new travels, first to North Africa and then through the length and breadth of Asia Minor and the adjoining countries. Not until he had passed his seventieth year did he return to Shīrāz (about 1255; 653 A.H.). Finding the place of his birth tranquil and prosperous under the wise rule of Abūbākr b. Sa'd, the son of his old patron (1226-1260; 623-658 A.H.), the aged poet took up his permanent abode, interrupted only by repeated pilgrimages to Mecca, in a little hermitage outside the town, in the midst of a charming garden, and devoted the remainder of his life to Sūfī contemplation and poetical composition. Sa'dī died at Shīrāz in 1292 (691 A.H.) according to Ḥamdallāh Mustaufī (who wrote only forty years later), or in December 1291 (690 A.H.), at the age of 110 lunar years.

The experience of the world gained during his travels, his intimate acquaintance with the various countries he had visited, his insight into human character, its grandeur and its littleness, which a thirty years' intercourse with men of all ranks and of many nationalities had fully matured, together with an inborn loftiness of thought and the purest moral standard, made it easy for Sa'dī to compose in the short space of three years his two masterpieces, which have immortalized his name, the *Bustān* or "Fruit-garden" (1257) and the *Gulistān* or "Rose-garden" (1258), both dedicated to the reigning Atābeg Abūbākr. The former, also called *Sa'dnāma*, is a kind of didactic epopee in ten chapters and double-rhymed verses, which passes in review the highest philosophical and religious questions, not seldom in the very spirit of Christianity, and abounds with sound ethical maxims and matchless gems of transcendental speculation. The latter is a prose work of a similar tendency in eight

chapters, interspersed with numerous verses and illustrated, like the *Bustān*, by a rich store of clever tales and charming anecdotes; it discusses more or less the same topics as the larger work, but has acquired a much greater popularity in both the East and the West, owing to its easier and more varied style, its attractive lessons of practical wisdom, and its numerous bon-mots. But Sa'dī's *Diwān*, or collection of lyrical poetry, far surpasses the *Bustān* and *Gulistān*, at any rate in quantity, whether in quality also is a matter of taste. Other minor works are the Arabic *kasidas*, the first of which laments the destruction of the Arabian caliphate by the Mongols in 1258 (656 A.H.); the Persian *kasidas*, partly panegyric, partly didactical; the *marāthī*, or elegies, beginning with one on the death of Abūbākr and ending with one on the defeat and demise of the last caliph, Mustāsim; the *mulanmā'āt*, or poems with alternate Persian and Arabic verses, of a rather artificial character; the *tarjī'āt*, or refrain-poems; the *ghazals*, or odes; the *shāhībiyyah* and *mukatta'āt*, or moral aphorisms and epigrams; the *rubā'īyyāt*, or quatrains; and the *mufrađdāt*, or distichs. Sa'dī's lyrical poems possess neither the easy grace and melodious charm of Ḥāfiz's songs nor the overpowering grandeur of Jelāl-uddīn Rūmī's divine hymns, but they are nevertheless full of deep pathos and show such a fearless love of truth as is seldom met with in Eastern poetry. Even his panegyrics, although addressed in turn to almost all the rulers who in those days of continually changing dynasties presided over the fate of Persia, are free from that cringing servility so common in the effusions of Oriental encomiasts.

The first who collected and arranged his works was 'Alī b. Ahmad b. Bisutūn (1326-1384; 726-784 A.H.). The most exact information about Sa'dī's life and works is found in the introduction to Dr W. Bachner's *Sa'dī's Aphorismen und Sinngedichte*, Strasburg, 1879 (a complete metrical translation of the epigrammatic poems), and in the same author's "Sa'dī Studien," in *Z.D.M.G.*, xxx. pp. 81-106. Sa'dī's *Kulliyāt* or complete works have been edited by Harrington, Calcutta, 1791-95 (with an English translation of some of the prose treatises and of Daulat Shah's notice on the poet, of which a German version is found in Graf's *Zosengarten*, Leipzig, 1846, p. 229 sq.); for the numerous lithographed editions, see Rieu's *Pers. Cat. of the Brit. Mus.*, ii. p. 596. The *Bustān* has been printed in Calcutta (1810 and 1828), as well as in Lahore, Cawnpore, Tabriz, &c.; a critical edition with Persian commentary was published by K. H. Graf at Vienna in 1850 (German metrical translations by the same, Jena, 1850, and by Schlehta-Wsehrd, Vienna, 1852; English translation by W. Clarke, London, 1879; French translation by Barbier de Meynard, Paris, 1880). The best editions of the *Gulistān* are by A. Sprenger (Calcutta, 1851) and by Platts (London, 1874); the best translations into English by Eastwick (1852) and by Platts (1878); into French by Defrémery (1858); into German by Graf (1846); see also S. Robinson's *Persian Poetry for English Readers*, 1883, pp. 245-366. Select *kasidas*, *ghazals*, elegies, quatrains, and distichs have been edited, with a German metrical translation, by Graf, in the *Z.D.M.G.*, ix. p. 92 sq., xii. p. 82 sq., xiii. p. 445 sq., xv. p. 541 sq., and xviii. p. 570 sq. On the Sūfī character of Sa'dī in contrast to Ḥāfiz and Jelāl-uddīn Rūmī, comp. Ethé, "Der Sūfismus und seine drei Hauptvertreter," in *Morgenländische Studien*, Leipzig, 1870, pp. 95-124. (H. E.)

SADLER, SIR RALPH (1507-1587), English statesman, was the son of Henry Sadler, steward to the proprietor of the manor of Gillney, near Great Hadham, Hertfordshire, and was born at Hackney in Middlesex in 1507. While a mere child he obtained a situation in the family of Thomas Cromwell, earl of Essex. Through him he was introduced to Henry VIII., who conferred on him various appointments and employed him in connexion with the dissolution of the monasteries, in the rich spoils of which he was a large sharer. So much was the king impressed by Sadler's ability and address that he made choice of him for his subsequent important negotiations with Scotland. In 1537 he was sent thither to strengthen the English interest; in 1539-40 he was commissioned to persuade the Scottish king James V. to cast off the supremacy of the pope; in 1541 he went back to enforce the same counsel; and in 1542 he was appointed to settle the proposed match between Edward prince of Wales and Mary the infant queen of Scots. Although not successful in any of these missions, he continued to retain the full confidence of the king, who, in recognition of his zealous services, conferred on him in 1543 the honour of knighthood. On Henry's death in 1547 Sadler's name was found in the royal will as one of the councillors to the sixteen nobles who were entrusted with the guardianship of the young king. In the same year he was appointed treasurer to the army sent against Scotland, and for his great services in rallying the repulsed cavalry he was created a knight-banneret on the battlefield of Pinkie. During the reign of Mary he lived in retirement on his estate near Hackney; but on the accession of Elizabeth in 1558 he came once more into a sphere of active employment. He immediately became a member of parliament for the county of Hertford and a privy councillor.

Not long afterwards his strong Protestant sympathies and his acquaintance with Scottish affairs recommended him as a fit person to be employed by Elizabeth in her intrigues with the Scottish lords of the congregation against Queen Mary. In 1584 he was appointed keeper of Mary queen of Scots in the castle of Tutbury; but on account of "age and infirmity" he was permitted to resign his charge some time before the death of the queen. His last service was to repair to Scotland to pacify the king's indignation on account of Mary's death. He died after his return home at Standon in Hertfordshire, 30th March 1587.

The *Letters and Negotiations* of Sir Ralph Sadler were published at Edinburgh in 1720, and a more complete collection under the title *State Papers and Letters of Sir Ralph Sadler*, with a life by Sir Walter Scott, in 1809. *The Memoir of the Life and Times of Sir Ralph Sadleir*, by his Descendant Major F. Sadleir Stoney, appeared in 1877.

SADOLETO, JACOPO (1477-1547), Italian humanist and churchman, was born at Modena in 1477, and, being the son of a noted jurist, was designed for the same profession. He gave himself, therefore, to humanistic studies and acquired reputation as a Latin poet, his best-known piece being one on the group of Laocoon. Passing to Rome, he obtained the patronage of Cardinal Carafa and adopted the ecclesiastical career. Leo X. chose him as his secretary along with Peter Bembo, and in 1517 made him bishop of Carpentras. Sadoleto had a remarkable talent for affairs and approved himself a faithful servant of the papacy in many difficult negotiations under successive popes, especially as a peacemaker; but he was no bigoted advocate of papal authority, and the great aim of his life was to win back the Protestants by peaceful persuasion—he would never countenance persecution—and by putting Catholic doctrine in a conciliatory form. Indeed his chief work, a *Commentary on Romans*, though meant as a prophylactic against the new doctrines, gave great offence at Rome and Paris. Sadoleto was a diligent and devoted bishop and always left his diocese with reluctance even after he was made cardinal (1536). His piety and tolerant spirit, combined with his reputation for scholarship and eloquence and his diplomatic abilities, give him a somewhat unique place among the churchmen of his time. He died in 1547. His collected works appeared at Mainz in 1607, and include, besides his theologico-irenical pieces, a collection of *Epistles*, a treatise on education (first published in 1533), and the *Phædrus*, a defence of philosophy, written in 1538.

SAFES. A safe is any repository in which valuable property is guarded against risk of loss by fire or from the attacks of thieves. The protection of valuable documents and possessions was only imperfectly effected in the charter-rooms of old mansions and in the iron-bound oaken chests and iron coffers of the Middle Ages; but these in their day represented the strong rooms and safes of modern times. The vast increase in realized wealth and the complication of financial and banking operations necessitate in our days the greatest attention to the safeguarding of securities and property. The ingenuity of inventors has, within practicable limits, effected much in safe-making; but the cunning of thieves has increased in proportion to the obstacles to be overcome and to the value of the booty at which they aim. No safe can be held to be invulnerable; for, whatever human ingenuity can put together and close, the same ingenuity can tear down and open. An impregnable safe would indeed be a source of greater danger than of security to its owner, for, were the key or other means of access lost or rendered unworkable, the contents of the safe would of necessity be irrecoverable. The efficiency of a safe, therefore, does not depend on absolute impregnability, but on the nature of the obstacles it presents to

successful attack, and to the generally unfavourable conditions under which such attacks are made. It is common to make safes both thief- and fire-resisting, and the conditions necessary for the one object to a certain extent conduce to the attainment of both; but for many purposes security from the one danger alone is requisite.

The devices for baffling thieves are numerous. The safe must in the first place be made heavy and unwieldy, or otherwise it must be so fixed that it can only be carried away with the utmost difficulty. Next, the greatest obstacles to obtaining illegitimate access must be presented. To prevent fracturing a tough metal must be used in the construction, and to resist penetration by drilling metal of great hardness must be interposed. These conditions are commonly met by making the outer casing of the safe of boiler plate, backed by a lining of hard steel, over which is an inner lining of thin boiler plate, the three layers being securely bolted together by screws from within. By some makers a layer of hard metal is poured, in a fluid state, between the outer and inner casing; others case-harden one surface; and there are numerous additional devices for securing the combination of hardness and toughness. To prevent wrenching of joints, the two sides with top and bottom of the outer shell are sometimes made out of a single plate welded at the joint, and the back and front are then attached to that shell by angle irons screwed from within. The frame upon which the door hangs and into which the bolts shoot is made of great strength, with special precautions to prevent the wrenching off of the door by means of crowbars or wedges. In an ordinary safe the massive bolts, three or more in number, shoot only at the front, and fixed dogs or sham bolts fit into slots at the back or hinged side. This arrangement is sufficient to keep the door closed independent of hinges, which are merely the pivot on which the door turns. In all Chubb's safes bolts shoot both to front and back; and in the higher quality of that and of every other good maker bolts shoot on every side,—front, back, top, and bottom. Ordinarily the bolts shoot straight into the slot as in an ordinary lock; but, to defy wrenching, additional grip is secured by Chatwood, who makes a bolt with a clutch or projection, which falls into a recess in the slot and thus holds against any direct wrench. In Chubb's finer safes the bolts shoot diagonally all round, so that in each face of the door they go in two different directions. Safe bolts are shot not by the key, as in an ordinary lock, but by the door handle, and the key simply secures them in their position. By this arrangement, patented by Mr Charles Chubb in 1835, a series of the most ponderous bolts can be secured in locked position by a small key which can be carried in the vest pocket. The lock of a safe must be a careful piece of mechanism, not subject to derangement, unpickable, and gunpowder-proof. The portion of the door on which it is fastened is generally provided with extra precautions against drilling. A safe being well made and securely locked remains vulnerable through the medium of the key, which may be surreptitiously obtained either for direct use or to form a mould by which false keys can be cut. On this account, keyless locks and time locks are coming into great favour in America. In keyless permutation locks, such as those of Hall, Sargent, Yale, and Dalton, the bolts can be withdrawn only after an indicator has been successively set against a combination of numbers arranged before the closing of the door; and in the time lock of these inventors the safe can only be opened at any hour to which the time controller is set before closing. Electrical arrangements have also been attached to safes by which signals are conveyed to any spot when a safe so guarded is unlawfully interfered with.

It is much easier to render a safe fire-proof than to

guard it against burglary. It requires nothing more than a calculation of the intensity and duration of any fire to which it is likely to be exposed, and the provision of a sufficient lining of fire-resisting material. What is principally used is a mixture of some absorbent medium—such as sawdust, powdered gypsum or cement, or infusorial earth—with ground alum. Asbestos, silicate cotton, mica, and other non-conductors are also used; and by some makers sealed tubes of alkaline salts are distributed through the absorbent material. These burst when exposed to high heat and their contents saturate the surrounding substance. A carefully packed shell of not less than $3\frac{1}{2}$ inches of the fire-resisting medium should line the interior of every fire-proof safe; but in many cheap safes a quantity of brick dust is the only fire-resisting medium.

Where an ordinary safe provides insufficient accommodation the strong room takes its place. Such an apartment, being generally in the basement of a building, presents no special difficulties to make it proof against fire and thieves. Thickness of walls, built by preference of hard brick laid in cement, and liberal use of cement within the walls, as well as at the floor and over the arched roof, give strength against both fire and burglars. The interior of a strong room is generally lined with boiler-plate, and, in addition to the massive steel and iron door, it has an inner wrought-iron grill-door, which secures the vault during business hours and permits the ventilation of the apartment. Within such a strong room extra strong chambers or separate safes may be placed, and in this way precautions may be indefinitely multiplied.

The most complete examples of safe and strong-room arrangements are afforded by the public safes or safe-deposits erected in most of the great cities of America and in London. The premises of the National Safe Deposit Company in London consist of a large isolated building in Queen Victoria Street. The building, which is fire-proof, covers and surrounds the great safe vault or citadel, which is sunk in the ground to a depth of 45 feet. The vault itself, founded on a bed of concrete 20 feet in thickness, has walls, 3 feet thick, of hard blue brick laid in cement, with an external lining of fire-brick, and is lined internally with cast-iron plates $4\frac{1}{2}$ inches thick chilled on one side, the plates having embedded in them a network of strong interlaced wrought-iron bars. The vault is divided into four tiers or stories with eight separate compartments in each, which, after business hours, are closed with doors raised and lowered by hydraulic power. These doors, which each weigh four tons, are built up, 12 inches thick, of combinations of hard and tough metal to resist fracture and drilling, and when they are raised for business purposes the entrance to each compartment is protected by a massive wrought-iron grill. Within the thirty-two compartments there is space for about 20,000 safes of various sizes, which are let to owners of valuables, each renter having the sole control of the safe hired by him. Additional security is obtained by the patrol of armed watchmen, and generally it may be said that in the institution precautions have been carried almost to the pitch of perfection, if indeed they have not been pushed to needless excess. (J. P.A.)

SAFETY LAMP. See COAL, vol. vi. p. 72 sq.

SAFFARIDS, a Persian dynasty of the 9th century. See MOHAMMEDANISM, vol. xvi. p. 586.

SAFFI (Asafi), a seaport of Morocco, with 6000 inhabitants, some commerce, and a famous shrine, the House of the Seven Sleepers, frequented by Moslem and Jewish pilgrims. See vol. xvi. p. 831.

SAFFLOWER, or **BASTARD SAFFRON** (*Carthamus tinctorius*), belongs to the natural order *Compositæ*; its flowers form the basis of the safflower dye of commerce. The plant is a native of the East Indies, but is cultivated in Egypt and to some extent in southern Europe. To obtain the dyeing principle—carthamine—the flowers are first washed to free them from a soluble yellow colouring matter they contain; they are then dried and powdered, and digested in an alkaline solution in which pieces of clean white cotton are immersed. The alkaline solution having been neutralized with weak acetic acid, the cotton is removed and washed in another alkaline solution. When this

second solution is neutralized with acid, carthamine in a pure condition is precipitated. Dried carthamine has a rich metallic green colour; it forms a brilliant but fugitive scarlet dye for silk, but is principally used for preparing toilet rouge. In 1884 there were imported into the United Kingdom 1794 tons of safflower, valued at £7109, almost the whole of which came from the East Indies.

SAFFRON (Arab. *zafarān*) is manufactured from the dried stigmas and part of the style of the saffron crocus, a cultivated form of *Crocus sativus*, L., the precise origin of which is unknown; for, though some of the wild forms (var. *Thomasii*, *Cartwrightianus*) are also employed for the manufacture of saffron, they differ in character from the cultivated type and are somewhat restricted in geographical range, while the cultivated form extends with little or no change through nearly ninety degrees of longitude (Spain to Kashmir) and twenty-five degrees of latitude (England to Persia). It is invariably sterile, unless artificially fertilized with the pollen of some of the wild varieties. The purple flower, which blooms late in autumn, is very similar to that of the common spring crocus, and the stigmas, which are protruded from the perianth, are of a characteristic orange-red colour. The Egyptians, though acquainted with the bastard safflower (see preceding article), do not seem to have possessed saffron; but it is named in Canticles iv. 14 among other sweet-smelling herbs. It is also repeatedly mentioned (*κρόκος*) by Homer, Hippocrates, and other Greek writers; and the word "crocodile" was long supposed to have been derived from *κρόκος* and *δειλός*, whence we have such stories as that "the crocodile's tears are never true save when he is forced where saffron groweth" (Fuller's *Worthies*). It has long been cultivated in Persia and Kashmir, and is supposed to have been introduced into China by the Mongol invasion. It is mentioned in the Chinese materia medica (*Pun tsaou*, 1552-78). The chief seat of cultivation in early times, however, was the town of Corycus (modern Korghoz) in Cilicia, and from this central point of distribution it may not improbably have spread east and west. According to Hehn, the town derived its name from the crocus; Raymond, on the other hand, with more probability, holds that the name of the drug arose from that of the town. It was cultivated by the Arabs in Spain about 961, and is mentioned in an English leech-book of the 10th century, but seems to have disappeared from western Europe till reintroduced by the crusaders. According to Hakluyt, it was brought into England from Tripoli by a pilgrim, who hid a stolen corm in the hollow of his staff. It was especially cultivated near Hinton in Cambridgeshire and in Essex at Saffron Walden (i.e., Saffron Woods, not Saffron Walled-in, as the canting crest of the town would imply), its cultivators being called "crokers." This industry, though very important in the 15th century, when English saffron commanded the highest prices on the Continent, appears to have died out about 1768.

Saffron was used as an ingredient in many of the complicated medicines of early times. According to Gerard "the moderate use of it is good for the head and maketh the senses more quicke and lively. It shaketh off heave and drowsy sleep and maketh a man mery." It appears to be really a stimulant and antispasmodic, though its powers are slight. It is scarcely ever employed by modern pharmacists unless for the mere coloration of other tinctures, or at most as a cordial adjunct to other medicines. That it was very largely used in cookery is evidenced by many writers; thus Laurenbergius (*Apparatus Plantarum*, 1632) makes the large assertion "In re familiari vix ullus est telluris habitatus angulus ubi non sit croci quotidiana usurpatio aspersi vel incocti cibis." The Chinese used also to employ it largely, and the Persians and Spaniards

still mix it with their rice. As a perfume it was strewn in Greek halls, courts, and theatres, and in the Roman baths. The streets of Rome were sprinkled with saffron when Nero made his entry into the city.

It was, however, mainly used as a dye. It was a royal colour in early Greek times, though afterwards perhaps from its abundant use in the baths, and as a scented salve, it was especially appropriated by the hetairæ. In ancient Ireland a king's mantle was dyed with saffron, and even down to the 17th century the "lein-croich," or saffron-dyed shirt, was worn by persons of rank in the Hebrides. In mediæval illumination it furnished, as a glaze upon burnished tinfoil, a cheap and effective substitute for gold. The sacred spot on the forehead of a Hindu pundit is also partly composed of it. Its main use in England was to colour pastry and confectionery,—hence "I must have saffron to colour the Warden pies" (*Winter's Tale*, act iv. sc. i.),—and it is still often added to butter and cheese. One grain of saffron rubbed to powder with sugar and a little water imparts a distinctly yellow tint to ten gallons of water. This colouring power is due to the presence of polychlorite, a substance whose chemical formula appears to be $C_{48}H_{60}O_{18}$, and which may be obtained by treating saffron with ether, and afterwards exhausting with water. Under acids it yields the following reaction—

Crocin, according to Watts, *Dict. of Chem.*, has a composition of $C_{29}H_{42}O_{15}$ or $C_{58}H_{42}O_{30}$. This crocin is a red colouring matter, and it is surmised that the red colour of the stigmas is due to this reaction taking place in nature.

At present saffron is chiefly cultivated in Spain, France, Sicily, on the lower spurs of the Apennines, and in Persia and Kashmir. The ground has to be thoroughly cleared of stones, manured, and trenched, and the corms are planted in ridges. The flowers are gathered at the end of October, in the early morning, just when they are beginning to open after the night. The stigmas and a part of the style are carefully picked out, and the wet saffron is then scattered on sheets of paper to a depth of 2 or 3 inches; over this a cloth is laid, and next a board with a heavy weight. A strong heat is applied for about two hours so as to make the saffron "sweat," and a gentler temperature for a further period of twenty-four hours, the cake being turned every hour so that every part is thoroughly dried. It is calculated that the stigmas of about 4800 flowers are required to give an ounce of saffron; but the experiments of Chappellier indicate a possibility of greatly increasing the yield by the cultivation of monstrous forms.

The drug has naturally always been liable to great adulteration in spite of penalties, the severity of which suggests the surviving tradition of its sacred character. Thus in Nuremberg a regular saffron inspection was held, and in the 15th century we read of men being burned in the market-place along with their adulterated saffron, while on another occasion three persons convicted of the same crime were buried alive. Grease and butter are still very frequently mixed with the cake and shreds of beef dipped in saffron water are also used. Good saffron is distinguished by its deep orange-red colour; if it is light yellow or blackish, it is bad or too old. It should also have a peculiar and rather powerful odour, and a bitter pungent taste. If oily it is probably adulterated with butter or grease.

See Flückiger and Hanbury, *Pharmacographia*, and Maw, *Monograph of the genus Crocus*, upon which the preceding account is essentially based; also Pereira, *Materia Medica*, and the pharmacopœias.

SAFFRON WALDEN, a market-town and municipal borough of Essex, England, is finely situated near the Cam in a valley surrounded by hills, on a branch of the Great Eastern Railway, 44 miles north-north-east of London and 14 south of Cambridge. It has a somewhat ancient appearance and possesses good streets and a spacious market-place. Of the old castle, dating probably from before the Conquest, the keep and a few other portions still remain. The church of St Mary the Virgin, a beautiful specimen of the Perpendicular style, dating from the reign of Henry VII., but frequently repaired and restored, contains the tomb of Lord Audley, chancellor to Henry VIII. There is an Edward VI. grammar-school, for which new buildings have recently been erected. Amongst the modern public

buildings are the corn exchange (1848) and the new town-hall (1879). The town possesses a museum, a literary institute, and a horticultural society. The benevolent institutions include the hospital and the Edward VI. almshouses. In the neighbourhood is the fine mansion of Audley End, built by Thomas, first earl of Suffolk, in 1603 on the ruins of the abbey, converted in 1190 from a Benedictine priory founded by Geoffrey de Mandeville in 1136. The town is an important centre of agricultural industry and has large corn, cattle, and sheep markets. Brewing and malting are carried on. The population of the municipal borough (area, 7416 acres) in 1871 was 5718, and in 1881 it was 6060.

The original name of the town was Wealdenberg, and when it received a grant of a market in the time of Geoffrey de Mandeville it was called Cheping Walden. The substitution of the prefix Saffron is accounted for by the former culture of SAFFRON (*q.v.*) in the neighbourhood. The town has existed for more than 500 years as a guild, and the government is now vested in a mayor, four aldermen, and twelve councillors.

SAGAN, a manufacturing town in Prussian Silesia, situated on the Bober, a tributary of the Oder, lies 60 miles south-south-east of Frankfurt-on-the-Oder and 102 miles south-east of Berlin. It contains the handsome palace of the dukes of Sagan, several interesting churches, a Roman Catholic gymnasium, and a large Gothic hospital, named after its founder, the duchess Dorothea (1793-1862). The leading industry of the town is cloth-weaving, with wool and flax spinning; it has also some trade in wool and grain. The population in 1880 was 11,373.

The mediate principality of Sagan, formed in 1397 out of a portion of the duchy of Glogau, has several times changed hands by purchase as well as by inheritance. One of its most famous possessors was Wallenstein, who held it for seven years before his death in 1634. Bought by Prince Lobkowitz in 1646, the principality remained in his family until 1786, when it was sold to Peter, duke of Courland, whose descendant, the duke of Talleyrand-Périgord and Valençay in France, now owns it. The area of the principality is about 467 square miles, and its population is about 65,000.

SAGAR, or **SAUGOR**, a British district of India, situated in the extreme north-west of the Central Provinces, and comprised between 23° 4' and 24° 27' N. lat., and between 78° 6' and 79° 12' E. long., with a total area of 4005 square miles. It is bounded on the N. by the Lalitpur district of the North-Western Provinces and the native states of Bijáwar, Panná, and Charkhári; on the E. by Panná and Damoh district; on the S. by Narsinhpur district and the native state of Bhopal; and on the W. also by Bhopal. Sagar district is an extensive, elevated, and in parts tolerably level plain, broken in places by low hills of the Vindhyan sandstone. It is traversed by numerous streams, chief of which are the Sunar, Beás, Dhupan, and Bina, all flowing in a northerly direction towards the valley of the Ganges. In the southern and central parts the soil is black, formed by decaying trap; to the north and east it is a reddish-brown alluvium. Iron ore of excellent quality is found and worked at Hirapur, a small village in the extreme north-east. The district contains several densely wooded tracts, the largest of which is the Ramna teak forest preserve in the north. Roads are the only means of communication; of these the total length is 134 miles, 50 being returned as first class. The climate is moderate; the average temperature is 75°, and the average rainfall is about 46 inches.

By the census of 1881 the population numbered 564,950 (294,795 males and 270,155 females). Hindus numbered 498,071, Mohammedans 25,396, Buddhists and Jains 16,432, Christians 1034, and aboriginals 19,144. The only town except the capital (see below) with a population exceeding 10,000 is Garhakota, which contains 11,414 inhabitants. Of the total area only 1396 square miles are cultivated, and of the portion lying waste 1220 are returned as cultivable. Wheat forms the principal crop, which is produced in large quantities all over the district; other products are food grains, rice, oil-seeds, cotton, and sugar-cane. Cattle and buffaloes are bred to a large extent both for draught and carriage, and also

for dairy purposes, especially for the manufacture of ghee. The revenue of Sagar district in 1883-84 amounted to £68,376, of which the land-tax contributed £44,429.

By a treaty concluded with Baji Rao in 1818, the greater part of the present district was made over to the British. During the mutiny of 1857 the whole district was in the possession of the rebels, excepting the town and fort, in which the Europeans were shut up for eight months, till relieved early in the following year by Sir Hugh Rose. The rebels were totally defeated and order was again restored by March 1858. Sagar was formed into a separate district of the Central Provinces in 1861.

SAGAR, principal town and headquarters of the above district, situated in 23° 50' N. lat. and 78° 49' E. long., is well built with wide streets and stands on the borders of a small but beautiful lake, and has military cantonments. Sagar is the entrepôt of the salt trade with Rájputána, and carries on a large trade with Mirzápur district in the North-Western Provinces, importing sugar and other grocery, besides English cloth. The population of the town in 1881 was 44,416 (males 22,556, females 21,860).

SAGE, LE. See LE SAGE.

SAGHALIN, or SAKHALIN, is the name improperly given to a large elongated island in the North Pacific, lying between 45° 57' and 54° 24' N. lat. and 141° 30' and 144° 50' E. long., off the coast of Russian Manchuria. Its proper name is *Karafutu*, or *Karafuto*. It is separated from the mainland by the narrow and shallow Strait of Tartary, which often freezes in winter in its narrower part, and from Yezo (Japan) by the Strait of La Pérouse. This island (670 miles long, 20 to 150 broad, with an area of 24,560 square miles), about equal in size to Belgium and Holland together, must be considered as a continuation of the mountains bordering the Manchurian littoral. Its orography is still imperfectly known. The present maps represent it as formed of two parallel ridges, running north and south and reaching from 2000 to 4000 or 5000 feet (Mounts Berniget and Ktöus-pal) high, with two or more wide depressions, not exceeding 600 feet above the sea. The general configuration of the littoral and the island, however, renders it more probable that there are three chains running south-west to north-east, forming continuations of those of the mainland. The geological structure of the island is also imperfectly known. A few crystalline rocks are found at several capes; Cretaceous limestones containing a rich and specific fauna of gigantic ammonites occur at Dui; and Tertiary conglomerates, sandstones, marls, and clays, folded by subsequent upheavals, are widely spread. The clays, which contain layers of good coal and a rich fossil vegetation, show that during the Miocene period Saghalin was part of a continent which comprised both north Asia, Alaska, and Japan, and enjoyed a much warmer climate than now. The Pliocene deposits contain a mollusc fauna more arctic than the present, and probably indicating that the connexion between the Pacific and Arctic Oceans was broader than now. Only two rivers, the Tym and the Poronai, are worthy of mention. The former, 250 miles long, and navigable by rafts and light boats for 50 miles from its mouth, flows north and north-east with numerous (about 100) rapids and shallows, in a wild valley suitable only for fishing or hunting settlements, and enters the Sea of Okhotsk at the Bay of Nyi. The Poronai flows north and then south to the Gulf of Patience, a wide bay on the south-east coast. Three other small streams enter the wide semicircular Gulf of Aniva at the southern extremity of the island.

Owing to the cooling influence of the Sea of Okhotsk, the climate is very cold. At Dui the average yearly temperature is only 33°·0 Fahr. (January, 3°·4; July, 61°·0), 35°·0 at Kusunai, and 37°·6 at Aniva (January, 9°·5; July, 60°·2). A dense covering of clouds for the most

part shuts out the rays of the sun; while the cold current issuing from the Sea of Okhotsk, aided by north-east winds, in summer brings immense ice-floes to the east coast. The whole of the island is covered with dense forests (mostly coniferous). The Ayan fir (*Abies ayanensis*), the Saghalin pichta, and the Daurian larch are the chief trees; and the upper parts of the mountains have the Siberian rampant cedar (*Cembra pumila*) and the Curilian bamboo (*Arundinaria kurilense*), 4 feet high and half an inch thick. Birch, both European and Kamchatkan (*B. alba* and *B. Ermani*), elder, poplar, elm, wild cherry (*Prunus padus*), *Taxus baccata*, and several willows are mixed with the Conifers; while farther south the maple, the ash, and the oak, as also the Japanese *Panax ricinifolium* and the Amur cork (*Philodendron amurense*), make their appearance. The number of phanerogamous species known reaches 590 and may reach 700, of which only 20 are peculiar to Saghalin, the remainder belonging to the Amur and partly to the Japanese flora. The fauna of Saghalin closely resembles that of the Amur region, and in fact the Siberian. Bears, foxes, and sables are still numerous, as also the reindeer in the north and the antelope; and tigers are occasionally met with in the south. The avifauna is the common Siberian; and the rivers are exceedingly rich in fish, especially species of salmon (*Oncorhynchus*), which make their way up the rivers in vast numbers to spawn. The lower marine fauna, explored by Schrenck, is also rich, while numerous whales, not in high esteem with whalers, are met with on the sea-coast. Otarias, seals, and dolphins are a source of profit.

Saghalin has been inhabited since at least the Neolithic Stone Age. Flint implements, exactly like those of Siberia and Russia, have been found at Dui and Kusunai in great numbers, as well as polished hatchets (of trap, diorite, and argillaceous schists)—also like the European ones—primitive pottery with decorations like those of Olonetz, and stone weights for nets. Afterwards came a population to whom bronze was known; they have left their traces in earthen walls and kitchen-middens (in the Bay of Aniva). The present inhabitants consist of some 2000 Gilyaks, 2500 Ainos, 500 Oroks, as many Japanese, and about 6000 Russians. The Gilyaks, who do not differ from those of the Amur, inhabit the northern part of the island. They support themselves by fishing and partly by hunting, but suffer from competition with the Japanese, who take possession of the best fishing-grounds. The Oroks, of Tungus origin, resemble the Orotchons of the Amur; they live by hunting. The Ainos, who are still the subject of so much discussion among ethnologists, are the aborigines of the island; they are closely akin to the Curilians, and, like these, differ from all other Mongolian races by their luxuriance of hair and beard. They now inhabit only the south part of the island, and have been brought into a condition of slavery by the Japanese, by whom they have been driven out of Yezo and Nippon, in both of which they were the aborigines. The Japanese have several colonies on Saghalin and force the Ainos to fish and to collect seaweed for exportation. They send their ships to the south part of the island and have colonies there, and also on the east coast, at the mouth of the Tym. The Russians began to settle permanently on Saghalin in 1857; and, though next year posts were established in the southern part of the island, it still continued to belong to Japan, which definitely ceded it to Russia in 1875. A scheme having been lately formed for colonizing the island with convicts, several thousands have been transported thither, especially to Dui (Alexandrovsk), where they are employed in coal-mining (annual output from 3000 to 30,000 cwts.), or make some attempt at agriculture; they are either kept in the Alexandrovsk prison, or permitted to build houses and to settle with their families. These efforts towards colonization, however, encounter great difficulties from the quality of the soil, the cultivable patches occurring here and there in the marshy valley of the Duika river, on the upper course of the Tym, and in the bays of Patience and Aniva. The only crops that thrive are various kinds of kitchen produce. The Russian settlements are at Dui on the west coast, Malo-Tymovsk and Rykovsk on the upper Tym, Korsakoff and Muravieff on the Bay of Aniva.

History.—Saghalin, which was under Chinese dominion until the present century, became known to Europeans from the travels of Martin Gerrits in the 17th century, and still better from those of La Pérouse (1787) and Krusenstern (1805), who described large parts of its coasts. Both, however, regarded it as a mere appendage of the continent, and were unaware of the existence of the Strait of

Tartary, which was discovered a few years later by a Japanese, Mamia Rinso, whose discovery is embodied in Siebold's *Nippon*. The Russian navigator Nevelskoi, in 1849, definitively established the existence and navigability of this strait; since that time the Russian expeditions of Boshnyak (1851) and Rimsky-Korsakoff (1853) continued the explorations, and in the latter year a Russian post was temporarily established at Aniva Bay. L. Schrenck in 1855-56, and MM. Schmidt, Glehn, Brylkin, and Shebunin in 1860, explored the geology, fauna, flora, and ethnology of the island; M. Lopatin in 1867 explored, on foot, the east coast; MM. Dobrotvorskij published (1869 and onwards) interesting data as to the inhabitants, and M. Polyakoff was entrusted in 1881-82 with a detailed exploration, and returned with rich ethnological and zoological collections, with regard to which only preliminary reports have as yet been published. (P. A. K.)

SAGINAW, a city of the United States, capital of Saginaw county, Michigan, lies on an elevated plateau about 30 feet above the water on the left bank of the Saginaw river, which falls into Saginaw Bay on Lake Huron, about 18 miles lower down. It is a railway junction of some importance, 100 miles north-west of Detroit, is connected with East Saginaw by a street railway, and can be reached by the largest vessels that ply on the lake. The upper branches of the river are also available for boat traffic throughout a considerable district. Saw-mills, planing-mills, and salt-works are the principal industrial establishments. The population was 7460 in 1870 and 10,525 in 1880. The city charter dates from 1859, the first settlement from 1822.

SAGITTA. The name "Sagitta" was given by Martin Slabber in 1775 to a small marine worm which is now known as the type of a distinct group, the *Chaetognatha* (Leuckart). The group comprises two genera (*Sagitta* and *Spadella*) and a considerable number of species; they are small transparent pelagic animals, varying in length from a few lines up to two inches, and are universally distributed. The body (see fig.) is elongated and furnished with a tail and lateral fins, which are prolongations of the chitinous cuticle; the head is provided with a great number of variously shaped chitinous setae. The body is divided by transverse septa into three distinct segments: the first septum is placed just behind the head (*st*), the second (*st*) about the middle of the body, separating the ovaries and testes. The body-cavity is likewise separated into right and left halves by a continuous vertical mesentery, which suspends the gut. The alimentary canal is a simple straight tube of uniform structure passing from the mouth to the anus, which is placed ventrally and at the second transverse septum; the alimentary tube is ciliated and is unprovided with glands of any kind. The body-wall is composed of (1) an outer layer of epidermis, which secretes the chitinous cuticle already referred to,—the thickness of the epidermis varying from five or six cells in the region of the head to a single layer of cells in the "fins"; (2) a delicate structureless supporting lamella; (3) a layer of longitudinal muscles. These last have a peculiar arrangement and structure: they are disposed in four bands, two dorsal and two ventral, the action of which is evidently favourable to producing the onward movements of the creature. The muscular fibres, which are transversely striated, are arranged in a series of lamellae whose direction is perpendicular to the longitudinal axis of the body. Projections inward of the supporting lamella bear on either side a single row of muscular fibres; a similar muscular structure occurs in the *Nematoidea* and in many *Oligochaeta*. In the anterior region of the body the muscular layer is differentiated into special muscles for the movement of the setae. (4) The body-cavity is lined by a delicate peritoneal epithelium closely applied to the muscular layer of the body-wall and to the gut. The nervous system consists of a cerebral ganglion and a large ventral ganglion—the two united by commissures which pass round the gut; both ganglia are embedded in the epidermis. This primi-

tive condition of the nervous system is retained in other lowly organized worms (e.g., *Polygordius*). The ventral ganglion is connected with an intra-epidermic nervous plexus which surrounds the whole body. Eyes are present, besides a number of tactile cells upon the outer surface of the body; anteriorly is a ring-shaped structure (*r*) which is supposed to be olfactory in function. The generative organs consist of ovaries and testes, which are united in the same individual; the ovaries (*e*), placed anterior to the testes, are furnished with oviducts, which appear to terminate in a caecal extremity. The testes (*ho*) are placed behind the second septum; they are each furnished with a vas deferens opening on to the exterior and into the body-cavity by a ciliated funnel. For embryology, see Balfour, *Comparative Embryology*, vol. i. p. 303.

In spite of the detailed knowledge which we now possess of the structure and development of the *Chaetognatha*, the systematic position of the group remains a matter of the greatest uncertainty. That they are an archaic group is shown by their hermaphroditism, by the primitive condition of the nervous system, and by the persistence of the vertical mesentery among other characters; in all these points and in others they agree with such primitive *Annelida* as *Protodrilus* and *Polygordius*. On the other hand, their similarity to the *Nematoidea* has been dwelt upon; the disposition of the muscles is the same in both groups, and the *Gordiacea* have the gut suspended by a dorsal and ventral mesentery in the same fashion as has been described above in *Sagitta*; the *Chaetognatha* differ, however, from the *Nematoidea* in the important fact of their segmentation. On the whole, it appears that the *Chaetognatha* are best regarded as a special phylum equivalent to such groups as *Annelida*, *Platyhelminthes*, *Nematoidea*, but having no special relation to any one of them.

SAGO is a food-starch prepared from a deposit in the trunk of several palms, the principal source being the sago palm, *Metroxylon Rumphii* (Mart.), and *M. lève* (Mart.). These palms are natives of the East Indian Archipelago, the sago forests being especially extensive in the island of Ceram. The trees flourish only in low marshy situations, seldom attaining a height of thirty feet, with a thick-set trunk. They attain maturity as starch-yielding plants at the age of about fifteen years, when the stem is gorged with an enormous mass of spongy medullary matter, around which is an outer rind consisting of a hard dense woody wall about two inches thick. When the fruit is allowed to form and ripen, the whole of this starchy core disappears, leaving the stem a mere hollow shell; and the tree immediately after ripening its fruit dies. When ripe the palms are cut down, the stems divided into sections and split up, and the starchy pith extracted and grated to a powder. The powder is then kneaded with water over a strainer, through which the starch passes, leaving the woody fibre behind. The starch settles in the bottom of a trough, in which it is floated, and after one or two washings is fit for use by the natives for their cakes and

Spadella cephaloptera
(Busch).

St, septa dividing body-cavity transversely; *g2*, cerebral ganglia; *n2*, commissure uniting this with ventral ganglion (not shown in fig.); *n2*, nerve uniting cerebral ganglia with small ganglia on head; *nr*, olfactory nerve; *d*, alimentary canal; *r*, olfactory organ; *te*, tentacle; *t*, tactile hairs springing from surface of body; *e*, ovary; *el*, oviduct; *ho*, testes; *sg*, vas deferens; *f2*, *f3*, lateral and caudal fins; *sb*, seminal pouch. The eyes are indicated as black dots behind the cerebral ganglia.

soups. That intended for exportation is mixed into a paste with water and rubbed through sieves into small grains, from the size of a coriander seed and larger, whence it is known according to size as pearl sago, bullet sago, &c. A large proportion of the sago imported into Europe comes from Borneo, and the increasing demand has led to a large extension of sago-palm planting along the marshy river banks of Sarawak.

Various palms, in addition to the two above named, yield sago, but of an inferior quality. Among them may be mentioned the Gomuti palm (*Arenga saccharifera*), the Kittul palm (*Caryota urens*), the cabbage palm (*Corypha umbraculifera*), besides *Corypha Gebanga*, *Raphia flabelliformis*, *Phoenix farinifera*, and *Metroxylon filare*—all East Indian palms—and *Mauritia flexuosa* and *Guilielma speciosa*, two South-American species. The imports of sago into the United Kingdom for 1884 amounted to 346,188 cwt., valued at £195,680, the whole of which, excepting less than 300 tons, is entered as coming from the Straits Settlements.

SAGUNTUM, an ancient city of Hispania Tarracensis, was situated near the mouth of the river Pallantias (Palancia). It was the centre of a fertile district and was a rich trading place in early times, but owes its celebrity to the desperate resistance it made to Hannibal (see vol. xi. p. 441). The Romans restored the city and made it a colony; later writers speak of its figs, which were esteemed at Rome, and of its earthenware, which enjoyed a certain reputation. The most important remains are those of the theatre.

The modern Sagunto or Murviedro (*muri veteres*), 18 miles by rail from Valencia on the line to Tarragona, is now about 3 miles from the sea; the population within the municipal boundaries was 6287 in 1877.

vol. i.,
Plate II.

SAHARA is the great desert region which stretches across the continent of Africa eastwards from the Atlantic for a considerable distance on both sides of the Tropic of Cancer, and is generally distinguished by aridity of soil, absence of running water, dryness of atmosphere, and comparative scarcity of vegetable and animal life. The physical limits of this region are in some directions marked with great precision, as in part of Morocco and Algeria, where the southern edge of the Atlas range looks out on what has almost the appearance of a boundless sea, and forms, as it were, a bold coast-line, whose sheltered bays and commanding promontories are occupied by a series of towns and villages—Tizgi, Figig, Laghouat, &c. In other directions the boundaries are vague, conventional, and disputed. This is especially the case towards the south, where the desert sometimes comes to a close as suddenly as if it had been cut off with a knife, but at other times merges gradually and irregularly into the well-watered and fertile lands of the Sudan (Soudan). While towards the east the valley of the Nile at first sight seems to afford a natural frontier, the characteristics of what is usually called the Nubian or Arabian desert are so identical in most respects with those of the Sahara proper that some authorities extend this designation over the whole country to the shores of the Red Sea. The desert, indeed, does not end with Africa, but is prolonged eastwards through Arabia towards the desert of Sind. As the Nubian region has been described under the heading NUBIA (vol. xvii. p. 610), attention will in the present article be confined to the desert country west of the Nile valley. Even as thus defined the Sahara is estimated to have an area of 3,565,565 square miles, or nearly as much as all Europe minus the Scandinavian peninsula and Iceland; but, while Europe supports a population of 327,000,000, the Sahara probably does not contain more than 2,500,000,—a figure, however, which is sufficiently startling to those who think of it as an uninhabitable expanse of sand. The sea-like aspect of certain portions of the Sahara has given rise to much popular misconception, and has even affected the ideas and phraseology of scientific writers. Instead of

being a boundless plain broken only by wave-like mounds of sand hardly more stable and little less dangerous than the waves of ocean, the Sahara is a region of the most varied surface and irregular relief, ranging in altitude from 100 feet below to some 5000 or 6000 or even it may be 8000 feet above the sea-level, and, besides sand-dunes and oases, containing rocky plateaus, vast tracts of loose stones and pebbles, ranges of hills of the most dissimilar types, and valleys through which abundant watercourses must once have flowed.

The culminating points of the Sahara are probably the summits of the Ahaggar (Hoggar), a great mountain plateau, not inferior to the Alps in the area which it covers, crossing the Tropic of Cancer about 5° and 6° E. long., almost midway between the Atlantic and the valley of the Nile. In its central mass rise with red steep cliffs two peaks, Watellen and Hikena, which Duveyrier believes to be volcanic like those of Auvergne. The height of this country has not been ascertained by direct European observation, but may be gathered from the fact that according to the Tuareg the snow lies for three months of the year, from December to March. To the north-west, and separated from the Atakor-'n-Ahaggar by a wide plain, rises the Muydir plateau, lying nearly east and west for a distance of about 200 miles. Its north-eastern extremity is extended towards Timassinin by the Irawen Mountains, which in their turn are separated by a narrow valley from the Tasili plateau (strictly Tasili of the Asjer or Asgar). This great plateau stretches south-east for 300 miles parallel with the Atakor-'n-Ahaggar (from which it is separated by the Amadghor and Adamar plains), and then the line of elevation is continued by low ridges to the Tummo or War Mountains, and so onwards to the highland country of Tibesti or Tu, whose highest point, Tusidde, is 7880 feet above the sea-level, while its south-eastern eminences gradually die away in the direction of Wadai and Darfor (Darfur). About midway between Tibesti and the Niger rises the isolated mountain mass of Air or Asben, in which Dr Erwin von Bary¹ discovered the distinct volcanic crater of Teginjir with a vast lava-bed down its eastern side. By some this country is assigned to the Sudan, as it lies within the limit of the tropical rains; but the districts farther south have all the characteristics of the desert. The low but extensive plateau of Adghagh lies between Air and the Niger. Away to the north-east, in the country of FÉZZAN (*q.v.*), are the dark mountains of Jebel es-Sôda, which are continued south-east towards Kufra by the similar range of the Haruj; and in the extreme south-west at no great distance from the Atlantic is the hilly country of Adrar (Aderer).

Nearly all the rest of the Sahara consists in the main of undulating surfaces of rock (distinguished as *hammada*), vast tracts of water-worn pebbles (*serir*), and regions of sandy dunes (variously called *maghter*, *erg* or *areg*, *igidi* and in the east *rhart*), which, according to M. Pomel, occupy about one-ninth or one-tenth of the total area. The following is the general distribution of the dunes. From the Atlantic coast to the south of Cape Blanco a broad belt extends north-east for a distance of about 1300 miles, with a breadth varying from 50 to 300 miles. This is usually called the Igidi or Gidi, from the Berber word for dunes. Eastward it is continued to the south of Algeria and Tunis by the Western Erg and the Eastern Erg, separated by a narrow belt at Golea. To the south of the Eastern Erg (which extends as far north as the neighbourhood of the Lesser Syrtis) the continuity of the sandy tract is completely broken by the Hammada al-Homra (or Red Rock Plateau), but to the south of this region lie the dunes of Edeyen, which, with slight inter-

¹ *Zeitschrift für Erdkunde*, 1880.

ruptions, extend to Murzuk (Morzúk). To the south of the hammada of Murzuk the dunes of Murzuk stretch away south-east. Looked at in its entirety, this series of tracts may be called the northern zone; it forms a kind of bow, with its extremities respectively at the Atlantic and the Libyan Desert and its apex in the south of Tunis. In the south are the Juf,¹ covering a vast area to the south-east of the middle portion of the Igidi, another area between the Adghagh plateau and the Tasili van Ahaggar, and a third between Air and Tibesti. Away to the east in the Libyan Desert is a vast region of dunes of unascertained limits. It must be borne in mind that the sands do not entirely cover the areas assigned to them in the ordinary maps, which are of too small a scale to show the interchange of different kinds of surface. In the Eastern Erg especially the dunes lie in long lines in a north-north-west and south-south-east direction, presenting a gradual slope to windward and an abrupt descent to leeward. There they are generally about 60 or 70 feet high, but in other parts of the Sahara they are said to attain a height of upwards of 300 feet. The true dune sand is remarkable for the uniformity of its composition and the geometrical regularity of its grains, which measure less than .03937 inch.² While individually these appear crystalline or reddish yellow (from the presence of iron), they have in the mass a rich golden hue. According to M. Tissandier's examination, animal organisms, such as the microscopic shells of *Rhipopoda*, so abundant in sea-sand, are strikingly absent. Under the influence of the wind the surface of the dunes is subject to continual change, but in the mass they have attained such a state of comparative equilibrium that their topographic distribution may be considered as permanent, and some of them, such as Gern (Peak) al-Shuf and Gern Abd-al-Kader, to the south of Golea, have names of their own. The popular stories about caravans and armies being engulfed in the moving sands are quite apocryphal, but there is abundant evidence against the theory of M. Vatonne as to the dunes having been formed *in situ*. To understand their origin it is necessary to glance at the general geology of the Sahara, which, however, in this aspect, is only known in detail to the south of Algeria and along the routes of the Rohlfs expedition (1873-74, Dr Zittel) and that of Dr Lenz (1880).

Granite, which, along with gneiss and mica schists, seems to be the prevailing rock in the highlands of Air (Von Bary), comes to the surface more or less sporadically in the neighbourhood of Al-Eglab and in the Adrar districts in the south-west. Gneiss and mica schists are probably the main materials of the Ahaggar plateau. Volcanic rocks (basalt, &c.) form the mountain masses of Jebel es-Sôda and the Haruj; in Air they break through the granite and other rocks in a very erratic fashion. Slates and quartzite (possibly Silurian, according to Lenz), which play so great a part in Senegambia, appear to the north of the Senegal, along the edge of the desert, and crop out again in Adrar, on the eastern borders of the Juf, and to the east of Wady Sus. An immense tract from Adrar north-east to the borders of Algeria seems to be occupied by Devonian and Carboniferous formations, the characteristic fossils of which frequently show on the surface; farther east these rocks are covered by Cretaceous and Quaternary deposits, though they again appear in the Muysir and Tasili plateaus (M. Roche's report³). The development of the Cretaceous system is altogether one of the most striking features of Saharan geology, its extreme limits being the coasts of the Atlantic and the Red Sea, and the area occupied by it in the Algerian Sahara alone being equal to the whole of France. In the Algerian Sahara the Cretaceous rocks are covered by no later sediments, with the exception of certain Quaternary deposits, but in the Libyan Desert Tertiary deposits are abundant, though, according to Zittel, there is no sharp distinction between Cretaceous and Tertiary, the one seem-

ing (certain palæological characteristics apart) to pass gradually into the other. Eocene limestones, rich in nummulites and operculines, stretch south and east from the oasis of Siwa and are well seen in the cliffs enclosing the depressed oasal areas which sink down to the Cretaceous rocks. To the south of Farafreh extends a vast tract of Nubian sandstone.

In all parts of the Sahara there is evidence of denudation carried out on a scale of unusual magnitude. The present surface of the desert has been exposed to the protracted wear and tear of the elements. But to determine the exact method by which the elements have done their work has hitherto proved beyond the power of science. The superficial observer is at once tempted to accept the theory of *submarine* denudation: the Sahara is still the "dried bed of a sea" in even such text-books as Professor Huxley's *Physiography* and Stanford's *Compendium of Geography*. The sand-dunes, the salt efflorescence and deposits, and the local occurrence of certain modern marine molluscs all go to help the hypothesis of a diluvial sea. But a more extensive acquaintance with Saharan characteristics shows that such a sea for the Sahara as a whole is impossible. The denudation must probably be explained as due to the combined action of fresh water and atmospheric agencies. Even at present the Sahara is not so destitute as has been supposed of fresh water. Though rain is one of the rarest phenomena of the lowlands, the mountains on its northern borders and the central highlands are both regions of precipitation, and discharge their surplus waters into the hollows. A glance at a good physical map of the Sahara shows in fact the skeleton of a regular river-system. From the north side of the Atakor-n-Ahaggar, for instance, begins Wady Igharghar, which, running northwards between the Tasili plateau and the Irawen Mountains, appears to lose itself in the sands of the Eastern Erg, but can be distinctly traced northwards for hundreds of miles. Its bed contains rolled fragments of lava and freshwater shells (*Cyrena* and *Planorbis*). In a line almost parallel to Wady Igharghar Wady Mya descends from the plateau of Tademayt, and shows the importance of its ancient current by deep erosion of the Cretaceous rocks, in which a large number of left-hand tributaries have also left their mark. Away in the far east of the Libyan Desert Dr Zittel discovered stalactite caves in the limestone. The question arises, What has become of the abundant water-supply which filled the wadies and hollowed out the caves? Recent discoveries in the Algerian Sahara suggest that part of the water circulation has become subterranean. The streams from the Atlas which seem to be absorbed in the sands of the desert evidently find a series of underground reservoirs or basins capable of being tapped by artesian wells over very extensive areas. As Olympiodorus (quoted by Photius) mentions that the inhabitants of the Sahara used to make excavations from 100 to 120 feet deep, out of which jets of pure water rose in columns, it is clear that this state of matters is (historically) of ancient date. Since 1856 the French engineers have carried on a series of borings which have resulted in the fertilizing of extensive tracts; between 1856 and 1879 155 wells were bored in the province of Constantine alone. In Wady Rir', which runs for 80 miles towards the south-west of the Shott Melrir (comp. *infra*), the water-bearing stratum is among permeable sands, which are covered to a depth of 200 feet by impermeable marls, by which the water is kept under pressure. The wells, varying much in their discharge and "head," give a total of 3.5 cubic metres per second at an average temperature of 25° Fahr. A similar artesian zone exists between Negussa and Wargla. Connexions probably exist with subterranean water-supplies in the mountains to the north. That in some way the water in the artesian reservoirs is kept aerated is shown by the existence below ground of fishes, crabs, and freshwater molluscs, all of which were ejected by the well called Mezer in Wady Rir'. Hitherto those subterranean basins have been verified only in a comparatively limited area (the whole expanse of the Sahara being considered); but the same phenomena are probably repeated to some extent in other regions.⁴ The oases are of course proofs of the presence of a steady supply of underground moisture, for vegetation under the Saharan climate is exceptionally thirsty.

Everything considered, it may therefore be assumed that the desert formerly possessed a surface circulation of water capable of aiding in the processes of disintegration, removal, and deposition. Since the water disappeared other agencies have been at work. The surface of the rocks, heated by the sun and suddenly chilled by rapid radiation over night, gets fractured and crumbled; elsewhere the cliffs have been scored and the sand thus formed is at once turned by the wind into an active instrument of abrasion. In many places it has planed the flat rocks of the hammada as smooth as ice. Elsewhere it has scored the vertical faces of the cliffs with curious imitations of glacial striation, and helped to undercut the pillar- or table-like eminences which, under the name of *gurs* or "witnesses," are among the most familiar products of Saharan erosion. The softer quartz rocks of the Quaternary and Cretaceous

¹ This name, meaning the "depression," has long been in use, but appears to be a misnomer; the lowest point in Lenz's route, which, however, only crossed the east end of the Juf, was 400 feet above the sea.

series (and according to Zittel especially the Nubian sandstone) have been made to yield the sand which, drifted and sifted by the winds, has taken on the form of dunes. The slightest breeze is enough to make the surface "smoke" with dust; and at times the weird singing of the sands, waxing louder and louder, tells the scientific traveller that the motion is not confined to the superficial particles.¹ How important a part the winds may play in the redistribution of the lighter particles is probably shown by the clouds of red dust which were noticed by Edrisi as frequently obscuring the Atlantic sky between Cape Verd and the American coast, and which have recently been referred by Dr Gustav Hellemann to the African Sahara, whence Professor Tacchini also derives the similar clouds of dust observed in many parts of Italy (comp. Tehihatchef).

But even such a river-system as that supposed combined with all conceivable atmospheric agencies would only account for the minor phenomena of erosion. Dr Zittel in dealing with the Libyan Desert finds it necessary to assume violent freshwater floods proceeding from the south, though, as he confesses, this only shifts the difficulty a stage further back, as it involves an enormous change of climate. To render such a change of climate a probable hypothesis various recent speculations combine; and Dr Theobald Fischer and Dr Oscar Fraas agree in believing that the desiccation has markedly increased in historic times. Evidence derived from ancient monuments combined with the statements of Herodotus and Pliny are held to prove that the elephant, the rhinoceros, and the crocodile existed in North African regions where the environment is now utterly alien, and on the other hand that the camel is a late introduction. Humboldt sought to attribute the desiccation of the desert region of Asia and Africa to the effects of the north-east trade-wind; but Dr Lenz, who points out that in North Africa the wind seldom blows from the north-east but generally from the north or north-west² (the latter of course from the Atlantic, in the western parts, but farther east from the European regions of precipitation), argues that one of the principal causes has been the destruction of the forests on the highlands. The dry winds from the Sahara are known in Europe as the Scirocco and the Föhn or Fön.

Botanically the Sahara is the meeting-ground of representatives of the "Mediterranean" and the "Tropical" floras which have managed to accommodate themselves to the peculiar climatic conditions. The line of demarcation between the two floral areas, almost coinciding in the west with the Tropic of Cancer and in the east dipping south towards the meridian of Lake Tchad, assigns by far the greater portion of the area to "Mediterranean" influences.³ Uniformity, in spite of differences of altitude and soil, is a general characteristic of the vegetation, which outside of the oases consists mainly of plants with a tufty dry stiff habit of growth. The oases are the special home of the date-palm, of which there are about 4,000,000 in the Algerian oases alone. In company with this tree, without which life in the Sahara would be practically impossible, are grown apples, peaches, oranges, citrons, figs, grapes, pomegranates, &c. During the months from December to March wheat, barley, and other northern grain crops are successfully cultivated and in the hotter season rice, dukhin, durra, and other tropical products. Altogether the oasal flora has considerable variety; thirty-nine species are known from the Kufra group, forty-eight from the Aujila group.

Zoologically the Sahara is also a debatable territory, partly Mediterranean, partly Tropical. Apart from the domestic animals (camels, asses, &c.), and very noticeably a black breed of cattle in Adrar, the list of fifteen mammals comprises the jerboa, the fennec or fox, the jackal, the sand rat (*Psammomys obesus*), the hare, the wild ass, and three species of antelope. In Borku, Air, &c., baboons, hyenas, and mountain sheep are not uncommon. Without counting migratory visitants, about eighty species of birds have been registered—the ostrich, the *Certhilauda deserti* or desert-lark (which often surprises the traveller with its song), *Emberiza Saharæ*, three species of *Dromolea*, &c. Tortoises, lizards, chameleons, geckos, skinks, &c., of fifteen different species were collected by the single Rohlf's expedition of 1873-74; the serpents comprise the horned viper, *Psammophis sibilans*, *Colepeltis lacertina*, the python, and several other species. The edible frog also occurs. *Cyprinodon dispar*, a fish not unlike *Cyprinodon calaritanus*, is found in all the brackish waters of north Sahara and swarms in the lake of the Siwa oasis. The brine-shrimp has been described in the article FEZZAN.

The present population of the Sahara consists almost exclusively of Arabs, Berbers, and Negro tribes. The Berbers (Tuareg or Tuarik, &c.) occupy the west central region almost exclusively, appear sporadically in the western, and stretch northwards into Morocco and Algeria; the Negro tribes form a compact block in the east central region northwards and north-eastwards from Lake

Tchad; and the Arabs are in possession of all the rest of the country. Politically the Sahara belongs partly to Morocco (Tafilet, &c.), partly to Algeria and Tunis (and thus to France), and partly to the Turkish empire (Tripolis, Egypt, &c.). France especially has been steadily pushing south with the purpose of forming a junction ultimately with her colony on the Senegal. The spirit of independence among the Mohammedan populations has been crystallized and stimulated by the remarkable confraternity of Sidi Mohammed ben 'Ali es-Senusi, founded about 1837, and now possessing about 120 convents or zawiga (mostly in the Saharan region), with its headquarters at Jerabub.⁴ With this organization the French have already come into conflict in their southward progress. To establish their influence they propose the construction of a trans-Saharan railway and the opening up of the region to the south of Algeria and Tunis by the construction of an inland sea. According to M. Roudaire, the author and protagonist of this scheme, which is familiarly but deceptively styled the "flooding of the Sahara,"⁵ it is possible by proper engineering works to create an inland sea to the south of Algeria and Tunis with an average depth of 78 feet and an area of 8100 square miles, or about fourteen times the size of the Lake of Geneva. A Government commission decided that the excavation of the necessary canal would not be difficult, and that, in spite of silting-up processes, the work would at least last 1000 to 1500 years. M. de Lesseps, M. Roudaire's principal supporter, visited the district in 1883 and reported that the canal would cost five years' labour and 150,000,000 francs. The scheme, which has met with persistent hostility on the part of M. Cosson and others, is based on the following facts. The Gulf of Gabes is separated by a ridge 13 miles across and 150 feet high from Shott al-Fejej, a depression which extends south-west into the Shott Jerid, which in its turn is separated from the Shott Rharsa only by a still narrower ridge. Shott Rharsa is succeeded westwards by a series of smaller depressions and beyond them lies the Shott Melrir, whose north-west end is not far from the town of Biskra. What we know about such inland seas as the Caspian and the Aral seems to cast serious doubt on the probability of any increase of the rainfall in the Sahara by the formation of Roudaire's sea.

The commerce of the Sahara is not inconsiderable. Among the more important trade routes are—(1) from Morocco to Cairo by Insalah and Ghadames, which is followed by the pilgrims of Western Africa bound for Mecca; (2) from Kuka to Murzuk and Tripolis; (3) from the Sudan to Tripolis by Air and Ghat; (4) from Timbuktu to Insalah, Ghadames, and Tripolis; (5) from Timbuktu to Insalah and thence to Algeria and Tunis; (6) from Timbuktu to Morocco. The two great products are dates and salt. Full details of the date trade will be found in Fischer's *Die Dattelpalme*, 1881. The principal sources of salt are the rock-salt deposits of the Juf (especially Tandeni), the lakes of Kufra, and the rock-salt and brine of Kavar (Bilma).

Géol. de France*, 1881; Roudaire, *Rapport sur la dernière expéd. des Choits*, 1881 (and other reports by the same author); Tehihatchef, "The Deserts of Africa and Asia," in *British Association Reports* (Southampton, 1882); Derrécaigaix, "Explor. du Sahara: Les deux missions du Lieut.-Colonel Flatters," in *Bull. de la Soc. de Géogr.*, 1882; Lenz, *Timbuktu: Reise durch Marokko*, &c., 1884; and Reclus, *Nouv. Géographie Univ.*, xi., 1886, which contains an admirable résumé. (H. A. W.)

SAHARANPUR, or SEHARUNPOOR, a British district of India, in the Meerut division of the lieutenant-governorship of the North-Western Provinces. It lies between 29° 35' and 30° 21' N. lat., and between 77° 9' and 78° 15' E. long., and is bounded on the N. by the Siwalik Hills, separating it from the district of Dehra Dún, on the S. by the district of Muzaffarnagar, on the E. by the Ganges, and on the W. by the Jumna. Saharanpur forms the most northerly portion of the Doáb, or alluvial tableland, which stretches between the valleys of the Ganges and the Jumna. The Siwalik Hills rise precipitously on its northern frontier; at their base stretches a wild submontane tract, with much forest and jungle. Cultivation generally in this part is backward, the surface of the country being broken by wild and magnificent ravines. South of this tract, flanked on the east and west by broad alluvial plains, lies the Doáb, with fertile soil and good natural water-supply. This portion of the country is divided into parallel tracts

⁴ See list in Duveyrier's paper, *Bull. de la Soc. de Géogr.*, 1884.

⁵ In this connexion it is enough to mention Mr Mackenzie's scheme for flooding the Western Sahara; see *Flooding Sahara*, 1877, and Ravenstein, "The Western Sahara," in *Geog. Mag.*, 1876.

by numerous streams from the Siwálíks, while the Eastern Jumna and the Ganges Canals, which traverse the district from north to south and issue from its north-west and north-east corners, cover the district with a network of irrigation channels. The only large rivers are the Ganges, which enters Saháranpur 180 miles from its source, by a well-marked gorge formed in the rock at Hardwár; and the Jumna, which debouches into the plain about 123 miles from its source, at a place called Khára. The district has abundant means of communication: the Sind, Punjab, and Delhi Railway traverses it for a distance of 42 miles, with stations at Deoband, Saháranpur, and Sarsáwa; and it has numerous roads, both metalled and unmetalled. The climate of Saháranpur is that of the North-Western Provinces in general; at one season it is tropical, at another partially European. Its average annual rainfall is about 37 inches. Wild animals are plentiful, including the tiger, leopard, wild cat, lynx, hyæna, and wolf.

By the census of 1881 the population of Saháranpur numbered 979,544 (530,427 males and 449,117 females). By religion there were 653,272 Hindus, 317,535 Mohammedans, and 1793 Christians. Five towns had populations exceeding 10,000 each, namely, SAHÁRANPUR (*q.v.*), Hardwár Union (23,106), Deoband (22,116), Rurki (12,818), and Gangoh (12,089). Rurki (Roorkee) is a town of considerable importance, situated in 29° 52' 25" N. lat. and 77° 55' 40" E. long. It is the headquarters of the Ganges Canal workshops and iron-foundry, with the Thomason Civil Engineering College, for the instruction of natives and others in practical engineering; it contains also an excellent meteorological observatory. Hardwár municipality, which lies 39 miles north-east of Saháranpur town, on the right bank of the Ganges, is the most frequented of all Hindu places of pilgrimage, and is largely used for the bathing festivals. Every twelfth year, when Jupiter is in Aquarius, a great fair or *kumbh-mela* is held, which attracts an immense number of people; as many as 3,000,000 attended in 1882.

Of a total area of 2221 square miles 1256 are cultivated and 931 are cultivable waste. Cereals form the principal products. The chief spring crops are wheat, barley, pulses, and oil-seeds, and the staples of the rain crops are rice, joar, bajra, and vegetables; the cultivation of cotton and indigo is also carried on, the latter in much greater quantities since the introduction of canal irrigation has rendered its out-turn less precarious than formerly. The commercial importance of the district depends mostly on its raw materials. It manufactures broad-cloth, jewellery, and sweetmeats; among the articles produced at the Rurki workshops are steam-engines, pumps, printing presses, lathes, and mathematical instruments. The gross revenue of Saháranpur in 1883-84 amounted to £172,960, of which the land-tax contributed £118,067.

During the later years of the Mogul empire Saháranpur was the scene of much strife and suffering on account of the perpetual raids of the Sikhs, but in 1785 the district under Ghulam Kádir enjoyed comparative tranquillity. On his death the country fell into the hands of the Mahrattas, but it was for a time occupied by the adventurer George Thomas, until his death in 1802. It was afterwards overrun by Sikhs and Mahrattas, remaining practically in the hands of the former until their defeat at Charaon, November 1804, when it passed under British rule. Several disturbances subsequently took place among the native chiefs; but from 1824 to 1857 nothing occurred to disturb the peace of the district. The mutiny in this part was soon quelled.

SAHÁRANPUR, principal town and administrative headquarters of the above district, is situated in 29° 58' 15" N. lat. and 77° 35' 15" E. long., on a small stream (the Damaula Nadi) in an open level country. Its height above the sea is over 900 feet. The town possesses a fine botanic garden, where early experiments were made in tea and cinchona culture. Amongst its buildings are an old Rohilla fort, used as a court-house, and a handsome Mohammedan mosque. A considerable trade is carried on in grain, sugar, molasses, and country cloth. The population in 1881 was 59,194 (31,506 males and 27,688 females).

SAIDA. See SIDON.

SAIGA. See ANTELOPE, vol. ii. p. 102.

SAIGON, the capital of French Cochín China, occupies an area of 1000 acres, on the right bank of the Saigon river or Don-nai (one of the streams that inosculate with the deltaic branches of the Me-kong), about 60 miles from

the China Sea. In 1884 it was connected by rail with Mytho, 37 miles south-west on one of the branches of the Me-kong, with which it had obtained direct water-communication in 1877 by the opening of the Canal de Cho-gon.

The present city has been practically created since 1861, and its fine streets, boulevards, squares, and public buildings make it one of the most attractive towns in the East, as it was well planned and the plan not unworthily carried out. The town possesses a governor's palace or citadel (cost 12,000,000

FIG. 1.—Map of Saigon District.

francs) with a grand façade, a cathedral (1877; cost 2,500,000 francs), a palace of justice (1882), a chamber of commerce, a large military hospital, municipal gardens, and botanical gardens with collections of wild, beasts. Among the educational institutions are the Collège Chasseloup-Laubat and the Collège d'Adran, the latter in memory of Bishop Piqueaux de Behaigne, whose tomb is in the vicinity of the town. There is a large arsenal with upwards of 100 European employes and a special establishment for the artillery with machine-shops and foundries. A floating-dock was constructed in 1868; a much larger one (cost 3,400,000 francs) sank in 1880-82 at its first trial and became a wreck. The population of Saigon in 1881 was 13,348. The Europeans, exclusive of the troops, numbered only 965 (913 French). The Chinese element was the strongest, and next came the Anamite. The municipality consists of fifteen members, of whom four are Anamites, the rest, including the mayor, being French. As a commercial centre Saigon is one of the principal towns in the colony, but most of the trade is really done at Cholon, 4 miles off on the Arroyo Chinois and Rach-lo-gom, but connected with Saigon by a steam tramway. Though it has its own local government and officials, Cholon is practically part of the capital. Chinese emigrants from Bien-hoa were its founders in 1778, and the Chinese still form half of its population and almost monopolize its trade. In 1881 it had 39,925 inhabitants (83 Europeans). Wide streets have been opened up through its original complexity of lanes and substantial quays constructed for miles along the Arroyo. A fine granite-paved market stands in the heart of the town. Rice is the great staple of the Saigon-Cholon trade, finding purchasers mainly at Hong-Kong, Java, and the Philippines. Other articles are black pepper, gamboge, and cocoa-nut oil. In 1883 8,648,243 piculs of rice, worth more than

FIG. 2.

£2,000,000, were exported. In 1884, leaving out the Messageries Maritimes, 503 vessels (568,077 tons), of which 239 (253,871 tons) were British, cleared from Saigon. Fig. 2 shows the relative positions of Saigon and Singapore.

Saigon was the native capital of Lower Cochín China and the residence of the governor of the southern provinces. In 1836 it was fortified for the emperor Gia Long by Colonel Ollivier. The French under Admiral Rigault de Genouilly captured it in 1859 and it was part of the territory ceded in 1862. The importance of the old town may be judged by the vast mounds of brick and stone which still crowd the ancient necropolis on one of the two roads between Saigon and Cholon.

SAIL, SAILCLOTH, SAILMAKING. A sail is a sheet of canvas (or other material of the requisite flexibility and strength) by the action of the wind on which, when spread out or extended, a vessel is moved through the water. Sails are supported and extended by means of masts, yards, gaffs, booms, bowsprit—all technically termed “spars”—and stays or slanting ropes. In the first experiments for impelling vessels by sails the least complicated form, that of a single square sail erected on a single mast, was no doubt adopted. To the quadrangular the triangular sail would soon be added; and single sails of both these forms are known to have been used at very early periods. Subsequently the trapeziform and trapezoidal sails also came into use. As vessels increased in size, thereby requiring a greater surface of canvas to impel them, it became necessary to use not only more sails but also an increased number of masts; and the number and disposition of the several kinds of sails could be almost indefinitely varied according to the ideas of navigators, the services required of the vessels, the places in which they were employed, and the size of the crews. Thus a great variety of rig naturally arose. Leaving out of account the many nondescript styles adopted in the case of boats and small craft, all modern vessels may, for general purposes, be considered as belonging to one or other of the following categories—cutter, schooner, three-masted schooner, brigantine, brig, barquette, barque, or full square-rigged ship; but the cardinal distinction is that by which they are classified as *square-rigged* or *fore-and-aft-rigged* (compare SEAMANSHIP and SHIP). These expressions can be easily explained by reference to any three-masted ship. The mast nearest the bow or head is known as the fore-mast, the next abaft or nearest the middle of the ship as the main-mast, and the third or that nearest the stern as the mizzen-mast. Each mast consists of several sections, that attached to the hull being called the lower or standing-mast, the next above that the top-mast, the next the top-gallant-mast, above which may rise a pole or royal-mast. On each of these masts, and at right angles with it, is a yard denominated “square,” which is hung (slung) by the middle and balanced. These yards are named according to their situation, those placed on the fore and main standing-masts being called respectively the fore and main lower-yards, that on the mizzen the cross-jack-yard; the yards on the top-masts are called the top-sail-yards, those on the top-gallant-masts the top-gallant-yards, and those on the royal-masts the royal-yards. To each of these yards a sail is *bent* or attached, taking its name from the yard; thus the principal sail upon the fore-lower-yard is called the fore-course or fore-sail; the next above, upon the fore-top-sail-yard, is the fore-top-sail; above which, upon the fore-top-gallant-yard, is the fore-top-gallant-sail; and above all, upon the fore-royal-yard, is the fore-royal. In like manner on the main-mast we have the main-course or main-sail, main-top-sail, main-top-gallant-sail, and the main-royal. Similar appellations are given to those on the mizzen-mast; in large merchant-ships, by means of a sky-sail-pole, a sail termed “sky-scraper” is sometimes set above the royals, but not so frequently as formerly. Such square sails can be placed at right angles to the direction of the keel of the ship, a position given to them when going before the wind; the same sails can also, by means of braces, be placed obliquely to the keel with a side wind, commonly termed by seamen “on a wind” or “by the wind.” In addition to these there are sails between the masts, set either on gaffs (unbalanced) or on stays, also others beyond the extremities of the ship, extended principally by means of the bowsprit, which, in addition to supporting the fore-mast by a stay, also supports the jib and flying-jib-booms for extending the sails still farther

forwards; the means for extending the after-sail are the driver or spanker-boom and the gaff. Sails extended or set on gaffs and on stays are called “fore-and-aft,” and are generally or approximately in a vertical plane passing through the keel; but a certain degree of obliquity can be given them by easing off the sheet or aft lower corner of the sail. A ship fitted as above described would be termed “square-rigged,” the square sails predominating both in importance and in number. A square-rigged line-of-battle ship would be supplied with the following descriptions of sails¹ :—

<i>Square.</i>	<i>Fore-and-Aft.</i>
Fore-course or fore-sail.	Flying-jib.
„ top-sail.	Jib.
„ top-gallant-sail.	Second jib.
„ royal.	Fore-gaff-sail.
Main-course or main-sail.	„ try-sail (storm-sail).
„ top-sail.	Main-gaff-sail.
„ top-gallant-sail.	„ try-sail (storm-sail).
„ royal.	Mizzen-try-sail (storm-sail).
Mizzen-top-sail.	Spanker.
„ top-gallant-sail.	Stay-sail-fore (storm-sail).
„ royal.	„ „ top.
Studding-sail-fore.	
„ „ top.	
„ „ top-gallant.	
„ sail-main-top-gallant.	

In the fore-and-aft-rig the principal sails are of course fore-and-aft; a cutter (vessel with one mast) when fully equipped carries the following :—

<i>Fore-and-Aft.</i>	<i>Square.</i>
Jib-top-sail.	Square-sail (set flying).
Jib.	
Fore-sail.	
Boom-main-sail.	
Gaff-top-sail.	

The several sides of a sail have separate names applied to them, the upper part or side being known as the “head,” the lower part as the “foot”; the sides in general are called “leeches,” but the weather or side edge where the wind enters the sail, of any but a square-sail, is called the “luff,” and the other edge the “after-leech.” The two top corners are “earings,” but the top corner of a jib, &c. (triangular, one corner only), is the “head”; the two bottom corners are in general “clews”; and the weather clew of a fore-and-aft-sail or of a course while set is the “tack.”

The relative importance of particular sails in the working of a ship varies according to conditions of weather, and is a matter for the judgment of the officer in command. The following table, however, shows approximately what sails are commonly set “by the wind,” presuming that the effect on the ship in relation to her stability is safe :—

Winds as commonly distinguished.	Sails commonly set “by the wind.”
Light airs	Courses, top-sails, top-gallant-sails, royals, spanker, jib, flying-jib, and all light sails.
Light winds	
Light breezes ...	
Moderate breezes	
Fresh breezes ...	Royals and flying-jib taken in, in a sea way, to two reefs in the top-sails.
Strong breezes ...	Single-reefed top-sails, and top-gallant-sails, in much sea, two reefs in the top-sails to taking in top-gallant-sails.
Moderate gales ...	Double-reefed top-sails to treble-reefed top-sails, reefed spanker, and jib.
Fresh gales	Close-reefed top-sails, reefed courses, to taking in spanker, jib, fore and mizzen top-sail.
Strong gales	Reefed courses, close-reefed main-top-sail, fore-stay-sail, mizzen-try-sail, to taking in the main-sail.
Heavy gales	Close-reefed main-top-sail, storm stay-sails, to storm stay-sails or close-reefed main-top-sail only.
Storms.	

¹ Some ships (merchant-liners) have two jibs, inner and outer, and

To the casual observer sails when spread and in use appear merely as so many large pieces of cloth; but some of them are of very considerable size: it is not at all unusual in full square-rigged ships for a main-course or main-sail to contain 1000 yards of canvas (24 inches wide), and a main-top-sail nearly as much,—the single suit for such a vessel comprising upwards of 10,000 yards. Courses and top-sails are made reducible; in the British navy they are reduced by means of reefs (two in courses, four in top-sails), each fitted with spilling, slab, and reef lines and becket, and toggles on the yard (reef-points throughout being now obsolete). In the merchant service double top-sails—upper and lower—are much in use on account of handiness in reducing sail; there is also “patent reefing gear,” such as Cunningham’s, which allows reefing to be done as much as possible from deck. The dimensions of masts and yards, quantity of canvas or area of sail, centre of gravity of each sail (from which the moment of sail is obtained and compared with the moment of stability), centre of effort of the sails, and other important calculations necessary in relation to the body of the vessel are made by constructors and naval architects.

Sailcloth is obtainable from any description of fibrous material capable of being woven into cloth, having sufficient compactness and closeness of texture, and possessing the requisite strength for sustaining the heavy pressure which sails often have to bear in severe weather. Several descriptions of fibre might be enumerated which would to a certain extent serve for sailcloth but for the absence of quality of endurance or resistance; hemp has been and is now occasionally used, as also a mixture of cotton and linen yarn, or cotton only,—especially in America; but in the United Kingdom *FLAX* (*q.v.*) is the usual staple material, since, when well manufactured, it possesses the qualities of flexibility and lightness, and, what is still more important, the element of strength in a very large degree.

The following points may be regarded as of primary importance for securing sailcloth or canvas of a superior quality and durability. Whatever flax is used, it is absolutely necessary that the “warp” and “weft” of the canvas be spun wholly from the “longs,” be free from blacks and any mixture of short flax, well dressed or heckled, and that the yarn be well and evenly spun and properly twisted. Both warp and weft yarn should be twice boiled with the best American pot and pearl ashes, and carefully and thoroughly washed and cleansed. No acid chloride of lime or other preparation of chlorine, nor any deleterious substance, should be used in any stage of the process, otherwise the integrity of the fibre will most probably be interfered with; the only advantage got is that the cloth looks much whiter, which for yachts and pleasure-boats is perhaps desirable, but for naval and mercantile uses is not at all necessary. The yarns are first boiled a sufficient length of time in a solution of the best American potash, in fixed proportions of ashes, green yarn, and water, then mill-washed (beating process), and subsequently carefully washed in a considerable stream of clear running water, and wrung. They are again boiled for a sufficient length of time in a solution of American pearl ashes, in due proportions of ashes, green yarn, and water, then carefully rinsed, or washed in a clear stream of water, carefully dried, and frequently shaken in the course of drying, so that the fibres of the flax may be equally stretched. These repeated boilings, &c., have the effect of cleansing, bleaching, softening, and removing all vegetable impurities which may be hanging about; no starch, tallow, paste, or weaver’s dressing of any description should be used, otherwise the fabric will tend to mildew if allowed to remain damp for any time. Sailcloth is made in bolts, mostly 24 inches wide, but also 18 inches wide, and for yachting purposes frequently still less wide, upon the ground that the narrower the cloth the flatter and better will the sail stand to its work. It is generally made of eight different qualities in respect of thickness, numbered 1 to 8 accordingly; the heavier numbers—Nos. 1, 2, and 3—are used for storm and other sails that have to do heavy work, the remaining numbers for the lighter descriptions of sail. The weight of each bolt of canvas 24 inches wide, from Nos. 1 to 6 inclusive for 39 yards in length and

for Nos. 7 and 8 for 40 yards in length, is about as follows, viz., No. 1, 46 lb; No. 2, 43; No. 3, 40; No. 4, 36; No. 5, 33; No. 6, 30; No. 7, 27; No. 8, 25 lb. The weight of each bolt of narrower canvas is in proportion. The warp (or lengthwise) should consist of the following proportions of clean unstarched yarn, viz. :—

No.	not less than 26 lb.	score reed.	double threads.
1	24	16½	660
2	22	16½	660
3	21	17	680
4	19	17	680
5	18	17	680
6	15	20	800
7	14	20	800

As a rule about 40 yards in length may be considered as the average content of each bolt. Particular attention should be paid to the weaving, that the texture be struck sufficiently close, and the selvages be evenly and well manufactured; what is termed a slack selvage (that is, one selvage longer than the other) is not only awkward for the sailmaker but unsatisfactory both in wear and appearance, the slack side showing itself puckered. Sailcloth made upon these conditions is very likely to be a good article; tests, however, can be applied, generally to strips 1 inch wide from Nos. 1 to 6 inclusive, and 1½ inch wide from Nos. 7 and 8. Weft and warp (24 inches in length) in each case are placed in a small testing machine, which has a dial plate with a spring underneath; vices are attached to grip the strips, one vice to the spring, the other in connexion with a long screw with a handle; by turning this handle the vices are drawn asunder until the strip breaks, and the hands on the dial-plate indicate the strain in pounds. The following is a fair test of strength for the various numbers of good sailcloth :—

No.	Weft.	Warp.	No.	Weft.	Warp.
1	480 lb.	840 lb.	5	370 lb.	280 lb.
2	460	820	6	350	250
3	440	800	7	330	330
4	400	280	8	330	310

It is not at all unusual, however, to find some sailcloth stand a strain considerably in excess of this. Freedom from blacks, twist and spun of the yarn, stiffening, calendering, &c., can be discovered by observation and a magnifying glass, excessive dressing by a little tincture of iodine.

Sailmaking is a very old branch of industry in connexion with the navy and commerce, and it still continues to be important notwithstanding the enormous extent to which steam is now employed in navigation.

The operations of the sailmaker may be stated as follows. The dimensions of mast and yards and sail plan being supplied, the master sailmaker is enabled to determine the dimensions of each sail—after due allowance for stretching—in terms of cloths and depth in yards—if a square sail, the number of cloths in the head, number in the foot, and the depth in yards; if a fore-and-aft sail (triangular), the number of cloths in the foot, and the depth in yards of the luff or stay and of leech or after-leech; if a fore-and-aft sail (trapezium form), the number of cloths in the head, number in foot, and the depth of mast or luff and of after-leech. These particulars obtained, there is got out what is technically termed a “casting,” which simply means the shape, length, &c., of each individual cloth in the sail. These figures are given to the cutter, who proceeds to cut out the sail cloth by cloth in consecutive order, numbering them 1, 2, 3, 4, &c.; the series of cloths thus cut out are handed over to the workman, who joins them together by carefully made double flat seams, sewn with twine specially prepared for the purpose, with about 120 stitches in a yard. In the heavy sails the seam is about an inch and a half in width and in the British navy stuck or stitched in the middle of the seam to give additional strength; the seams in the lighter sails are about an inch wide. The whole of the cloths are then brought together, and spread out, and the tabling (or hemming, so to speak) is turned in and finished off with about 72 stitches to a yard. Strengthening pieces or “linings” are affixed where considered necessary, in courses and top-sails such pieces as reef-bands, middle-bands, foot-bands, leech-linings, bunt-line cloths; in top-sails (only) a top-lining or brim; in other and lighter sails such pieces as mast-lining clew and head, tack, and corner pieces; holes, such as head, reef, stay (luff), mast, cringle, bunt-line, &c., are also made where required, a grommet of line of suitable size being worked in them to prevent their being cut through. The next thing to be done is to secure the edges of the sail,—an important operation, as much depends upon this whether the sail will stand well and do its work efficiently. Bolt-rope, a comparatively soft laid rope made from the finer hemp yarn (Italian) is used for this purpose; in the British navy it ranges from 1 inch (increasing in size by quarter inches) up to 8 inches inclusive, the size selected for each part of a sail being determined by the amount of strain it will have to bear; it is then neatly sewn on with roping twine specially prepared, the needle and twine passing between and clear of every two strands of the rope in roping. Where slack sail has to be taken in, it is the practice to leave it to the judgment of the sail-

their top-sails also in two parts, upper and lower or cap-top-sails, an arrangement which makes it easier to reduce or shorten sail; they also have a mizzen course (cross-jack), and carry several light stay-sails so as to catch every breath of wind.

maker; but where possible it is better to set up the rope by means of a tackle to a strain approximate to what it will have to bear when in use, and whilst on the stretch mark it off in yards, as also the edge of the sail in yards, so that by bringing the marks together in roping the sail will stand flat. In the British navy the largest size of rope sewn on to a sail is 6 inches; sizes above this are used for foot and clew ropes of top-sails and courses, being first wormed, parcelled (that is, wound round with strips of worn canvas), tarred, and served over with spun yarn; the foot of the sail is then secured to it by being marled in. Where two sizes of bolt-rope used in roping a sail have to be connected, it is effected by a tapered splice. Cringles (similar to the handle of a maund) formed by a strand of bolt-rope, mostly having a galvanized iron thimble in them as a protection, are then stuck where necessary, as at the corners, sides or leeches, mast or luff; they are required either for making stationary or hauling "taut" by tackle or otherwise certain parts of the sail when in use. Fore-and-aft sails, such as spankers, gaff-sails, and storm try-sails, are reduced in size by reef-points made of stout line (4 to 20 lb), crow-footed in the middle, a hole being pierced through every seam; one-half of the point is passed through and the crowfoot sewn firmly to the sail; the number of reefs depends upon the size of the sail, and the reefs are placed parallel to the foot. The sails—now finished in respect of making—have to be fitted, that is, such ropes have to be attached to each of them as are necessary for proper use; such ropes may be summarily stated as follows:—head-earings, robands, reef-earings, reef-lines, spilling and slab lines, reef-tackle pendant, reef-points, bow-line bridles, bunt-line toggles, bunt-becket, leech-line strops and toggles, toggles in clews, sheet ropes, down-haul, lacings, head and stay, tack-rope (gaff top-sail), tack lashing, bending strops, matting, and gaskets.

The tools and appliances of a sailmaker are not very numerous:—a bench about 7 feet long and 15 inches high, upon which he sits to perform the greater part of his work; palms for seaming and roping to fit the hand, made of hide lined with leather, a plate properly tempered being fixed in it having chambers to catch the head of the needle, thus acting as a thimble in forcing it through the several parts of canvas in seaming, and between the strands and through the canvas in roping; needles of various sizes, that for seaming being the smallest; and fids, splicing, serving, and stretching knife, rubber, sail-hook, bobbin for twine, and sundry small articles. (E. J.E.)

SAINFOIN (*Onobrychis sativa*) is a low-growing perennial plant with a woody root-stock, whence proceed the stems, which are covered with fine hairs and bear numerous long pinnate leaves, the segments of which are elliptic. The flowers are borne in close pyramidal or cylindrical clusters on the end of long stalks. Each flower is about half an inch in length with lanceolate calyx-teeth shorter than the corolla, which latter is papilionaceous, pink, with darker stripes of the same colour. The indehiscent pods or legumes are flattened from side to side, wrinkled, somewhat sickle-shaped and crested, and contain only a single seed. In Great Britain the plant is a native of the calcareous districts of the southern counties, but elsewhere it is considered as an escape from cultivation. It is native throughout the whole of central Europe and Siberia; but it does not seem to have been cultivated in Great Britain till 1651, when it was introduced from France or French Flanders, its French name being retained. It is grown as a forage plant, being especially well adapted for dry limestone soils. It has about the same nutritive value as lucerne, and is esteemed for milch cattle and for sheep in winter. Sinclair speaks in high terms of its value for this latter purpose.

SAINT. The New Testament writers have much to say about the relations of the "saints" (as members of the various churches are usually called) with their living contemporaries, but are comparatively reticent on their duties and privileges with regard to their departed brethren. Long before the close of the 4th century, however, certain very definite practices in the way of commemoration and invocation had sprung up, which ultimately found doctrinal expression in the authoritative documents alike of the Eastern and of the Western Church. (1) *Commemoration*.—Under **FUNERAL RITES**, **MANES**, &c., allusion has already been made to the ancient custom of visiting the tombs of deceased relatives at certain periods and there

offering various gifts. With certain modifications, this practice was retained by the early Christians; they celebrated the Eucharist at or near the grave, laid oblations on the altar in the name of the departed, and in the pre-communion prayer made supplication for the peace of their souls. Thus among the usages "originated by tradition, strengthened by custom, observed by faith," Tertullian (*De Cor. Mil.*, 3; comp. *De Exh. Cast.*, 11) mentions "the offerings we make for the dead as often as the anniversary comes round" (comp. **SACRIFICE**, p. 139). If such commemoration was usual in domestic circles, it was little likely to be omitted by Christian congregations in the case of those who had "spoken to them the word of God," least of all when the bishop had also been, as was so often the case, a martyr. In the very instructive document of the 2d century, preserved by Eusebius (*H. E.*, iv. 15), in which the martyrdom of **POLYCARP** (*q.v.*) is described, we are told that the followers of the martyr, having taken up the bones, deposited them "where it was proper that they should be." "There also, as far as we can, the Lord will grant us to assemble and celebrate the natal day of his martyrdom in joy and gladness." Cyprian (*Ep.*, 36) exhorts that the days of death of those who have died in prison should be carefully noted for the purpose of celebrating their memory annually; and all the earliest extant liturgies contain commemorations of the departed. The names to be commemorated were written on the diptychs (see **DIPTYCH**). (2) *Invocation*.—It is not difficult to understand how a belief in the efficacy of the prayers of departed saints—especially of martyrs—should at an early date have taken a practical form. Martyrs were believed to pass into the immediate presence of God, and the supposed nature of their claims there is not dimly indicated in the document already referred to, which once and again speaks of Polycarp as "a noble victim selected from the flock," "a rich and acceptable sacrifice to God." The readers of Cyprian are familiar with the use made of the intercession of living "martyrs" by the lapsed to secure their reconciliation with the church; but positive evidence of the intercession of the dead being invoked for obtaining favour with God is not forthcoming so soon. Perhaps, indeed, Cyril of Jerusalem (*c.* 350) is the earliest author to make express allusion to the practice (*Cat. Myst.*, v. 9): "we commemorate . . . patriarchs, prophets, apostles, martyrs, . . . that God at their prayers and intercessions (*προσεβεταις*) would receive our supplications." In the liturgies, however, the oblation still continued to be offered "for all martyrs and confessors" as well as for others, and Augustine was the first to declare (*In Joann.*, Tract. 84) that "at the table of the Lord we do not commemorate martyrs in the same way that we do others who rest in peace so as to pray for them, but rather that they may pray for us that we may follow in their footsteps."

For the subsequent development of Catholic practice see the various church histories; compare also **CANONIZATION**, **LITANY**, **RELICS**, **IMAGE WORSHIP**, &c. Previous to the Reformation ecclesiastical legislation mainly sought to check the popular tendency towards something like polytheism. The Tridentine doctrine is "that the saints who reign along with Christ are to be honoured and invoked, that they offer prayers for us, and that their relics are to be venerated." All the churches of the Reformation, on the other hand, while in one form or another commemorating "all thy servants departed this life in thy faith and fear," practically concur in the teaching of the Church of England (*Art. xxii.*), that "the Romish doctrine concerning . . . invocation of saints" is "a fond thing, vainly invented, and grounded upon no warranty of Scripture, but rather repugnant to the word of God."

ST ALBANS, a city, municipal borough, and market town of Hertfordshire, England, is finely situated on an eminence above the river Ver, on the main line of the Midland Railway and on branches of the London and North-Western and the Great Northern lines, about 24 miles

north-west of London and 5 miles west from Hatfield. The abbey or cathedral church, in some respects one of the most remarkable ecclesiastical buildings in England, is described below. St Michael's church to the west of the town, within the site of the ancient Verulamium, was originally constructed in the 10th century partly out of the ruins of the town. Considerable portions of the Norman building remain; the church contains the tomb of Lord Chancellor Bacon. St Stephen's church, dating from the same period, contains some good examples of Norman architecture. St Peter's church has been in great part rebuilt, but the nave of Early Perpendicular remains. The (restored) clock-house in the market-place was built by one of the abbots in the reign of Henry VIII. There is an Edward VI. grammar-school. The principal modern buildings are the corn exchange, the court-house, the prison, the public baths, and the public library. There are a number of charities and benevolent institutions, including the hospital and dispensary, and the almshouses founded in 1734 by Sarah duchess of Marlborough. The principal industries are the manufacture of silk and straw-plaiting. There are also breweries and ironfoundries. The population of the municipal borough (area, 997 acres, extended in 1879) in 1881 was 10,931; the population of the same area in 1871 was estimated at 8239.

Not only is the cathedral "a text-book of mediæval architecture from its beginning to its ending," but it "is still in style, material, and feeling that one among our great churches which most thoroughly carries us back to Old English and even to earlier days" (Freeman). Shortly after the execution of Britain's proto-martyr, St Alban, probably in 303, a church was built on the spot. In 793 Offa of Mercia, who professed to have discovered the relics of the martyr, founded in his honour a monastery for Benedictines, which became one of the richest and most important houses of that order in the kingdom. The abbots Ealdred and Ealmer at the close of the 10th century began to break up the ruins of the old Roman city of Verulamium for materials to construct a new abbey church; but on account of the unsettled character of the times its erection was delayed till the time of William the Conqueror, when Paul of Caen, a relative of Archbishop Lanfranc, was in 1077 appointed abbot. Canterbury as built by Lanfranc was almost a reproduction of St Stephen's, Caen; but Paul, while adopting the same model for St Albans, built it on an immensely larger scale. The church was consecrated in 1115, but had been finished some years before. Of the original Norman church the principal portions now remaining are the eastern bays of the nave, the tower, and the transepts, but the main outlines of the building are still those planned by Paul. It is thus one of the most important specimens of Norman architecture in England, with the special characteristic that, owing to the use of the flat broad Roman tile, the Norman portions are peculiarly bare and stern. The western towers were pulled down in the 13th century. About 1155 Robert de Gorham repaired and beautified the early shrine and rebuilt the chapter-house and part of the cloister; but nothing of his work now remains except part of a very beautiful doorway lately discovered. Abbot John de Cella (1195-1214) pulled down the west front and portions of the north and south aisles. He began the erection of the west front in a new and enriched form, and his work was continued by his successor William de Trumpington (1214-35) in a plainer manner. In 1257 the eastern portion was pulled down, and between the middle of the 13th and the beginning of the 14th century a sanctuary, ante-chapel, and lady chapel were added, all remarkably fine specimens of the architecture of the period. In 1323 two great columns on the south side suddenly fell, which necessitated the rebuilding of five bays of the south aisle and the Norman cloisters. Various incongruous additions were made during the Perpendicular period, and much damage was also done during the dissolution of the abbey to the finer work in the interior. The building within recent years has undergone extensive renovation, first under the direction of Sir Gilbert Scott, and latterly to a much greater extent under Sir Edmund Beckett. Its extreme length outside is 550 feet, which is exceeded by Winchester by 6 feet. The nave (284 feet) is the longest Gothic nave in the world and exceeds that of Winchester by about 20 feet. The length of the transepts is 175 feet inside. The monastic buildings have all disappeared with the exception of the great gateway.

To the south-west of the present city of St Albans stood the ancient *Verulamium*, one of the oldest towns in Britain, on Watling Street. It was the chief station of Cassivellaunus at the time of Caesar's invasion, and under the Romans became a *municipium*. The ancient town which grew up around St Albans church was

completely destroyed by the Saxons between 500 and 560. During Wat Tyler's insurrection the monastery was besieged by the townspeople, many of whom were executed in consequence. At St Albans the Lancastrians were defeated on 21st May 1455, their leader, the duke of Somerset, being killed, and Henry VI. taken prisoner; there too Queen Margaret defeated the earl of Warwick on 17th February 1461. During the civil wars the town was garrisoned for the Parliament. On a printing press, one of the earliest in the kingdom, set up in the abbey the first English translation of the Bible was printed. A charter of incorporation was granted to the town by Edward VI. It returned two members to parliament until 1852, when it was disfranchised. It became a bishop's see in 1877. Nicholas Breakspear, the only English pope (Adrian IV.), was born near St Albans.

See Matthew Paris, *Historia Major*; H. T. Riley, *Chronicle of the Monastery of St Albans*, 11 vols., 1868-73; Nicholson, *History of St Albans*; Buckler, *Norman Church of St Albans*; Neale, *Abbey Church of St Albans*, 1879; Sir E. Beckett, *St Albans Cathedral and its Restoration*, 1885.

ST ALBANS, a township and village of the United States, the capital of Franklin county, Vermont, at the junction of several divisions of the Central Vermont Railroad. The village lies on an elevated plain about 3 miles east of Lake Champlain, and has its principal buildings arranged round a public park. Besides being the seat of the extensive workshops of the railroad company, St Albans is the great cheese and butter market of the eastern States. In the neighbourhood, which is celebrated for the beauty of its scenery, are quarries of calico stone and variegated marble. The population of the township was 1814 in 1850, 3637 in 1860, 7014 in 1870, and 7193 in 1880. Being only 14 miles distant from the Canadian frontier, the village has more than once been the scene of political disturbances. In 1866 a band of 1200 Fenians, on their return from a fruitless invasion of Canada, were disarmed there by the United States troops.

ST AMAND-LES-EAUX, a town of France, in the department of Nord, at the junction of the Elnon with the Scarpe (a left-hand tributary of the Scheldt), $7\frac{1}{2}$ miles by rail north-west of Valenciennes and 22 south-east of Lille. It has numerous industrial establishments, but is better known from the mineral waters in the vicinity. Though from Roman coins found in the mud it is evident that these must have been frequented during the Roman period, it is only two centuries since they began to be again turned to account. There are four distinct springs; the water (75° Fahr.) contains sulphates of lime and sulphur, and deposits white gelatinous threads without smell or taste. The black mud, which constantly gives out sulphuretted hydrogen, is composed of three strata—(1) a clayey peat, (2) clay, and (3) a composition of silica, carbonate of lime, oxide of iron, and aluminium. Numerous small sulphurous springs ooze through the lowest stratum and, soaking those above, form a slough in which patients suffering from rheumatism, gout, and certain affections of liver and skin remain for hours at a time. The population in 1881 was 7881 (commune, 11,184).

St Amand owes its name to St Amand, bishop of Tongres, who founded a monastery here in the reign of Dagobert. The abbey was laid waste by the Normans in 882 and by the count of Hainault in 1340. The town was captured by Mary of Burgundy in 1447, by the count of Ligne, Charles V.'s lieutenant, in 1521, and finally in 1667 by the French. The abbey has been destroyed, with the exception of the gateway flanked by two octagonal pavilions, now occupied by municipal offices; and of the abbey church there remains only the 17th-century façade.

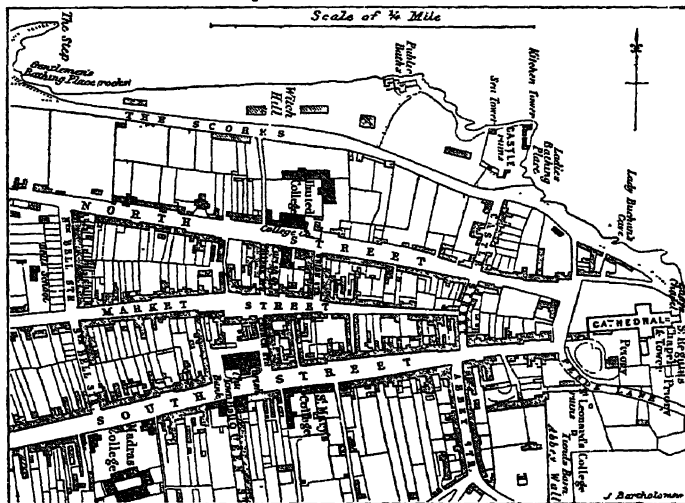

SAINT-AMANT, MARC ANTOINE GERARD, SIEUR DE (1594-1661), the most eminent of a curious bacchanalian school of poets in France during the 17th century, was born at Rouen in the year 1594. Very little is known of his family except that it was of some position at Rouen, and the mysterious description which all his French biographers give of his father—that he was a sailor "qui commanda pendant 22 ans un escadre de la reine Élisabeth"—does not greatly assist an English imagination. It appears that Saint-Amant himself haunted taverns and

other resorts of gay society a good deal during his youth and manhood, that he attached himself at different times to different great noblemen—Retz (the duke, not the cardinal), Créquy, Harcourt, &c.—that he saw some military service, and sojourned at different times in Italy, in England (a sojourn which provoked from him a violent poetical attack on the country, only printed within the last thirty years), in Poland (where he held a court appointment for two years), and elsewhere. But details on all these points are both few and vague. Saint-Amant's later years were spent in France; and he died at Paris in 1661.

Saint-Amant has left a not inconsiderable body of poetry as various in style as Herrick's, and exhibiting a decided poetical faculty, hardly at all assisted by education. Of one class of his poetry the chief monument is the *Moïse Sauvé*, published in 1653. The author calls this by the odd title of "idylle héroïque"; but it is to all intents and purposes an epic of the school of Tasso. It is not by any means without merit, and the alexandrine couplet is managed in it with much vigour and ease. The second and larger part of Saint-Amant's works consists of short miscellaneous poems on a great variety of subjects. The best of these are Bacchanalian, the oft-quoted *La Débauche* being one of the most remarkable convivial poems of its kind. All through his work flashes of strength and true poetical imagination occur; but he was rarely happy in his choice of subjects, and his execution is constantly marred by want of polish and form.

The standard edition of Saint-Amant, with life, notes, &c., is that in the "Bibliothèque Elzévirienne" by M. C. L. Livet (2 vols., Paris, 1855).

ST ANDREWS, a city, royal burgh, university town, and seaport of Scotland, in the county of Fife, is situated on a bay of the German Ocean and on a branch of the North British Railway, 9 miles east of Cupar and 11 south-south-east of Dundee. It occupies a platform of sandstone rock about 50 feet in height, running east and west and presenting to the sea a precipitous wall, which has been much encroached on by its action within recent years. The principal streets (North Street, Market Street, and South Street) diverge from the cathedral and run east and west, and Queen Street runs south from the centre of South Street. Many new houses and villas have been

Plan of St Andrews.

recently erected towards the south, north, and west. The prosperity of the city depends primarily on its educational institutions, especially the university. The golf links, which are considered the best in Scotland, and sea-bathing attract many residents and visitors. In the 16th century St Andrews was one of the most important ports north of the Forth, and is said to have numbered 14,000 inhabitants; but it fell into decay after the Civil War, and, although it has much increased in the present century, its trade has not revived to any extent. The harbour, protected by a pier 630 feet in length, affords entrance to vessels of 100 tons burden. The principal imports are wood and coals and the principal exports agricultural pro-

duce. The herring and deep-sea fishing is carried on by about 170 fishermen. The evidences of antiquity in the dwelling-houses are comparatively few. The city was never surrounded by walls, but had several gates, of which that called the West Port still remains. The most prominent ruins are those of the cathedral and the castle (see below). Among the modern public buildings are the town-hall (1858) in the Scottish baronial style, the golf clubhouse, the Gibson and fever hospitals, and the recreation hall (1884). The population of St Andrews in 1801 was only 3263, but by 1881 it had nearly doubled, being 6406. The parliamentary burgh in 1881 numbered 6458.

The cathedral originated partly in the priory of Canons Regular founded to the south-east of the town by Bishop Robert (1122-1159). Martine, who wrote in the end of the 17th century, states that in his time some of the buildings were entire and that considerable remains of others existed, but nearly all traces have now disappeared, with the exception of portions of the abbey wall and the archways, now known as the "Pends," forming the main entrance from the city. The wall is about three-quarters of a mile long and bears turrets at intervals. The cathedral was founded by Bishop Arnold (1159-1162), to supply more ample accommodation for the canons and for the celebration of the worship of the see than was afforded by the church of St Regulus. Of this older building in the Romanesque style, probably dating from the 10th century, there remain the square tower, 108 feet in height, and the choir, of very diminutive proportions. On a plan of the town c. 1530 a chancel appears beyond, and on seals affixed to the city and college charters there are representations of other buildings attached. The cathedral which succeeded the church of St Regulus is represented in full outline in the plan of the town of 1530. It was constructed in the form of a Latin cross, the total length of the building inside the walls being 355 feet, the length of the nave 200, of the choir and lateral aisles 62, and of the lady chapel at the eastern extremity 50. The width at the transepts was 166 feet and of the nave and choir 62. According to Fordun the building was founded in 1159; but before it was finished the see witnessed the succession of eleven bishops, the consecration taking place in the time of Bishop Lamberton (1297-1328) in 1318, when the ceremony was witnessed by Robert the Bruce. When entire it had, besides a central tower, six turrets, of which two at the eastern and one of the two at the western extremity rising to a height of 100 feet still remain. The building was partly destroyed by fire in 1378, and the restoration and further embellishment were completed in 1440. It was stripped of its altars and images in 1559 by the magistrates and inhabitants of the city. It is believed that about the end of the 16th century the central tower gave way, carrying with it the north wall. Since then large portions of the ruins have been taken away for building purposes, and nothing was done to preserve them till 1826. The principal portions now remaining, partly Norman and partly Early English, are the eastern and western gables, the greater part of the southern wall of the nave, and the western wall of the south transept.

Closely connected with the fortunes of the cathedral are those of the castle, the picturesque ruins of which are situated about 250 yards north-west of the cathedral, on a rocky promontory now much worn away by the sea. It is supposed to have been erected by Bishop Roger about the beginning of the 13th century as an episcopal residence, and was strongly fortified. It was frequently taken by the English, and after it had been captured by the Scottish regent in 1336-37 was destroyed lest it should fall into their hands. Towards the close of the century it was rebuilt by Bishop Trail in the form of a massive fortification with a moat on the south and west sides. James I. spent some of his early years within it under the care of Bishop Wardlaw, and it is supposed to have been the birthplace of James III. From a window in the castle Cardinal David Beaton witnessed the burning of Wishart in front of the gate, and shortly afterwards he was murdered within it in his bedroom by a party of Reformers. The castle was taken from the conspirators by the French, among the prisoners captured being John Knox. Some years afterwards it was repaired by Archbishop Hamilton, but in a less massive and substantial form. It had in 1656 fallen into such disrepair that the town council ordered its "sleatts and timmer, redd and lumps" to be devoted to the repair of the pier at the harbour. The principal remains are a portion of the south wall enclosing a square tower, the bottle dungeon below the north-west tower, the kitchen tower, and a curious subterranean passage.

The town church, formerly the church of the Holy Trinity, was originally founded in 1112 by Bishop Turgot. The early building was a beautiful Norman structure, but at the close of the 18th century the whole, with the exception of little else than the square tower and spire, was re-erected in a plain and ungainly style. Within the church Knox preached the sermon which led to the stripping of the cathedral and the destruction of the monastic

buildings. It contains an elaborate monument to Archbishop Sharp. Near the south-west of the town is the ruined northern transept of the chapel of the Dominican monastery founded by Bishop Wishart in 1274; but all traces of the Observantine monastery founded about 1450 by Bishop Kennedy have disappeared, except the well. The church of St Mary on the rock erected by the Culdees is supposed to have stood on the Lady's Craig now covered by the sea; and the foundations of another, also dedicated to the Virgin, to the west of the harbour were discovered in 1860, giving the full outline of the ground-plan of the building.

The university was possibly a development of the "schools" which were in existence as early as the beginning of the 12th century, and were endowed by certain "rents and kune" payable to them from lands in the neighbourhood. Its immediate origin was due to a society formed in 1410 by Lawrence of Lindores, abbot of Scone, Richard Cornwall, archdeacon of Lothian, William Stephen, afterwards archbishop of Dunblane, and a few others, for the instruction of all who chose to attend their lectures. A charter was granted in 1411 by Bishop Wardlaw, who attracted the most learned men in Scotland as professors, and bulls were obtained from the pope in 1413 confirming the charter and constituting it a *studium generale* or university. The lectures were delivered in various parts of the town until 1430, when a building called the "pedagogy" to the Faculty of Arts was granted by the founder of the university. St Salvator's College was founded and richly endowed by Bishop Kennedy in 1456; twelve years later it was granted the power to confer degrees in theology and philosophy, and by the end of the century was regarded as a constituent part of the university. In 1512 the university received a further addition by the foundation of St Leonard's College by Prior John Hepburn and Archbishop Alexander Stuart on the site of buildings which at one time were used as a hospital for pilgrims. In the same year Archbishop Stuart nominally changed the original "pedagogy" into a college and annexed to it the parish church of St Michael of Tarvet; but its actual erection into a college did not take place until 1587. By a bull obtained from Paul III. it was dedicated to the Blessed Virgin Mary of the Assumption. The outline of the ancient structure is preserved, but the general character of the buildings has been much altered by various restorations. They form two sides of a quadrangle, the library and principal's residence being on the north and the lecture-rooms and old dining-hall on the west. The university library, which now includes the older college libraries, was founded about the middle of the 17th century, rebuilt in 1764, and improved in 1829. The lower hall in the older part of the building has been used as a provincial meeting-place for the Scottish parliament. When the constitution of the colleges was remodelled in 1579 St Mary's was set apart to theology; and in 1747 the colleges of St Salvator and St Leonard were formed into the United College. The buildings of St Leonard's are now occupied as a high class school for girls. The college chapel is in ruins. The United College occupies the site of St Salvator's College, but the old buildings have been removed, with the exception of the college chapel, now used as the university chapel and the parish church of St Leonard's, a fine Gothic structure containing an elaborate tomb of Bishop Kennedy; the entrance gateway with the square clock tower rising to a height of 152 feet; and the janitor's house, with some class-rooms above. The modern building, in the Elizabethan style, forming two sides of a quadrangle, was erected between the years 1827 and 1847. The Madras College was founded and endowed by Dr Andrew Bell. It is attended by about 700 pupils. There are also several large boarding and day schools.

St Andrews (see SCOTLAND) is said to have been made a bishopric in the 9th century, and when in 908 the Pictish and Scottish Churches were united the primacy was transferred to it from Dunkeld, its bishops being henceforth known as bishops of Alban. Turgot, who was appointed in 1109, was the first bishop who really filled the see. It became an archbishopric during the primacy of Patrick Graham (1466-78). This ceased in 1688. It was created a royal burgh by David I. in 1124. The St Andrews district of burghs returns one member to the House of Commons.

Soc. Antiq. Scot.*, 1862-63; *Histories of St Andrews by Lyon (1848) and Rogers (1849)*; Skene, *Celtic Scotland*. (T. F. H.)

ST ASAPH, a city and parliamentary borough of North Wales, in the county of Flint, is situated on an eminence in the Vale of Clwyd, near the junction of the Clwyd and Elwy, about 6 miles south-south-east of Rhyl and 6 north-north-west of Denbigh. It is somewhat irregularly built and has an antique appearance. On the brow of the hill is an encampment, *Bron-y-Wylva*, supposed to have been occupied by the Roman forces under Suetonius Paulinus. According to tradition the cathedral occupies the site of a church and monastery founded by St Kentigern about 560, when he fled from Strathclyde. It was originally called Llan-Elwy, the church on the Elwy. It is uncertain whether the first bishop was Kentigern or Asaph, to whom Kentigern committed the charge of the church and monastery when he returned to Scotland. The ancient wooden structure was burnt down by the English in 1245; and again in 1278 the same fate befell the building. A third edifice was in great part destroyed during the wars of Owen Glendower in 1402. The greater part of the present building was constructed by Bishop Redman about 1480; the choir and chancel underwent restoration from the designs of Sir Gilbert Scott in 1867-68, and the nave in 1875, when a new roof was added. It is one of the smallest cathedrals in Britain, its total length being 182 feet, while the breadth across the transepts is 108 feet. It is a plain cruciform structure, chiefly Decorated, but with some Early English portions, with an embattled tower, 97 feet in height, rising from the intersection of the nave and the transept. In the south transept there is a library of nearly 2000 volumes, including some rare and valuable books. The bishop's palace is a comparatively modern structure. The town has a grammar-school (1882), county court offices, the union workhouse, and almshouses. The population of the borough (area, 1155 acres) in 1881 was 1901 and of the parish 3177.

ST AUGUSTINE, a city of the United States, capital of St John's county, Florida, has the distinction of being the oldest city in the States built by Europeans, and has recently become a popular winter watering-place. By rail it is 36 miles south-east from Jacksonville. It stands on a narrow sandy peninsula, not more than 12 feet above the sea, formed by the Matanzas and San Sebastian rivers, and is separated from the ocean by the northern end of Anastasia Island. The streets are very narrow, the principal thoroughfares being only 12 or 15 feet wide, and the balconies of the old houses often project so as almost to meet overhead. Along the sea-front for nearly a mile extends a granite-coped sea-wall (1837-43), which forms a fine promenade. At its northern end stands the old fort of San Marco (now Fort Marion), a well-preserved specimen of Spanish military architecture (finished 1756), with moat and outworks, walls 21 feet high, bastions at the corners, heavy casemates, dungeons, and subterranean passages. It is in the form of a trapezium, and covers about 4 acres. Like most of the Spanish buildings, it is constructed of coquina, a curious shelly conglomerate from Anastasia Island, which was easily quarried, but grew very hard on exposure to the atmosphere. The same material was used for paving the streets, which were thus kept extremely clean and firm. At the southern end of the sea-wall is the old Franciscan monastery, now used as United States barracks. Of the Spanish wall which ran across the peninsula and defended the city on the north side there only remains the so-called city gate. In the centre of St Augustine is the Plaza de la Constitucion, which takes its name from the monument in the middle, erected in 1812 in memory of the Liberal Spanish Constitution. On this square stand the cathedral (1793), with a Moorish belfry, the old governor's palace, now used as a post-office and public library, and an Episcopal church in modern Gothic. Other buildings of note in the town are the convent of St Mary and the convent of the sisters of St Joseph. Modern villas and hotels have recently been erected in various parts. Palmetto straw goods are largely manufactured in St Augustine, the palmetto being one of the characteristic features of the surrounding landscape, to which orange and lemon trees also contribute. The climate is remarkably equable, the mean temperature for winter being 58°, and for the other seasons 68°, 80°, and 71° respectively. Frosts seldom occur, though that of 1835 killed many of the orange-

trees. In 1880 the total population of the city was 2293, but in winter northern visitors swell the number to 7000 or 8000.

Menendez de Aviles arrived off the coast of Florida on 28th August (St Augustine's day) 1565, and accordingly he gave the name of that saint to the city which he shortly afterwards founded. His first act was to attack the French settlement on St John's river, and two years later the French retaliated on St Augustine (see FLORIDA, vol. ix. 340, and RIBAUT). In 1586 Drake attacked and plundered the town, and throughout the 17th century it frequently suffered from the raids of Indians, pirates, and the English settlers of South Carolina and Georgia. Occupied by the British from 1763 to 1783, it ultimately passed to the United States in 1821. During the Civil War it changed hands three times.

ST BARTHOLOMEW, or ST BARTHÉLEMY, a French island of the West Indies, in the archipelago of the Antilles, is situated in 17° 55' 35" N. lat. and 63° 60' 15" W. long., 108 miles north-north-west of Guadaloupe, of which, politically, it is a dependency. In form it is very irregular and the surface is mountainous. The soil, in spite of a scarcity of moisture, is not unfertile; and in some of the valleys the growing of vegetables is an important industry. Bananas, cassia, tamarinds, and sassafras are exported. In modern times zinc and lead ores have been found in the island, but they are not worked. Rocks and shallows make St Bartholomew difficult of access, and its port (Le Carénage), though safe during the greater part of the year, is capable of receiving only the larger class of coasting vessels. The chief town is Gustavia, near the port. The population was 2942 in 1883.

St Bartholomew, occupied by the French in 1648, was ceded to Sweden in 1784; but it was restored to France by the treaty signed at Paris, August 1877, with the full approval of the inhabitants, who had remained French in language and manners. Universal suffrage was introduced in 1830 and slavery abolished in 1848.

ST BRIEUC, a town of France, chef-lieu of the department of Côtes du Nord, 295 miles west of Paris by the railway from Brest, at the junction of a branch to Vannes by Pontivy. It stands 290 feet above the sea, between 1 and 2 miles from the English Channel, where Ligué, on the left bank of the Gouet, serves as its seaport. About 600 vessels, with an aggregate of 27,600 tons, enter or clear per annum; the local shipowners take part especially in the Newfoundland and Iceland fisheries. St Brieuc is an old town with a considerable number of curious houses. The principal articles of trade are grain, flax, hemp, vegetables, honey, cider, butter, and eggs, which are despatched to England, and fish and game, which are sent in considerable quantities to Paris. At the fairs in bygone days the Breton women sold their hair for trifling sums. Nurseries of some size exist at St Brieuc, and in the neighbourhood are quarries of blue granite, giving employment to 300 workmen. St Brieuc is the seat of a bishopric in the province of Rennes, and has a cathedral dating from the 13th century, but partially rebuilt in the 18th, and extensively restored recently. The tombs of the bishops, the modern but delicately carved organ-loft, the tapestries, and the stained-glass windows deserve mention. The old monastery of the Capuchins is occupied by the civil hospital. The monastery of the Cordeliers contains the lycée, a library of 30,000 volumes, and a museum of archæology and natural history, and the convent of the Ursulines has been turned into barracks. The episcopal palace, the prefecture, and the town-house were formerly private mansions, a class of old buildings which is steadily being reduced in number by the opening of new streets. A colossal image of the Virgin looks down upon the town, and the Duguesclin boulevard, on the site of the ramparts, has a statue of that hero. The population in 1881 was 14,869 (commune 17,833).

St Brieuc owes its origin and its name to the missionary St Bricius, who came from Wales in the 5th century, and whose tomb afterwards attracted crowds of pilgrims. The place was defended in

1875 by Olivier de Clisson against the duke of Brittany, and again attacked by the same Clisson in 1394, the cathedral suffering greatly in both sieges. In 1592 the town was pillaged by the Spaniards, in 1601 ravaged by the plague, and in 1628 surrounded by walls, of which no traces remain. Between 1602 and 1708 the states of Brittany several times met at St Brieuc, and during the Reign of Terror Chouans and Blues carried on a ruthless conflict with each other.

ST CATHARINES, a city and port of entry of Ontario, Canada, and the capital of Lincoln county, is situated 12 miles north-west of Niagara Falls and 35 south of Toronto (by water), on the Welland Canal and the Grand Trunk and Welland branch of the Grand Trunk Railway. It is celebrated for its artesian mineral wells, and contains a convent and a marine hospital. The manufacture of flour has long been a staple industry, and the abundant water-power is also utilized in cotton-mills, machine-shops, agricultural implement works, &c. Incorporated as a town in 1845, St Catharines had in 1861 a population of 6284, in 1871 of 7864, and in 1881 of 9631. A city charter was granted in 1875.

ST CHAMOND, a manufacturing town of France, in the department of Loire, 7½ miles east-north-east of St Étienne, at the confluence of the Janon with the Gier (an affluent of the Rhone), and on the railway from St Étienne to Lyons. Besides working a considerable number of coal-mines, St Chamond employs twelve mills in the silk manufacture, and from 12,000 to 15,000 looms (mostly driven by hydraulic machinery) in lace-making, and has a variety of other manufactures. The population was 14,149 in 1881.

St Chamond, founded in the 7th century by St Ennemond or Chamond, archbishop of Lyons, became the chief town of the Jarret, a little principality formed by the valley of the Gier. Silk-milling was introduced in the town in the middle of the 16th century by Gayotti, a native of Bologna, and perfected towards the beginning of the 19th by Richard Chambovet. Remains are found at St Chamond of a Roman aqueduct, which conveyed the waters of the Janon along the valley of the Gier to Lyons.

ST CHARLES, a city of the United States, the county seat of St Charles county, Missouri, is situated on the left or north bank of the Missouri 20 miles from its mouth, and 23 from St Louis by the St Louis and Omaha line of the Wabash, St Louis, and Pacific Railway, which crosses the river by a great iron bridge 6535 feet long, erected in 1871 at a cost of \$1,750,000. Besides one of the largest car-factories in the United States, the industrial establishments of St Charles comprise tobacco-factories, flour-mills, hominy-mills, creameries, woollen-factories, and breweries. St Charles College (Methodist Episcopal), chartered in 1838, the Lindenwood Female College (Presbyterian), the Convent of the Sacred Heart, and the Roman Catholic public library are the principal institutions. In 1850 the inhabitants numbered only 1498; by 1870 they were 5570, and in 1880 5014 (in the township 8417).

A Spanish post was established at St Charles in 1769. As a town it dates from 1809 and as a city from 1849. The first State legislature of Missouri met in the town in 1821 and St Charles continued to be the State capital till 1826.

ST CHRISTOPHER, or St Kitts, one of the Leeward Islands, West Indies, situated in 17° 18' N. lat. and 62° 48' W. long. Its length is 23 miles, its greatest breadth 5 miles, and the total area 68 square miles. Mountains traverse the central part from south-east to north-west, the greatest height, Mount Misery, being about 4100 feet above sea-level. On the seaboard is Basseterre, the capital, the outlet of a fertile plain, which contains the cultivated land. The thermometer ranges from 78° to 84° Fahr. St Christopher is united with Nevis (*q.v.*) as one colony, with one executive and one legislative council (official and nominated) for the united presidency. In 1883 the revenue and expenditure were £34,000 and £33,000 respectively,

and the public debt was £2500. The tonnage entering and clearing was 307,000, and the imports and exports were valued at £190,000 and £240,000 respectively per annum. The sugar exports amounted to 10,000 tons. The population of the island was about 30,000.

ST CLAIR, a borough of the United States, in Schuylkill county, Pennsylvania, 3 miles east of Pottsville on the Reading and Philadelphia Railroad. It mainly depends on its coal-mines. The population was 5726 in 1870 and 4149 in 1880.

ST CLOUD, a village of France, on the left bank of the Seine, 7 miles west from the centre of Paris and $9\frac{1}{2}$ by the railroad from Paris to Versailles, forming part of the canton of Sèvres and of the arrondissement of Versailles (Seine-et-Oise). Picturesquely built on a hill-slope, it overlooks the river, the Bois de Boulogne, and Paris; and, lying amid the foliage of its magnificent park and numerous villa gardens, it is one of the favourite resorts of the Parisians. The palace of St Cloud, which had been a summer residence for Napoleon I., Louis XVIII., Charles X., Louis Philippe, and Napoleon III., was burned by the Prussians in 1870 along with part of the village. In spite of the damage inflicted on the park at the same period, magnificent avenues still make it one of the finest rural haunts in the neighbourhood of Paris. It occupies a varied tract of 960 acres, and abounds in picturesque views. Every year in September a great fair, lasting three weeks, is held in the park; and within its precincts are situated the new national Sèvres porcelain manufacture and the Breteuil pavilion, the seat of the international metre commission. St Cloud possesses a church, erected about 1865, in the style of the 12th century, with an elegant stone spire; and here too has been established the upper normal school (science and letters) for the training of teachers (male) for the provincial normal schools of primary instruction. The population in 1881 was 4081, and 4126 in the commune.

Clodoald or Cloud, grandson of Clovis, adopted the monastic life and left his name to the spot where his tomb was discovered after the lapse of 1200 years, in a crypt near the present church. He had granted the domain to the church of Paris, which possessed it as a fief till the 18th century. At St Cloud Henry III. and the king of Navarre (Henry IV.) established their camp during the League for the siege of Paris; and there the former was assassinated by Jacques Clément. The castle was at that time only a plain country house belonging to Pierre de Gondi, archbishop of Paris. Louis XIV. bought it for his brother, the duke of Orleans, who was the originator of the palace which perished in 1870. Peter the Great of Russia was received there in 1717 by the regent, whose grandson sold the palace to Marie Antoinette. It was in the orangery at St Cloud that Bonaparte executed the *coup d'état* of 18th Brumaire; and after he became emperor the palace was his favourite residence, and there he celebrated his marriage with Marie Louise. In 1815 it was the scene of the signing of the capitulation of Paris; and in 1830 from St Cloud Charles X. issued the orders which brought about his fall. Napoleon III. was there when he received the *senatusconsultum* which restored the empire in his favour (1st December 1852). Seized by the Prussians at the commencement of the investment of Paris in 1870, St Cloud was sacked during the siege.

ST CROIX, or SAINTE CROIX, one of the Danish West India Islands, is situated between 17° and 18° N. lat., about 40 miles south-south-east of St Thomas. Twenty-three miles long, and with a maximum width of 6 miles, it has an area estimated at 51,168 acres. Blue Mountain, the highest peak (1100 feet), lies in the range of hills running parallel with the coast in the western half of the island. The narrower eastern end is also hilly. In the centre and towards the west the surface is undulating, and towards the south flat with brackish lagoons. With the exception of about 4000 acres, the soil is everywhere productive; but only about one-third of the area is devoted to sugar-growing and one-sixth to pasture-land, the greater part of the remainder being either worthless brush-

wood (the haunt of small deer) or scanty timber. Besides little Negro hamlets there are two garrison towns—Christiansted (or popularly Bassin) on the north coast, with a small harbour 15 to 16 feet deep at the entrance, and Frederiksted (popularly West End) on the west coast, with an open roadstead. The population of the island was 23,194 in 1860, 22,760 in 1870, and 18,430 in 1880. This decrease is due to the comparative failure of the sugar-crops. Destruction of the forests (or some unsuspected cause) has brought diminished rainfall (from 20 to 34 inches per annum); and the belt of abandoned cane-ground has been steadily increasing. To help in checking this decay the Government constructed (1876) a great central factory, to which the juice is conveyed from the plantations by a system of pipes. Apart from the official element (mostly Danish), the white inhabitants of St Croix are almost wholly British either by birth or descent.

St Croix was discovered by Columbus on his second voyage. In 1651 France entrusted it to the Knights of Malta, and in 1733 it was purchased by Denmark for 750,000 livres (167,000 rixdollars). Slavery was abolished in 1848, and coolies began to be employed in 1863.

ST CYR, MARSHAL (1764-1830). See GOUVION ST CYR.

ST CYR-L'ÉCOLE, a village of France (Seine-et-Oise), $2\frac{1}{2}$ miles west of Versailles at the end of the old park of Louis XIV. It had only 2712 inhabitants in 1881, and its importance is solely due to the famous military school now established in the convent which Madame de Maintenon founded for the education of noble young ladies in indigent circumstances. It was here that Racine's *Esther* and *Athalie* were first acted, having been written expressly for the pupils. Madame de Maintenon's tomb is still preserved in the chapel. The convent was suppressed at the Revolution, and the gardens are now partly transformed into parade-grounds. Two advanced forts of the new enceinte round Paris are situated at St Cyr.

ST DAVID'S, a village of Pembrokeshire, South Wales, and the seat of a bishopric, is situated in the valley of the Alan, 16 miles north-west of Haverfordwest, the nearest railway station, and $1\frac{1}{2}$ miles east from the most westerly point of Wales. By some it is supposed to be the Roman Menapia. It consists of straggling and somewhat mean houses, occupying the crest of the hill above the cathedral. It was the birthplace of St David, the patron saint of Wales. The see, which includes nearly the whole of South Wales, was founded at least not later than the 7th century. Till the middle of the 12th century the bishops had archiepiscopal powers. The existing cathedral was begun in 1180. Its tower fell in 1220, crashing through the choir and transepts; when it was rebuilt the old western arch was retained. About the time the choir and transepts were repaired St Thomas's chapel was added. In 1248 an earthquake caused the walls of the nave to bulge. The chapels east of the presbytery were begun about this period, and the lady chapel between 1296 and 1328. The aisles of the nave and of the presbytery were raised by Bishop Gower (1328-1347), who set up the beautiful stone rood screen. The great window in the south transept in the Perpendicular style was erected in 1384, and the roofs renewed in the Late Perpendicular between 1461 and 1522. The west front was rebuilt by Nash about the end of the 18th century, and in 1862 extensive restorations, including the rebuilding of the two western piers of the tower and of the west front, were begun under the direction of Sir G. G. Scott. The cathedral contains the tomb of Edmund Tudor, father of Henry VII., and the shrine of St David. The total internal length of the building is 298 feet, the breadth of the nave (with aisles) 70 feet, and the breadth of the transepts 27 feet 3 inches. Parts of the rich interior decoration of the

nave are particularly worthy of notice. To the north of the cathedral are the picturesque ruins of the chapel of St Mary's College, founded in 1377. On the other side of the Alan are the remains of the bishop's palace, a masterpiece of Bishop Gower, particularly noteworthy for the beautiful arcade and parapet running round the whole building. It was partly unroofed by Bishop Barlow in 1536. In the centre of the village stands the ancient cross, 28 feet high, the steps of which were restored by Bishop Thirlwall in 1873. The place is without municipal government, its mayor being the officer of the bishop's manorial court. The population of the parish in 1881 was 2053.

ST DENIS, a town of France, in the department of Seine, 4½ miles north of Paris by the Northern Railway, which there divides into two branches leading respectively to Pontoise and Creil, is now a great manufacturing centre for machinery, boats, railway carriages, chemical products, printed goods, candles, beer, leather, and flour. Many of the works are supplied with water from the Crould and the Rouillon, which there fall into the Seine; and a canal extends from the Seine to La Villette, the great inner harbour of Paris. In 1881 the population was 43,127. The name and fame of the town are derived from the abbey founded by Dagobert on the spot where St Denis, the apostle of Paris, was interred (see below). The west front was built between 1137 and 1140. The right-hand tower is almost pure Romanesque; that on the left was Gothic, and its spire was carried to a height of 280 feet, but it was struck by lightning in 1837 and its reconstruction effected in so clumsy a manner that it had to be taken down till it was on a level with the roof of the nave. The rose window, now occupied by a clock face, dates from the 13th century. Under one of the three rows of arches above the main entrance runs an inscription recording the erection of the church by Suger with abbatial funds and its consecration in 1140. The porch formed by the first three bays of the church contains some remains of the basilica of Pippin the Short. The nave proper (235 feet long and 57 wide) has seven bays, and dates, as well as most of the choir and transepts, from the reign of St Louis. The gallery of the triforium is of open work and is filled in with glass. The secondary apse (*rond-point*) and its semicircular chapels (consecrated on 11th June 1144) are considered as the first perfected attempt at Gothic. The transepts have fine 13th-century façades, each with two unfinished towers; if the plan had been fully carried out there would have been six towers besides a central *flèche* in lead. In the chapels of the nave are the tombs of Louis XII. and Anne of Brittany (1591); of Henry II. and Catherine de' Medici, a masterpiece by Germain Pilon; of Louis of Orleans and Valentine of Milan, from the old church of the Celestines at Paris; of Francis I. and Claude of France, one of the most splendid tombs of the Renaissance, executed under the direction of Philibert Delorme; and that of Dagobert, which, though considerably dilapidated, ranks as one of the most curious of mediæval (13th-century) works of art. In the apse some stained glass of the time of Suger still remains. The crypt dates partly from Charlemagne and partly from Suger. In the centre is the vault where the coffin of the dead king used to lie until, to make room for that of his successor, it was removed to its final resting-place. It is at present occupied by the coffin of Louis XVIII., the last sovereign whose body was borne to St Denis and the only one whose ashes have been respected. Besides some fine statues, the crypt contains the Bourbon vault, in which were deposited the remains of Louis XVI. and Marie Antoinette, or at least whatever of them was recoverable from the cemetery of La Madeleine, where the Chapelle

Expiatoire now stands. The treasury of St Denis has been despoiled of its richest possessions, including the books now in the National Library; but it still contains crosses, altar-pieces, and reliquaries, notably those of St Denis and his two companions, Rusticus and Eleutherius, the three patrons of the basilica. The chapter of St Denis is usually composed of emeritus bishops with the title of canons; but the institution is about to be abolished (1886). St Denis possesses a fine town-house and a poor-house (300 beds). Its three forts formed part of the Parisian enceinte in 1870-71, and from 23d to 26th January 1871 the place was bombarded by the Prussians, who did considerable damage to the basilica.

St Denis, the ancient Catulliacum, was a town of no pretensions till the founding of its abbey. The process of rebuilding begun in the 12th century by Abbé Suger was completed under Philip the Bold. In the meantime St Louis caused mausoleums to be erected with figures of the princes already buried in the abbey; and from his time onwards to Henry II. every monarch in succession had his monument. Louis XIV. reduced the abbey to the rank of a priory; and at the Revolution it was suppressed, the tombs being violated and the church sacked (1793). Two years later all the remains and fragments that could be recovered were collected in the museum of the Petits Augustines at Paris; but the bronze tombs had been melted down, the stained-glass windows shattered, and large numbers of interesting objects stolen or lost. Napoleon established in the monastery a school for daughters of the members of the Legion of Honour, which has continued to flourish. Louis XVIII. caused all the articles belonging to St Denis to be brought back from the museums to their original site, and added numerous other monuments from the suppressed abbeys. But it was not till after 1848 that, under the intelligent direction of Viollet le Duc, the damage inflicted by revolutionist and unskilful restorer was repaired and the basilica recovered its original appearance. Charles the Bold instituted the famous fair of Landit, which was transferred from the neighbouring plain to St Denis itself in 1552, and is still held in the town. Sheep and parchment were formerly the staples. The abbey was pillaged by Charles the Bad, king of Navarre, in 1358, by the Burgundians and Flemings in 1411, and by the English in 1430. A sanguinary battle, in which the Catholic leader Constable Anne de Montmorency found victory and death, was fought between Huguenots and Catholics in the neighbourhood on 10th November 1567.

ST DENIS, the capital of RÉUNION (*q.v.*).

ST DIÉ, a town of France, chef-lieu of an arrondissement and a bishop's see in the department of Vosges, is situated on the right bank of the Meurthe, 1030 feet above the sea, on the railway from Lunéville (32 miles north-west) to Épinal (38 miles south-west). One portion of the town was rebuilt after the fire of 1757 in the regular and monumental style of Nancy; the other has a somewhat mean appearance. Several Alsatian manufacturers having emigrated to St Dié on the annexation of their country to Germany, the town has made great progress since 1871, and now possesses weaving factories, bleacheries, hosiery factories, engineering works, a tile work, and an extensive brewery. The cathedral has a Romanesque nave (10th century) and a Gothic choir; the portal, in red sandstone, dates from the 18th century. A fine cloister, recently restored and containing a beautifully executed stone pulpit, leads to the Petite Église or Notre Dame, a well-preserved specimen of early Romanesque. Other points of interest are the library, the museum, belonging to the Société Philomathique Vosgienne, the large schools, and the public fountains. The town commands an extensive view of the Vosges and is a convenient centre for excursions. The population in 1881 was 12,677 (15,312 in the commune).

St Dié (*Deodatum*, *Theodata*, *S. Deodati Fanum*) grew up round a monastery founded in the 6th century by St Deodatus of Nevers, who gave up his episcopal functions in order to retire to this place. In the 10th century the community became a chapter of canons; and among those who subsequently held the rank of provost or dean were Giovanni de' Medici (afterwards Pope Leo X.) and several princes of the house of Lorraine. Among the extensive privileges enjoyed by them was that of coining money. Though they co-operated in building the town walls, the canons and the dukes of

Lorraine soon became rival competitors for the authority over St Dié. The institution of a town council in 1628, and the establishment under King Stanislaus of a bishopric which appropriated part of their spiritual jurisdiction, contributed greatly to diminish the influence of the canons; and with the Revolution they were completely swept away. During the 17th century the town was repeatedly sacked by the Burgundians under Charles the Bold, by the French, and by the Swedes. It was also partially destroyed by fire in 1065, 1155, 1554, and 1757. St Dié was the seat of a very early printing press.

SAINTE-BEUVE, CHARLES AUGUSTIN (1804-1869), the most notable critic of our time, was born at Boulogne-sur-Mer on 23d December 1804. He was a posthumous child,—his father, a native of Picardy, and controller of town-dues at Boulogne, having married in this same year, at the age of fifty-two, and died before the birth of his son. The father was a man of literary tastes, and used to read, like his son, pencil in hand; his copy of the Elzevir edition of Virgil, covered with his notes, was in his son's possession, and is mentioned by him in one of his poems. Sainte-Beuve's mother was half English,—her father, a mariner of Boulogne, having married an Englishwoman. The little Charles Augustin was brought up by his mother, who never remarried, and an aunt, his father's sister, who lived with her. They were poor, but the boy, having learnt all he could at his first school at Boulogne, persuaded his mother to send him, when he was near the age of fourteen, to finish his education at Paris. He boarded with a M. Landry, and had for a fellow-boarder and intimate friend Charles Neate, afterwards fellow of Oriel College and member of parliament for the city of Oxford. From M. Landry's boarding-house he attended the classes, first of the Collège Charlemagne, and then of the Collège Bourbon, winning the head prize for history at the first, and for Latin verse at the second. In 1823 he began to study medicine, and continued the study with diligence and interest for nearly four years, attending lectures on anatomy and physiology and walking the hospitals. But meanwhile a Liberal newspaper, the *Globe*, was founded in 1827 by M. Dubois, one of Sainte-Beuve's old teachers at the Collège Charlemagne. M. Dubois called to his aid his former pupil, who, now quitting the study of medicine, contributed historical and literary articles to the *Globe*, among them two, which attracted the notice of Goethe, on Victor Hugo's *Odes and Ballads*. These articles led to a friendship with Victor Hugo and to Sainte-Beuve's connexion with the romantic school of poets, a school never entirely suited to his nature. In the *Globe* appeared also his interesting articles on the French poetry of the 16th century, which in 1828 were collected and published in a volume, and followed by a second volume containing selections from Ronsard. In 1829 he made his first venture as a poet with the *Vie, Poésies, et Pensées de Joseph Delorme*. His own name did not appear; but Joseph Delorme, that "Werther in the shape of Jacobin and medical student," as Guizot called him, was the Sainte-Beuve of those days himself. About the same time was founded the *Revue de Paris*, and Sainte-Beuve contributed the opening article, with Boileau for its subject. In 1830 came his second volume of poems, the *Consolations*, a work on which Sainte-Beuve looked back in later life with a special affection. To himself it marked and expressed, he said, that epoch of his life to which he could with most pleasure return, and at which he could like best that others should see him. But the critic in him grew to prevail more and more and pushed out the poet. In 1831 the *Revue des Deux Mondes* was founded in rivalry with the *Revue de Paris*, and from the first Sainte-Beuve was one of the most active and important contributors. He brought out his novel of *Volupté* in 1834, his third and last volume of poetry, the *Pensées d'Août*, in 1837.

He himself thought that the activity which he had in the meanwhile exercised as a critic, and the offence which in some quarters his criticism had given, were the cause of the less favourable reception which this volume received. He had long meditated a book on Port Royal. At the end of 1837 he quitted France, accepting an invitation from the academy of Lausanne, where in a series of lectures his work on Port Royal came into its first form of being. In the summer of the next year he returned to Paris to revise and give the final shape to his work, which, however, was not completed for twenty years. In 1840 M. Cousin, then minister of public instruction, appointed him one of the keepers of the Mazarin Library, an appointment which gave him rooms at the library, and, with the money earned by his pen, made him for the first time in his life easy in his circumstances, so that, as he afterwards used to say, he had to buy rare books in order to spend his income. A more important consequence of his easier circumstances was that he could study freely and largely. He returned to Greek, of which a French schoolboy brings from his *lycée* no great store. With a Greek teacher, M. Pantasides, he read and re-read the poets in the original, and thus acquired, not, perhaps, a philological scholar's knowledge of them, but a genuine and invaluable acquaintance with them as literature. His activity in the *Revue des Deux Mondes* continued, and articles on Homer, Theocritus, Apollonius of Rhodes, and Meleager were fruits of his new Greek studies. He wrote also a very good article in 1844 on the Italian poet Leopardi; but in general his subjects were taken from the great literature which he knew best, that of his own country,—its literature both in the past and in the contemporary present. Seven volumes of "Portraits," contributed to the *Revue de Paris* and the *Revue des Deux Mondes*, exhibit his work in the years from 1832 to 1848, a work constantly increasing in range and value. In 1844 he was elected to the French Academy as successor to Casimir Delavigne, and was received there at the beginning of 1845 by Victor Hugo.

From this settled and prosperous condition the revolution of February 1848 dislodged him. In March of that year was published an account of secret-service money distributed in the late reign, and Sainte-Beuve was put down as having received the sum of one hundred francs. The smallness of the sum would hardly seem to suggest corruption; it appears probable that the money was given to cure a smoky chimney in his room at the Mazarin Library, and was wrongly entered as secret-service money. But Sainte-Beuve, who piqued himself on his independence and on a punctilious delicacy in money matters, was indignant at the entry, and thought the proceedings of the minister of public instruction and his officials, when he demanded to have the matter sifted, tardy and equivocal. He resigned his post at the Mazarin and accepted an offer from the Belgian Government of a chair of French literature in the university of Liège. There he gave the series of lectures on Chateaubriand and his contemporaries which was afterwards (in 1861) published in two volumes. He liked Liège, and the Belgians would have been glad to keep him; but the attraction of Paris carried him back there in the autumn of 1849. Louis Napoleon was then president. Disturbance was ceasing; a time of settled government, which lasted twenty years and corresponds with the second stage of Sainte-Beuve's literary activity, was beginning. Dr Véron, the editor of the *Constitutionnel*, proposed to him that he should supply that newspaper with a literary article for every Monday; and thus the *Causeries du Lundi* were started. They at once succeeded, and "gave the signal," as Sainte-Beuve himself says with truth, "for the return of letters." Sainte-Beuve now lived in the small house in the Rue Mont-Parnasse (No. 11) which he occu-

pired for the remainder of his life, and where in 1850 his mother, from whom he seems to have inherited his good sense, tact, and finesse, died at the age of eighty-six. For three years he continued writing every Monday for the *Constitutionnel*; then he passed, with a similar engagement, to the *Moniteur*. In 1857 his Monday articles began to be published in volumes, and by 1862 formed a collection in fifteen volumes; they afterwards were resumed under the title of *Nouveaux Lundis*, which now make a collection of thirteen volumes more. In 1854 M. Fortoul nominated him to the chair of Latin poetry at the College of France. His first lecture there was received with interruptions and marks of disapprobation by many of the students, displeased at his adherence to the empire; at a second lecture the interruption was renewed. Sainte-Beuve had no taste for public speaking and lecturing; his *frontis mollities*, he said, unfitted him for it. He was not going to carry on a war with a party of turbulent students; he proposed to resign, and when the minister would not accept his resignation of his professorship he resigned its emoluments. The *Étude sur Virgile*, a volume published in 1857, contains what he had meant to be his first course of lectures. He was still a titular official of public instruction; and in 1858 his services were called for by M. Rouland, then minister of public instruction, as a lecturer (*maître de conférences*) on French literature at the École Normale Supérieure. This work he discharged with assiduity and success for four years. In 1859 he was made commander of the Legion of Honour, having twice previously to 1848 refused the cross. During the years of his official engagement his Monday contributions to the *Moniteur* had no longer been continuous; but in 1862 an arrangement was proposed by which he was to return to the *Constitutionnel* and again supply an article there every Monday. He consented, at the age of fifty-seven, to try this last pull, as he called it, this "dernier coup de collier"; he resigned his office at the École Normale and began the series of his *Nouveaux Lundis*. They show no falling off in vigour and resource from the *Causeries*. But the strain upon him of his weekly labour was great. "I am not a *monsieur* nor a gentleman," he writes in 1864, "but a workman by the piece and by the hour." "I look upon myself as a player forced to go on acting at an age when he ought to retire, and who can see no term to his engagement." He had reason to hope for relief. Except himself, the foremost literary men in France had stood aloof from the empire and treated it with a hostility more or less bitter. He had not been hostile to it: he had accepted it with satisfaction, and had bestowed on its official journal, the *Moniteur*, the lustre of his literature. The prince Napoleon and the princess Mathilde were his warm friends. A senatorship was mentioned; its income of £1600 a year would give him opulence and freedom. But its coming was delayed, and the strain upon him continued for some time longer. When at last in April 1865 he was made senator, his health was already seriously compromised. The disease of which he died, but of which the doctors did not ascertain the presence until his body was opened after his death—the stone—began to distress and disable him. He could seldom attend the meetings of the senate; the part he took there, however, on two famous occasions, when the nomination of M. Renan to the College of France came under discussion in 1867 and the law on the press in the year following, provoked the indignation of the great majority in that conservative assembly. It delighted, however, all who "belonged," to use his own phrase, "to the diocese of free thought"; and he gave further pleasure in this diocese by leaving at the beginning of 1869 the *Moniteur*, injudiciously managed by the Government and M. Rouher, and contributing to a

Liberal journal, the *Temps*. His literary activity suffered little abatement, but the attacks of his malady, though borne with courage and cheerfulness, became more and more severe. Pain made him at last unable to sit to write; he could only stand or lie. He died in his house in the Rue Mont Parnasse on the 13th of October 1869. He had inherited an income of four thousand francs a year from his mother, and he left it six thousand; to the extent of eighty pounds a year and no further had literature and the senatorship enriched him. By his will he left directions that his funeral was to be without religious rites, quite simple, and with no speeches at the grave except a few words of thanks from one of his secretaries to those present. There was a great concourse; the Paris students, who had formerly interrupted him, came now to do honour to him as a Liberal and a champion of free thought—a senator they could not but admit—undeniably, alas, a senator, but *oh, si peu!* Yet his own account of himself is the best and truest,—an account which lays no stress on his Liberalism, no stress on his championship of free thought, but says simply: "Devoted to my profession as critic, I have tried to be more and more a good, and, if possible, an able workman."

The work of Sainte-Beuve divides itself into three portions—his poetry, his criticism before 1848, and his criticism after that year. His novel of *Volupté* may properly go with his poetry.

We have seen his tender feeling for his poetry, and he always maintained that, when the "integrating molecule," the foundation of him as a man of letters, was reached, it would be found to have a poetic character. And yet he declares, too, that it is never without a sort of surprise and confusion that he sees his verses detached from their context and quoted in public and in open day. They do not seem made for it, he says. This admirable critic knew, indeed, what a Frenchman may be pardoned for not willingly perceiving, and what even some Englishmen try to imagine that they do not perceive, the radical inadequacy of French poetry. For us it is extremely interesting to hear Sainte-Beuve on this point, since it is to English poetry that he resorts in order to find his term of comparison, and to award the praise which to French poetry he refuses. "Since you are fond of the poets," he writes to a friend, "I should like to see you read and look for poets in another language, in English for instance. There you will find the most rich, the most dulcet, and the most new poetical literature. Our French poets are too soon read; they are too slight, too mixed, too corrupted for the most part, too poor in ideas even when they have the talent for strophe and line, to hold and occupy for long a serious mind." And again: "If you knew English you would have treasures to draw upon. They have a poetical literature far superior to ours, and, above all, sounder, more full. Wordsworth is not translated; these things are not to be translated; you must go to the fountain-head for them. Let me give you this advice: learn English."

But, even as French poetry, Sainte-Beuve's poetry had faults of its own. Critics who found much in it to praise yet pronounced it a poetry "narrow, puny, and stifled," and its style "slowly dragging and laborious." Here we touch on a want which must no doubt be recognized in him, which he recognized in himself, and whereby he is separated from the spirits who succeed in uttering their most highly inspired note and in giving their full measure,—some want of flame, of breath, of pinion. Perhaps we may look for the cause in a confession of his own: "I have my weaknesses; they are those which gave to King Solomon his disgust with everything and his satiety with life. I may have regretted sometimes that

I was thus extinguishing my fire, but I did not ever pervert my heart." It is enough for us to take his confession that he extinguished or impaired his fire.

Yet his poetry is characterized by merits which make it readable still and readable by foreigners. So far as it exhibits the endeavour of the romantic school in France to enlarge the vocabulary of poetry and to give greater freedom and variety to the alexandrine, it has interest chiefly for readers of his own nation. But it exhibits more than this. It exhibits already the genuine Sainte-Beuve, the author who, as M. Duvergier de Hauranne said in the *Globe* at the time, "sent à sa manière et écrit comme il sent," the man who, even in the forms of an artificial poetry, remains always "un penseur et un homme d'esprit." That his Joseph Delorme was not the Werther of romance, but a Werther in the shape of Jacobin and medical student, the only Werther whom Sainte-Beuve by his own practical experience really knew, was a novelty in French poetical literature, but was entirely characteristic of Sainte-Beuve. All his poetry has this stamp of direct dealing with common things, of plain unpretending reality and sincerity; and this stamp at that time made it, as Béranger said, "a kind of poetry absolutely new in France." It found, therefore, with all its shortcomings, friends in men so diverse as Béranger, Lamartine, Jouffroy, Beyle. Whoever is interested in Sainte-Beuve should turn to it, and will be glad that he has done so.

It has been the fashion to disparage the criticism of the *Critiques et Portraits Littéraires*, the criticism anterior to 1848, and to sacrifice it, in fact, to the criticism posterior to that date. Sainte-Beuve has himself indicated what considerations ought to be present with us in reading the *Critiques et Portraits*, with what reserves we should read them. They are to be considered, he says, "rather as a dependency of the elegiac and romanesque part of my work than as express criticisms." "The *Revue des Deux Mondes*," he adds, which published them, was young in those days, "mixed a good deal of its wishes and its hopes with its criticism, sought to explain and to stimulate rather than to judge. The portraits there of contemporary poets and romance-writers can in general be considered, whether as respects the painter or as respects the models, as youthful portraits only; *juvenis juvenem pinxit*." They have the copiousness and enthusiasm of youth; they have also its exuberance. He judged in later life Chateaubriand, Lamartine, Victor Hugo, more coolly, judged them differently. But the *Critiques et Portraits* contain a number of articles on personages, other than contemporary French poets and romance-writers, which have much of the soundness of his later work, and, in addition, an abundance and fervour of their own which are not without their attraction. Many of these are delightful reading. The articles on the Greek poets and on Leopardi have been already mentioned. Those on Boileau, Molière, Daunou, and Fauriel, on Madame de la Fayette and Mademoiselle Aïssé, may be taken as samples of a whole group which will be found to support perfectly the test of reading, even after we have accustomed ourselves to the later work of the master. Nay, his soberness and tact show themselves even in this earlier stage of his criticism, and even in treating the objects of his too fervid youthful enthusiasm. A special object of this was Victor Hugo, and in the first article on him in the *Portraits Contemporains* we have certainly plenty of enthusiasm, plenty of exuberance. We have the epithets "adorable," "sublime," "supreme," given to Victor Hugo's poetry; we are told of "the majesty of its high and sombre philosophy." All this is in the vein of Mr George Gilfillan. But the article next following this, and written only four years later, in 1835, is the article of a critic, and takes the points of objection, seizes the weak side of

Victor Hugo's poetry, how much it has of what is "creux," "sonore," "artificiel," "voulu," "théâtral," "violent," as distinctly as the author of the *Causeries* could seize it. "The Frank, energetic and subtle, who has mastered to perfection the technical and rhetorical resources of the Latin literature of the decadence," is a description never to be forgotten of Victor Hugo as a poet, and Sainte-Beuve launches it in this article, written when he was but thirty years old, and still a painter of "portraits de jeunesse" only.

He had thus been steadily working and growing; nevertheless, 1848 is an epoch which divides two critics in him of very unequal value. When, after that year of revolution and his stage of seclusion and labour at Liège, he came back to Paris in the autumn of 1849 and commenced in the *Constitutionnel* the *Causeries du Lundi*, he was astonishingly matured. Something of fervour, enthusiasm, poetry, he may have lost, but he had become a perfect critic—a critic of measure, not exuberant; of the centre, not provincial; of keen industry and curiosity, with "Truth" (the word engraved in English on his seal) for his motto; moreover, with gay and amiable temper, his manner as good as his matter,—the "critique souriant," as, in Charles Monselet's dedication to him, he is called.

Merely to say that he was all this is less convincing than to show, if possible, by words of his own, in what fashion he was all this. The root of everything in his criticism is his single-hearted devotion to truth. What he called "fictions" in literature, in politics, in religion, were not allowed to influence him. Some one had talked of his being tenacious of a certain set of literary opinions. "I hold very little," he answers, "to literary opinions; literary opinions occupy very little place in my life and in my thoughts. What does occupy me seriously is life itself and the object of it." "I am accustomed incessantly to call my judgments in question anew, and to re-cast my opinions the moment I suspect them to be without validity." "What I have wished" (in *Port Royal*) "is to say not a word more than I thought, to stop even a little short of what I believed in certain cases, in order that my words might acquire more weight as historical testimony." To all exaggeration and untruth, from whatever side it proceeded, he had an antipathy. "I turn my back upon the Michelets and Quinets, but I cannot hold out my hand to the Veuillots." When he was writing for the *Moniteur* he was asked by the manager of the paper to review a book by an important personage, a contributor; his answer is a lesson for critics and paints him exactly. "I should like to say yes, but I have an insurmountable difficulty as to this author; he appears to me to compromise whatever he touches; he is violent, and has not the tradition of the things he talks about. Thus his article on Condorcet, which the *Moniteur* inserted, is odious and false; one may be severe upon Condorcet, but not in that tone or in that note. The man has no *insight*—a defect which does not prevent him from having a pen with which at a given moment he can flourish marvellously. But, of himself, he is a gladiator and a desperado. I must tell you, my dear sir, that to have once named him with compliment in some article of mine or other is one of my self-reproaches as a man of letters. Let me say that he has not attacked me in any way; it is a case of natural repulsion."

But Sainte-Beuve could not have been the great critic he was had he not had, at the service of this his love of truth and measure, the conscientious industry of a Benedictine. "I never have a holiday. On Monday towards noon I lift up my head, and breathe for about an hour; after that the wicket shuts again and I am in my prison cell for seven days." The *Causeries* were at this price. They came once a week, and to write one of them as he

wrote it was indeed a week's work. The "irresponsible indolent reviewer" should read his notes to his friend and provider with books, M. Paul Chéron of the National Library. Here is a note dated the 2d of January 1853: "Good-day and a happy New Year. To-day I set to work on Grimm. A little dry; but after St François de Sales" (his Monday article just finished) "one requires a little relief from roses. I have of Grimm the edition of his *Correspondence* by M. Taschereau. I have also the *Memoirs* of Madame d'Épinay, where there are many letters of his. But it is possible that there may be *notices* of him mentioned in the bibliographical book of that German whose name I have forgotten. I should like, too, to have the *first editions* of his *Correspondence*; they came out in successive parts." Thus he prepared himself, not for a grand review article once a quarter, but for a newspaper review once a week.

His adhesion to the empire caused him to be habitually represented by the Orleanists and the Republicans as without character and patriotism, and to be charged with baseness and corruption. The Orleanists had, in a great degree, possession of the higher press in France and of English opinion,—of Liberal English opinion more especially. And with English Liberals his indifference to parliamentary government was indeed a grievous fault in him; "you Whigs," as Croker happily says, "are like quack doctors, who have but one specific for all constitutions." To him either the doctrine of English Liberals, or the doctrine of Republicanism, applied absolutely, was what he called a "fiction," one of those fictions which "always end by obscuring the truth." Not even on M. de Tocqueville's authority would he consent to receive "les hypothèses dites les plus honorables,"—"the suppositions which pass for the most respectable." All suppositions he demanded to sift, to see them at work, to know the place and time and men to which they were to be applied. For the France before his eyes in 1849 he thought that something "solid and stable"—*un mur*, "a wall," as he said—was requisite, and that the government of Louis Napoleon supplied this wall. But no one judged the empire more independently than he did, no one saw and denounced its faults more clearly; he described himself as being, in his own single person, "the *gauche* of the empire," and the description was just.

To these merits of mental independence, industry, measure, lucidity, his criticism adds the merit of happy temper and disposition. Goethe long ago noticed that, whereas Germans reviewed one another as enemies whom they hated, the critics of the *Globe* reviewed one another as gentlemen. This arose from the higher social development of France and from the closer relations of literature with life there. But Sainte-Beuve has more, as a critic, than the external politeness which once at any rate distinguished his countrymen: he has a personal charm of manner due to a sweet and humane temper. He complained of *un peu de dureté*, "a certain dose of hardness," in the new generation of writers. The personality of an author had a peculiar importance for him; the poetical side of his subjects, however latent it might be, always attracted him and he always sought to extricate it. This was because he had in himself the moderate, gracious, amiably *human* instincts of the true poetic nature. "Let me beg of you," he says in thanking a reviewer who praised him, "to alter one or two expressions at any rate. I cannot bear to have it said that I am the *first* in anything whatever, as a writer least of all; it is not a thing which can be admitted, and these ways of classing people give offence." Literary man and loyal to the French Academy as he was, he can yet write to an old friend after his election: "All these academies, between you and me, are

pieces of childishness; at any rate the French Academy is. Our least quarter of an hour of solitary reverie or of serious talk, yours and mine, in our youth, was better employed; but, as one gets old, one falls back into the power of these nothings; only it is well to know that nothings they are."

Perhaps the best way to get a sense of the value and extent of the work done in the last twenty years of his life by the critic thus excellently endowed is to take a single volume of the *Causeries du Lundi*, to look through its list of subjects, and to remember that with the qualities above mentioned all these subjects are treated. Any volume will serve; let us take the fourth. This volume consists of articles on twenty-four subjects. Twenty of these are the following:—Mirabeau and Sophie, Montaigne, Mirabeau and Comte de la Marck, Mademoiselle de Scudéry, André Chénier as politician, Saint-Évremond and Ninon, Joseph de Maistre, Madame de Lambert, Madame Necker, the Abbé Maury, the Duc de Lauzun of Louis XVI.'s reign, Marie Antoinette, Buffon, Madame de Maintenon, De Bonald, Amyot, Mallet du Pan, Marmontel, Chamfort, Ruhlière. Almost every personage is French, it is true; Sainte-Beuve had a maxim that the critic should prefer subjects which he possesses familiarly. But we should recognize more fully than we do the immense importance and interest of French literature. Certain productions of this literature Mr Saintsbury may misjudge and overpraise; but he is entirely right in insisting on its immense importance. More than any modern literature it has been in the most intimate correspondence with the social life and development of the nation producing it. Now it so happens that the great place of France in the world is very much due to her eminent gift for social life and development; and this gift French literature has accompanied, fashioned, perfected, and continues to reflect. This gives a special interest to French literature, and an interest independent even of the excellence of individual French writers, high as that often is. And nowhere shall we find such interest more completely and charmingly brought out than in the *Causeries du Lundi* and the *Nouveaux Lundis* of the consummate critic of whom we have been speaking. As a guide to bring us to a knowledge of the French genius and literature he is unrivalled,—perfect, so far as a poor mortal critic can be perfect, in knowledge of his subject, in judgment, in tact, and tone. Certain spirits are of an excellence almost ideal in certain lines; the human race might willingly adopt them as its spokesmen, recognizing that on these lines their style and utterance may stand as those, not of bounded individuals, but of the human race. So Homer speaks for the human race, and with an excellence which is ideal, in epic narration; Plato in the treatment at once beautiful and profound of philosophical questions; Shakespeare in the presentation of human character; Voltaire in light verse and ironical discussion. A list of perfect ones, indeed, each in his own line! and we may almost venture to add to their number, in his line of literary criticism, Sainte-Beuve. (M. A.)

SAINTE-CLAIRE DEVILLE, ÉTIENNE HENRI (1818-1881), French chemist, was born on 11th March 1818 in the island of St Thomas, West Indies, where his father was French consul. He was educated in Paris along with his elder brother Charles at the Collège Rollin. In 1844, having graduated as doctor of medicine and doctor of science, he was appointed dean of the new faculty of science at Besançon by Thenard. In 1851 he succeeded Balard in the École Normale and in the Sorbonne. He died at Boulogne-sur-Seine on 1st July 1881.

Sainte-Claire Deville began his experimental work in 1841 with investigations on oil of turpentine and balsam of tolu, in the course

of which he discovered the hydro-carbon toluene. But he soon abandoned organic chemistry, and his most important work was in inorganic and thermal chemistry. In 1850 he discovered anhydrous nitric acid, a substance interesting not only in itself but as the first obtained of an important group, the so-called "anhydrides" of the monobasic acids. In 1855 he succeeded in obtaining aluminium in mass. This metal, of which clay is the hydrated silicate, is of course one of the most abundant of metals, but was not obtained in the metallic state until Wöhler in 1827 decomposed its chloride by means of potassium. The aluminium thus prepared was in the form of a fine powder, and, although the isolation of the metal was of great theoretical importance, there did not seem much prospect of a practical application of the discovery. In 1845 Wöhler returned to the subject and by using large quantities of material obtained small globules of an obviously metallic character. Deville, who knew only Wöhler's paper of 1827, set to work to prepare aluminium, not for the sake of the metal itself, but with the view of procuring by the action of aluminium on chloride of aluminium a lower chloride from which a series of new compounds corresponding to the ferrous salts might be obtained. He did not succeed in this, but he did succeed in producing globules of aluminium of considerable size. This led him to perfect the process, and ultimately he devised a method by which aluminium could be prepared on a large scale. The first use to which he put the metal was to make a medal with the name of Wöhler and the date 1827. In connexion with the preparation of aluminium may be mentioned Deville's investigations, partly with Wöhler, into the allotropic forms of silicon and boron.

Along with Debray, Deville studied the platinum metals; their object was on the one hand to prepare the six metals in a state of purity and on the other to obtain a suitable metal for the standard metre. In the course of these investigations large quantities of platinum and of the alloys of platinum and iridium were fused and cast,¹ and the methods used for obtaining the necessary high temperatures were applied to the fusion of other refractory metals, such as cobalt, nickel, chromium, and manganese.

Along with Troost, Deville devised a method for determining the density of vapours at very high temperatures and applied it to the cases of sulphur, selenium, tellurium, zinc, cadmium, and many other substances boiling at temperatures up to 1400° C. The interesting and important results have been already described (see CHEMISTRY and MOLECULE). Deville made a large number of ingenious experiments on the artificial production of minerals. Among these may be specially mentioned the formation of apatite and isomorphous minerals and of crystallized oxides. Deville and Caron found that when the vapour of a metallic fluoride acts on fused boric acid the fluorine and the oxygen change places, a metallic oxide remains in crystals, while the gaseous fluoride of boron escapes. In this way they prepared corundum (crystallized oxide of aluminium) and sapphire, ruby and emerald; coloured forms of corundum were obtained by mixing small quantities of fluoride of chromium with the fluoride of aluminium. Another method discovered by Deville for the preparation of crystallized oxides is of great interest. When an amorphous oxide—such as amorphous ferric oxide—is heated to redness and exposed to a slow current of hydrochloric acid gas, it gradually changes into a crystalline oxide of the same composition. In this way Deville obtained hæmatite, tinstone, periclase, and other crystalline oxides. This conversion of an amorphous into a crystalline substance without change of composition, by the action of a gas (in this case hydrochloric acid) which itself undergoes no change, is one of those mysterious processes which used to be referred to a "catalytic force" or called "actions by contact"; like many such actions, this has been shown by Deville to belong to the same class of phenomena as dissociation.

This leads us to Deville's greatest contribution to general chemistry. Many chemical actions have been long known which take place either in the one or the other sense according to certain conditions. For instance, if a tube containing metallic iron is heated to redness and steam passed through it, water is decomposed, black oxide of iron is formed, and hydrogen escapes. If, on the other hand, the tube is filled with black oxide of iron and hydrogen passed through, the oxide is reduced and water is formed. Both of these opposite changes occur at the very same temperature. Again, a solution of sulph-hydrate of potassium is completely decomposed by passing a current of carbonic acid gas through it for a sufficient time, sulphuretted hydrogen being given off and bicarbonate remaining in solution. But exactly the opposite happens if we begin with bicarbonate and pass sulphuretted hydrogen gas through it: carbonic acid gas escapes and the solution ultimately contains nothing but sulph-hydrate. An imperfect, unsatisfactory explanation of some of the phenomena of which these are examples was given by Berthollet; it remained for Deville to give a general theory and show their relation to such physical phenomena as

evaporation and condensation. This he did by his experimental work on "Dissociation" and his theoretical discussion of the facts in papers published in the *Comptes Rendus*. He gave a very complete and clear account of the whole subject in a lecture delivered before the Chemical Society of Paris in 1866.

As illustrations we shall take a few cases as different from one another as possible.

It has long been known that carbonate of lime—limestone—when heated is decomposed into quicklime and carbonic acid gas, and that this decomposition takes place the more quickly the more thoroughly the carbonic acid produced is removed. Sir James Hall showed that, if the carbonate of lime is heated in a closed vessel strong enough to resist the pressure of the carbonic acid gas, it can be fused, only a small part undergoing decomposition. Deville examined this relation quantitatively and showed that, if in a closed vessel we have quicklime, carbonate of lime, and carbonic acid gas, the pressure of the carbonic acid gas depends on the temperature only, and is quite independent of the quantity of the quicklime or of the carbonate of lime, as long as there is some, however little, of both, and is also quite uninfluenced by the presence of other gases. It will be seen that this case exactly resembles that of the evaporation of water. In a closed vessel containing liquid water and water-vapour the pressure of the water-vapour depends on the temperature only and is independent of the quantity of liquid water, as long as there is any, and is not influenced by the presence of other gases. In both cases, if we disturb the equilibrium and then leave things to themselves the equilibrium is restored. If in the first case we diminish the pressure of the carbonic acid gas, some carbonate of lime decomposes, yielding carbonic acid gas until the pressure is raised to what it was; if we increase the pressure, some of the carbonic acid combines with quicklime until the pressure is reduced to what it was before. In the second case, if we diminish the pressure, some of the liquid water evaporates; if we increase it, some of the water-vapour condenses, and so the pressure is restored. Rise of temperature causes in the one case evaporation of water, in the other decomposition of carbonate of lime,—in both increase of pressure. Lowering of temperature causes in the one case condensation of water-vapour, in the other combination of quicklime and carbonic acid gas,—in both diminution of pressure.

As a second instance we may take the dissociation of water. Just as water-vapour condenses into liquid water under certain conditions, but always with the evolution of heat (latent heat of vapour), so the mixture of oxygen and hydrogen in the proper proportion to form water combines, under certain conditions, to form water-vapour, but always with the evolution of heat (heat of combination). In both cases we have change of state but no change of composition, and in both we have evolution of heat. In the first case we can reverse the process: heat the liquid water, heat becomes latent, liquid water changes into water-vapour. There is a certain definite pressure of water-vapour corresponding to the temperature: raise the temperature, more water evaporates, the pressure of water-vapour increases. It occurred to Deville, to whom both changes were equally physical, that in the second case the process should be reversible also,—that on heating the water-vapour it ought to decompose into oxygen and hydrogen, heat disappearing here also, and that, as there is a definite pressure of water-vapour corresponding to the temperature (often called the tension of water-vapour), so there should be a definite ratio of the pressure of hydrogen and oxygen to that of water-vapour (the tension of dissociation). Deville showed in the most conclusive manner that this is the case and devised ingenious arrangements for proving the actual occurrence of dissociation.

Another case very fully investigated by Deville is that already mentioned,—viz., the action of water-vapour on iron, and of hydrogen on oxide of iron. He showed that, for a fixed temperature, water-vapour and hydrogen are in equilibrium in presence of iron and oxide of iron when the pressures of the two gases, hydrogen and water-vapour, are in a certain ratio quite independent of the quantity of the iron or of the oxide of iron, as long as there is some of each. If the ratio is changed, say by increasing the pressure of the water-vapour, chemical action takes place: water is decomposed, oxide of iron is formed, and hydrogen set free. Again, if the pressure of the water-vapour is diminished, part of the hydrogen acts on oxide of iron, reducing it and forming water. In both cases the ratio of pressures is restored. This gives an easy explanation of the apparently anomalous results mentioned above. When a current of hydrogen is passed over oxide of iron the water-vapour produced is swept away as fast as it is formed; the ratio of the pressure of hydrogen to that of water-vapour is therefore always greater than that required for equilibrium and reduction of iron, and formation of water goes on continuously until all the oxide of iron is reduced. In the same way, a current of water-vapour carries away the hydrogen as fast as it is produced; the ratio of the pressure of hydrogen to that of water-vapour is always less than that required for equilibrium, and the oxidation of iron and production of hydrogen goes on until no metallic iron remains. Exactly the same explanation applies to the action of carbonic acid gas on solution of sulph-

¹ The metre commission fused a quarter of a ton of the alloy at a single operation.

hydrate of potassium, and of sulphuretted hydrogen on solution of bicarbonate of potassium. Equilibrium results when the pressures of the gases are in a certain ratio; if the equilibrium is disturbed chemical action takes place in the direction which tends to restore the equilibrium by reproducing the ratio of pressures.

The apparatus devised by Deville for detecting and measuring dissociation illustrates his remarkable ingenuity. We shall instance only one example in addition to those already mentioned.

One of the great difficulties in observing dissociation depends on its reversible character. A compound may indeed decompose when raised to a high temperature; but, if, as we cool it again, reunion occurs, it is not easy to prove that any chemical change took place. One of the ways in which Deville got over this difficulty was by the use of his "hot and cold tube." Inside a porcelain tube he placed a metal tube of smaller diameter, so that their axes coincided, leaving an annular space between them. This annular space was closed at both ends, but, by means of side tubes near the ends, could be filled with any gas, or a current of gas could be passed through it. The porcelain tube was raised to a high temperature by being placed in a furnace, while the internal metal tube was kept cold by running water through it. By this means he proved the dissociation of carbonic acid gas, carbonic oxide, and sulphurous acid gas,—the carbon or sulphur being deposited on the outer wall of the cold internal tube, and thus kept at a temperature below that at which recombination could take place.

Deville's observations on dissociation and his generalizations from them have a very direct bearing on the kinetic theory of gases, and it is a fact of interest in the history of science that Deville did not recognize the validity of that theory. Our estimate of the ingenuity, skill, and patience shown in his experimental work, and of the genius and sound judgment which directed his theoretical conclusions, is perhaps raised when we recollect that he was neither led in the first nor biased in the second by ideas derived from the kinetic theory, and his hostile or at least neutral attitude towards it gives perhaps greater value to the evidence that his work has contributed to its soundness.

Deville's works were published in the *Annales de Chimie et de Physique* and in the *Comptes Rendus*. He further published a volume, entitled *De l'Aluminium; ses Propriétés, &c.*, Paris, 1859, and the lecture *On Dissociation* already referred to. (A. C. B.)

STE MARIE-AUX-MINES. See MARKIRCH.

SAINTES, a town of France, the chef-lieu of an arrondissement in the department of Charente-Inférieure, on the left bank of the Charente, 88 feet above the sea and 45 miles south-east of La Rochelle by the railway from Nantes to Bordeaux. It occupies a delightful position and is of interest for its Roman remains. Of these the best preserved is the triumphal arch of Germanicus, although it has been removed and rebuilt stone by stone. The amphitheatre is larger than those of Nîmes, Bordeaux, and Pompeii, and in area (.89 of an acre) is surpassed only by the Colosseum. The external ellipse was 436 feet long and 354 broad. Rubble embedded in cement is the material of the building, which dates probably from the close of the 1st or the beginning of the 2d century. Measures have been taken to keep the ruins, now made picturesque by trees, from further injury or decay. The capitol was destroyed after the capture of the town from the English by Charles of Alençon, brother of Philip of Valois, in 1330. An ancient hypogæum is still preserved, as well as numerous traces of the channels by which water was conveyed to private houses. The antiquarian museum contains 7000 medals and numerous sculptured pieces. Saintes was a bishop's see till 1790; the cathedral of St Peter, rebuilt at the close of the 12th century, was almost destroyed by the Huguenots in 1568. As rebuilt between 1582 and 1585 the interior of the church has an unattractive appearance. The tower is 236 feet high. The church of St Eutropius (which was founded in the close of the 6th century, rebuilt in the 11th, and had its nave destroyed in the Wars of Religion) stands above a very interesting well-lighted crypt, the largest in France after that of Chartres, adorned with richly sculptured capitals and containing the tomb of St Eutropius (4th or 5th century). Notre Dame, a splendid example of the architecture of the 11th and 12th centuries, with a noble round clock-tower, is unfortunately occupied by the military authorities, who have divided and mutilated the interior. The town, which was

at one time at the head of the department, is still the seat of the courts of assize and has a court-house. Other public buildings are a town-house (Renaissance), a hospital, and a library. Small vessels ascend the river as far as Saintes, which has an advantageous situation between Angoulême and Cognac higher up and Taillebourg and Rochefort farther down, and is the seat of iron and copper foundries, factories for agricultural instruments, cooperages, and skin-dressing establishments. The population in 1881 was 13,341 (15,763 in the commune).

Saintes (Mediolanum or Mediolanum), the capital of the Santones, was a flourishing town before Cæsar's conquest of Gaul. Christianity was introduced by St Eutropius, its first bishop, in the middle of the 3d century. Charlemagne rebuilt its cathedral. The Normans burned the town in 845 and 854. Richard Cœur de Lion fortified himself within its walls against his father Henry II., who captured it after a destructive siege. It was not till the reign of Charles V. that Saintes was permanently recovered from the English. The Protestants did great damage during the Wars of Religion.

ST ÉTIENNE, an industrial and manufacturing town of France, chef-lieu of the department of Loire, 312 miles south-south-east of Paris and 36 miles south-south-west of Lyons by rail, with a branch line to Le Puy. The coal-field of St Étienne is the richest in France after that of Valenciennes and Pas de Calais, giving employment to 12,000 miners and 5000 workmen at the pit-heads. There are 64 concessions worked by 28 companies, extending over an area 20 miles long by 5 in width; the mineral is of two kinds,—smelting coal (said to be the best in France) and gas coal; the yearly output is between 3,000,000 and 4,000,000 tons, but with a tendency to decrease. In the metallurgic establishments of the arrondissement, which extend all the way along the railway from Firminy to Rive-de-Gier, 5540 workmen are employed, and in 1882 61,127 tons of cast metal, 58,445 tons of iron, 10,815 tons of sheet-iron, and 131,563 tons of steel of all kinds were manufactured. The last-named industry, carried on according to the Bessemer and Martin processes, yields nearly a third of the whole French production of steel. Military and naval material, railway plant, and articles of general merchandise are all made at St Étienne, and its name is especially associated with large castings, bomb-proof plates, ship-armour, masts, and pieces of machinery. The national gun-factory, under the direction of artillery officers and employing 4300 workmen, is almost exclusively devoted to the production of rifles and revolvers for the army. A certain number of gun-makers not engaged in the factory turn out from 80,000 to 90,000 firearms (hunting-pieces, revolvers, &c.) per annum. Hardware is manufactured by 60 firms, employing 7000 workmen (who are not, however, exclusively occupied with this department); leading articles are locks (known as Forez locks), common cutlery, files, nails, bolts, anvils, vices. Hemp cables for mines,

Plan of St Étienne.

hats, pottery, and lime are among the miscellaneous manufactured products of the town, which is besides a great centre of the ribbon trade, with a testing-house (*condition*) for examining the silk. From 500 to 600 tons of silk, valued at £1,200,000 to £1,400,000, are used per annum, and the manufactured articles reach a value ranging from £2,800,000 to £3,200,000. The ribbons, laces, trimmings (in silk, cotton, and india-rubber) produced in the arrondissement of St Étienne are valued at £4,000,000, and form four-fifths of the total French production. With the exception of a few factories where machinery is employed, the whole manufacture is carried on by persons with small means. About 5000 looms (Jacquard's permitting thirty-six pieces to be woven at once) and 40,000 workmen are employed. Besides the old abbey church of Valbenoîte (outside of the town) with its nave dating from the 13th century, the public buildings comprise a Protestant church, a synagogue, a town-house (finished under the second empire and decorated with statues of the ribbon trade and metallurgy), a school of mines (1816), with a mineralogical and geological collection, and a "palace of the arts," with a museum and library rich in old MSS. and collections in connexion with artillery and natural history. Near Valbenoîte in the wooded gorge of the Furens is the reservoir of Gouffre d'Enfer, formed by a dam (1861-1866) 328 feet long, 131 high, and 131 wide at the base, and capable of storing about 70,000,000 cubic feet of water. The population of the town was 28,000 in 1764; by 1876 it was 126,019, but it had decreased to 114,962 (123,813 in the commune) in 1881.

At the close of the 12th century St Étienne was only a parish of the Pays de Gier belonging to the abbey of Valbenoîte. By the middle of the 14th century the coal trade had reached a certain development, and by the close of the century the town was surrounded with walls and had consuls. A hundred years later it had three growing suburbs. The Wars of Religion stimulated the manufacture of arms, and about the same period the ribbon trade sprang into existence. It was not till the 18th century, however, that the town entered on its era of prosperity. The royal manufactory of arms was established in 1764. In 1789 they were producing at the rate of 12,000 muskets per annum; between September 1794 and May 1796 they delivered 170,858; and 100,000 was the annual average throughout the whole period of the empire. The first railways opened in France were the line between St Étienne and Andrieux on the Loire in 1828 and that between St Étienne and Lyons in 1831. In 1856 St Étienne became the administrative centre of the department instead of Montbrison. Among the local celebrities are Francis Garnier, who conquered Tongking in 1873, and several engravers who have given eminence to the St Étienne school of engraving.

ST EUSTATIUS, or ST EUSTACHE, one of the Dutch West India Islands, a dependency of Curaçao, lying north-west of St Kitts in 17° 50' N. lat. and 62° 40' W. long., consists of two volcanic cones and an intervening valley, and contains the small town of Orangetown and two forts. The population, which from 7600 in 1786 had decreased to 1741 (about 1000 Negroes), was again 2247 in 1882. Between 300 and 400 vessels visit the island annually. Yams and sweet potatoes are exported (5187 and 3010 tons in 1882). The Dutch occupied St Eustatius in 1635, and, after frequent French and English interruptions, were confirmed in their possession of it in 1814.

SAINT-ÉVREMOND, CHARLES DE MARGUETEL DE SAINT-DENIS, SEIGNEUR DE (1613-1703), was born at Saint-Denis-le-Guast near Coutances, the seat of his family in Normandy, on 1st April 1613. He was a younger son, but took his designation from one of the smaller estates of the family and appears to have had a sufficient portion. He was a pupil of the Jesuits at the Collège de Clermont, Paris, then a student at Caen. For a time he followed the law at the Collège d'Harcourt. He soon, however, took to arms and in 1629 went with Bassompierre to Italy. He served through great part of the Thirty Years' War, chiefly in Germany, and, meeting Gassendi at Paris, became

strongly imbued with his doctrines. He was present at Rocroy, at Nördlingen, and at Lens. For a time he was attached to Condé, but is said to have offended him by some satirical speech or speeches. During the Fronde, Saint-Évremond, unlike most of his contemporaries, never changed sides, but was a steady royalist. The duke of Candale (of whom he has left a very severe portrait) gave him some appointments in Guienne, and Saint-Évremond is said to have saved 50,000 livres in less than three years. He was one of the numerous victims of the fate of Fouquet. His letter to Créqui on the peace of the Pyrenees, which is said to have been discovered by Colbert's agents at the seizure of the superintendent's papers, seems a very inadequate cause for exile, and it has been supposed that there was more behind; but nothing is known certainly. Saint-Évremond went to Holland and England, where he was received with open arms by Charles II., and was pensioned. He found himself very much at home in England, and though after James II.'s flight to France Saint-Évremond was invited to return he declined. Hortense Mancini, the most attractive of Mazarin's strangely attractive group of nieces, came to England and set up a *salon* for love-making, gambling, and witty conversation, and here Saint-Évremond was for many years at home. He died on Michaelmas Day 1703, and was buried in Westminster Abbey, where his monument still is in Poet's Corner close to that of Prior.

Saint-Évremond is perhaps the most remarkable instance of the curious 17th-century fancy for circulating literary work in manuscript or clandestinely. He never himself authorized the printing of any of his works during his long lifetime, though Barbin in 1668 published an unauthorized collection. But he empowered Des Maizeaux to publish his works after his death, and they duly appeared, the earliest form and date being 3 vols. 4to, 1705. They were often reprinted in various forms during the first half of the 18th century. Saint-Évremond, however, had made his mark and established his influence long before the earliest of these books appeared. He was an older man than Pascal, a very much older man than Anthony Hamilton, and he probably preceded the first, as he certainly long preceded the second, in the employment for literary purposes of a singularly light, polished, and graceful irony, which taught a great deal to Voltaire, but which Voltaire was never able to imitate with quite the air of good company which distinguishes his teacher. The masterpiece of Saint-Évremond's style in this respect is the so-called *Conversation du Maréchal d'Hocquincourt avec le Père Canaye* (the latter a Jesuit and Saint-Évremond's master at school), which has been frequently classed with the *Lettres Provinciales*, but which with less of moral purpose and of cutting reproof even excels those famous compositions in dramatic power and in subtle good-humoured irony. The remainder of Saint-Évremond's works are desultory in the extreme. Some elaborate letters contain the exposition of an Epicurean philosophy of life which had a very great influence on the polite society of his day. Others, and the most important of all, exhibit the writer as a literary critic of singular discrimination and taste. His comparisons of Corneille and Racine, his remarks on English drama (chiefly that of Ben Jonson), his sketches of criticism on Roman character and literature, all show a remarkable union of acute and orderly generalization with freedom from the merely academic spirit which had in his time already begun to beset France. Altogether, Saint-Évremond may be said with greater right to deserve the phrase which used to be applied to Sir William Temple. He is the first master of the genteel style in French literature, and the lively poignancy of his irony prevents this gentility from ever becoming insipid. His influence indeed was hardly less in his adopted than in his native country, and it may be traced in the Queen Anne essayists to a not much less degree than in Hamilton and Voltaire.

Saint-Évremond's complete works have not recently been reprinted, but there are selections by Hippeau, Giraud, and others.

ST GALL, in area the sixth (789 square miles), in actual population the fourth (210,491), and in relative density of population the tenth of the Swiss cantons, was formed in 1803 out of the two independent communities of the "town" and the "abbey" (including Toggenburg), Rapperswyl, Uznach, Gaster, Sargans, Gams, Rheintal, Sax (with Forsteck), which belonged to Zurich, and Werdenberg, which belonged to Glarus. It encloses the canton

of Appenzell, extending between the Lake of Constance and the Lake of Zurich on the west, and being bounded by the Rhine on the east, while in the south-west lies the valley occupied by the Wallenstätt Lake and the Linth Canal. The Rhine separates St Gall from Tyrol, and the rest of its frontier is conterminous in succession with Grisons, Glarus, Schwyz, Zurich, and Thurgau. In altitude the canton ranges from 1306 feet above the sea (the height of the Lake of Constance) to 10,660 feet in the Ringelspitz of the Sardona group. The arable area is not sufficient to supply the local demand for grain; but the stock-breeding and especially the manufacturing industries, to which a large part of the population is devoted, make up for any agricultural deficiency. Rorschach and Rapperswyl are lake ports; Wyl, Lichtensteig, Altstätten, and Uznach markets of some importance for local products. Ironstone is worked in the Gonzen district, and there are quarries at Rorschach and Bolligen, Mels and Degersheim. Ragatz, the well-known watering-place, is supplied with mineral water from Pfäfers. The people of St Gall are three-fifths Roman Catholic and two-fifths Protestant (126,164 and 83,441 in 1880), but, in spite of this and considerable diversities of culture and character from district to district, a fair degree of harmony has ultimately been secured even in the treatment of educational questions. The constitution dates from 1861 and was partially revised in 1875. After being abolished for many years, the death-penalty was re-enacted in 1882. Besides the city of St Gall there were in the canton in 1880 three communes with upwards of 5000 inhabitants each,—Tablat (8092), Wattwyl (a seat of the cotton manufacture, 5283), and Straubenzell (5026).

ST GALL (German *Sankt Gallen*), capital of the above canton, occupies along with its suburbs St Fiden, Neudorf, and Langgasse (to the east), and Lachen and Vonwil (to the west), an area 4 miles long by 1 broad in the highland valley of the Steinach, which descends north-east to the Lake of Constance. On a pillar in the market-place are the following details:—Lat. 47° 25' 36" N.; long. 7° 2' 27" E. from Paris (9° 22' 41" Green.); height above the sea, 2196·6 feet; mean annual temperature, 45·6; annual rainfall, 50 inches; air-distance from Zurich 39 miles, from Geneva 174. The only town—not village—in Europe which has a higher position than St Gall is Madrid. The chief building in St Gall is the abbey, of which (as it was originally arranged) a ground plan and description are given in vol. i. pp. 12, 13. The abbey church, since 1846 the Roman Catholic cathedral, was entirely rebuilt in the latter part of the 18th century in the rococo style. Partly from the desire to include within the choir the tombs of the two founders and partly from the hostility which long existed between town and tonsure, both the towers (217 feet) are placed at the east end and the main entrance is in the north side. The whole church has a length of 400 feet (with the sacristy 454 feet), and a breadth in the nave of 95 feet, a disproportion which is considerably disguised by the arrangement of the interior. Among the internal decorations are two colossal statues of St Desiderius and St Mauritius, the original patrons of the church, whose relics were brought from Scotland. Other buildings of importance are the (Protestant) church of St Lawrence, partially rebuilt (1851-53) according to plans by the Swiss poet Johann G. Müller, the Government offices on the east side of the abbey-court (where Schöll's famous relief of the cantons of St Gall and Appenzell is to be seen), the town-house, the offices of the Mercantile Directorium (a 17th-century institution to which the town owes much of its commercial prosperity), the great cantonal school—comprising a gymnasium, a technical school (preparatory to the polytechnicum at Zurich), and a mercantile

school—the cantonal reformatory of St Jacob, the hospitals, and the infantry and cavalry barracks. In the town park, part of which is occupied by the botanic gardens, stands the public museum, containing natural history collections, the industrial collections and industrial drawing-school of the Mercantile Directorium, the picture gallery of the Art Society, and the antiquarian collections of the Historical Society. The museum of the East Swiss Geographical Commercial Society is located in the cantonal school. Besides the abbey library, famous for its ancient MSS. (original of the *Nibelungenlied*, &c.), there is a town library (*Bibliotheca Vadiana*), founded by the reformer Joachim de Watt or Vadianus. In spite of its position and climate, St Gall is the seat of extensive industries and trades. About 45,000 persons in the surrounding cantons are engaged in the manufacture of embroidered goods, mainly muslins, for the St Gall capitalists, who also employ some 6000 or 7000 women in chain-stitch and hand embroidery. In 1872 6384 machines were at work in this department in the town and vicinity, and in 1882 14,883. The value of textile fabrics and embroidered goods annually exported from St Gall is £3,600,000 to £4,000,000. All round the town the meadows are used as bleaching-grounds for the webs. In 1870 the population was 16,675, in 1880 21,438.

The abbey of St Gall was named after its founder, a follower of St Columba, who along with Columban left Ireland on the destruction of Bangor and finally settled down in the midst of the great forest which then stretched from the Lake of Constance to the Säntis Mountains, for the purpose of converting the Alemanni. On his death on 16th October 625 this apostle of Celtic Christianity was buried in his oratory, and in the 9th century the spot thus consecrated became the site of the monastic buildings erected by Abbots Gozbert and Grimoald. The foundation was already a wealthy one, and it soon became a great centre of literary and artistic culture, attracting numerous pupils and receiving the homage of dukes and emperors. In the 10th century the abbey and its cluster of houses were surrounded with a wall, which in 954 had to defend the settlement against an attack by a band of Saracens. In the reign of Rudolph of Hapsburg the town obtained a recognition of its communal independence from Abbot Ulrich and from the emperor himself a variety of important privileges. An alliance defensive and offensive was formed in 1312 with Zurich, Constance, and Schaffhausen; and, although the prosperity of the town received a severe check by a great conflagration in 1314, the vigour with which the burghers prosecuted the newly introduced linen manufacture soon made it one of the most flourishing towns of Switzerland. About the middle of the 14th century the burghers began to share in the government of the town; and in 1457 they bought up all the claims of the abbots to territorial jurisdiction. In 1454 St Gall joined the confederation of the Swiss towns, Zurich, &c. Abbot Ulrich VIII. determined to remove the abbey to Rorschach; but the inhabitants of St Gall, Appenzell, &c., combined to destroy his new buildings, and, though St Gall was besieged by the abbot's supporters and had to pay grievous damages (1490), the treaty which it signed bound the abbots never to attempt to remove the relics of the founder. The abbey, which had purchased the countship of Toggenburg, passed at the Reformation into the hands of the town (1529), but it was restored to the abbots in 1530; and, when in 1712 in the "Toggenburg War" Zurich and Bern devastated the abbey and its possessions, the townsfolk remained neutral. The final dissolution of the abbey occurred in 1798. Under the French, St Gall was the chief town of the canton of Säntis.

SAINT-GERMAIN, COMTE DE (d. 1730), a celebrated adventurer of the 18th century who by the assertion of his discovery of some extraordinary secrets of nature exercised considerable influence at several European courts. Of his parentage and place of birth nothing is definitely known; the common version is that he was a Portuguese Jew. It was also commonly stated that he obtained his money from discharging the functions of spy to one of the European courts. He knew nearly all the European languages, spoke good German and English, excellent Italian, French (with a Piedmontese accent), and Portuguese and Spanish with perfect purity. Grimm affirms him to have been the man of the best parts he had ever known. His knowledge of history was comprehensive and minute, and his accom-

plishments as a chemist, on which he based his reputation, were undoubtedly real and considerable. The most remarkable of his professed discoveries was of a liquid which could prolong life, and by which he asserted he had lived 2000 years. At the court of Louis XV., where he appeared about 1748, he exercised for a time extraordinary influence, but, having interfered in the dispute between the houses of Austria and France, he was compelled in June 1760, on account of the hostility of the duke of Choiseul, to remove to England. He appears to have resided in London for one or two years, but was at St Petersburg in 1762, and is asserted to have played an important part in connexion with the conspiracy against the emperor Peter III. in July of that year. He then went to Germany, where, according to the *Mémoires authentiques* of Cagliostro, he was the founder of freemasonry, and initiated Cagliostro into that rite. After frequenting several of the German courts he finally took up his residence in Schleswig-Holstein, where he and the landgrave Charles of Hesse pursued together the study of the "secret" sciences. He died at Schleswig in 1780.

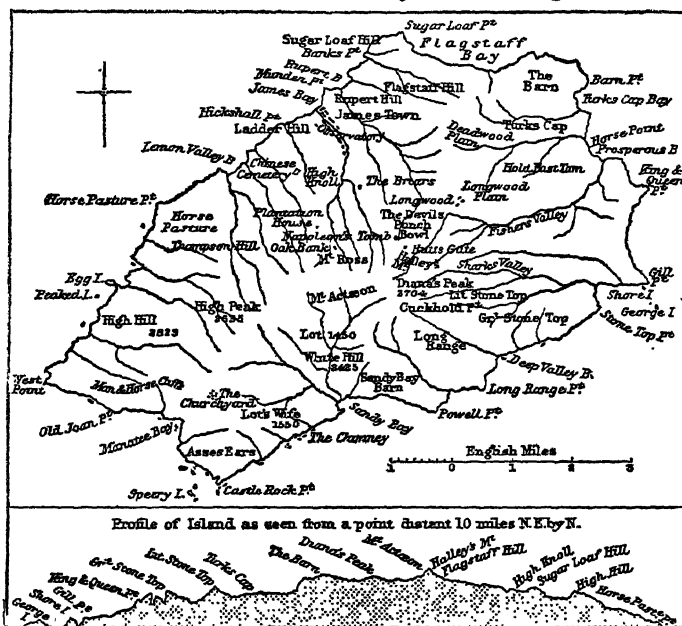

Saint-Germain figures prominently in the correspondence of Grimm and of Voltaire. See also Oettinger, *Graf Saint-Germain*, 1846; Büllau, *Geheime Geschichten und räthselhafte Menschen*, vol. i. cap. xiii.

ST GERMAIN-EN-LAYE, a town of France, in the department of Seine-et-Oise, 8 miles north of Versailles and 13 west of Paris by rail. Built on a hill on the left bank of the Seine, nearly 200 feet above the river, and on the edge of a forest 10,000 to 11,000 acres in extent, St Germain has a healthy and bracing air, which makes it a favourite place of summer residence with the Parisians. It had 15,545 inhabitants in 1881 (15,790 in the commune). The terrace of St Germain, constructed by Lenôtre in 1672, is 7900 feet long and 100 feet wide, is planted with lime trees upwards of a hundred years old, and affords an extensive view over the valley of the Seine as far as Paris and the surrounding hills; hence it ranks as one of the finest promenades in Europe. It was also after Lenôtre's plans that the "parterre" promenade was laid out between the castle and the forest and the "English garden" (by which it is approached). The history of St Germain centres in the castle, now occupied by a museum of national antiquities.

A monastery in honour of St Germain, bishop of Paris, was built in the forest of Laye by King Robert. Louis VI. erected a castle close by. Burned by the English, rebuilt by Louis IX., and again by Charles V., this castle did not reach its full development till the time of Francis I., who may be almost regarded as the real founder of the building. A new castle was erected by Henry II.; but it was demolished by the count of Artois, and there remains only the so-called Henry IV. pavilion, now used as an hotel, and known as the place where Thiers died, 3d September 1877. The old castle, on the contrary, is being completely restored to the state in which it was under Francis I. The chapel, dating from 1240, is older than the Sainte Chapelle at Paris, and is worthy of note for its rose and other windows. The museum, which will occupy forty rooms, contains a chronological series of artistic and industrial products from the earliest prehistoric times. In the church of St Germain is a mausoleum erected by Queen Victoria to the memory of James II. of England, who found in the old castle (now demolished) an asylum after the Revolution of 1688. In one of the public squares is a statue of Thiers. The town is the seat of one of the cavalry garrisons which surround Paris. At no great distance in the forest is the Convent des Loges, a branch of the educational establishment of the Legion of Honour (St Denis). The fête des Loges is one of the most popular in the neighbourhood of Paris. Henry II., Charles IX., and Margaret of Navarre were born at St Germain, as well as Louis XIV., who is said to have removed from this place to Versailles to get away from the sight of the clock-tower of St Denis, the church where he was to be buried.

ST HELENA, an island in the Atlantic in $15^{\circ} 55' 26''$ S. lat. and $5^{\circ} 42' 30''$ W. long. (Ladder Hill Observatory), lies 1140 miles from Africa, 1800 from America, 700 south-east of the island of Ascension (the nearest land), and 4000 from Great Britain, of which it has been

a dependency since 1651. The area is about 45 square miles, the extreme length from south-west to north-east being $10\frac{1}{4}$ miles and the extreme breadth $8\frac{1}{4}$. The island is a very ancient volcano, greatly changed by oceanic abrasion and atmospheric denudation. The northern rim of the great crater still forms the principal ridge, with the culminating summits of Diana's Peak (2704 feet) and High Peak (2635); the southern rim has been altogether washed away, though its débris apparently keeps the sea shallow (from 20 to 50 fathoms) for some 2 miles south-east of Sandy Bay, which hypothetically forms the centre of the ring. From the crater wall outwards water-cut gorges stretch in all directions, widening as they approach the sea into valleys, some of which are 1000 feet deep, and measure one-eighth of a mile across at bottom and three-eighths across the top (Melliss). Along the enclosing hill-sides caves have been formed by the washing out of the

Map of St Helena.

softer rocks. High Hill (2823 feet) and High Knoll (1903) are lateral cones. Many dykes and masses of basaltic rock seem to have been injected "subsequently to the last volcanic eruptions from the central crater." Among the more remarkable instances are the Ass's Ears and Lot's Wife, picturesque pinnacles standing out on the south-east part of the crater ridge, and the Chimney on the coast to the south of Sandy Bay. In the neighbourhood of Man and Horse (south-west corner of the island), throughout an area of about 40 acres, scarcely 50 square yards exist not crossed by a dyke. On the leeward side of St Helena the sea-face is generally formed by cliffs from 600 to 1000 feet high, and on the windward side these heights often increase to full 2000 feet, as at Holdfast Tom, Stone Top, and Old Joan Point. Limited deposits of calcareous sandstones and stalagmitic limestones occur at certain points, as on Sugar-Loaf Hill; they probably consist of particles of shells blown by the wind from some primeval beach, long since destroyed.

As regards its vegetation, St Helena is divided into three zones, —(1) the coast zone, extending inland for a mile to a mile and a half, formerly clothed with a luxuriant vegetation, but now "dry, barren, soilless, lichen-coated, and rocky," with little save prickly pears, wire grass, and *Mesembryanthemum*; (2) the middle zone (400-1800 feet), extending about three-quarters of a mile inland, not so rocky, with shallower valleys and grassier slopes, —the English broom and gorse, brambles, willows, poplars, Scotch pines, &c., being the prevailing forms; and (3) the central zone, about 3 miles long and 2 wide, the last refuge for the most part of that marvellous

flora which has been for generations the admiration and sorrow of the botanist. According to Mr W. B. Helmsley (who has summarized all that is known on the matter in his report on the botany of the Atlantic Islands),¹ the certainly indigenous species of plants are 65, the probably indigenous 24, and the doubtfully indigenous 5; total 94. Of the 38 flowering plants 20 are shrubs or small trees. With the exception of *Scirpus nodosus*, all the 38 are peculiar to the island; and the same is true of 12 of the 27 vascular cryptogams (a remarkable proportion). Since the flora began to be studied, two species—*Melhania melanoxylon* and *Acca ypha rubra*—are known to have become extinct; and at least two others have probably shared the same fate—*Heliotropium pennifolium* and *Demazeria obliterata*. *Melhania melanoxylon*, or "native ebony," once abounded in parts of the island now barren; but the local legislation decided that goats were of more value than ebony. Its beautiful congener *Melhania erythroxylon* ("red-wood") was still tolerably plentiful in 1810, but is now reduced to a few specimens. Very rare, too, has become *Pelargonium cotyledonis*, called "Old Father Live-for-ever," from its retaining vitality for months without soil or water. *Commidendron robustum* ("gumwood"), a tree about 20 feet high, once the most abundant in the island, was represented in 1868 by about 1300 or 1400 examples; and *Commidendron rugosum* ("scrubwood") is confined to somewhat limited regions. Both these plants are characterized by a daisy- or aster-like blossom, which looks very strange on a tree. In general the affinities of the indigenous flora of St Helena were described by Sir Joseph Hooker as African, but Mr Bentham points out that the important element of the *Compositæ* shows, at least in its older forms, a connexion rather with South America. The exotic flora introduced from all parts of the world gives the island almost the aspect of a botanic garden. The oak, thoroughly naturalized, grows alongside of the bamboo and banana. As contributing largely to the general physiognomy of the vegetation must be mentioned—the common English gorse; *Rubus pinnatus*, probably introduced from Africa about 1775; *Hypochaeris radicata*, which above 1500 feet forms the dandelion of the country; the beautiful but aggressive *Buddleia madagascariensis*; *Physalis peruviana*; the common castor-oil plant; and the pride of India. The peepul is the principal shade tree in Jamestown, and in Jamestown valley the date-palm grows freely. Orange and lemon trees, once common, are now scarce. The attempt (1869-71) to introduce cinchona cultivation failed. Potatoes are probably the staple production of the St Helena farmers, and as many as three crops per annum are sometimes obtained.

The fauna of St Helena is only second in interest to its flora. Besides domestic animals the only land mammals are rabbits, rats, and mice, the rats being especially abundant and building their nests in the highest trees. Probably the only endemic land bird is the wire bird, *Agialitis sanctæ helenæ*; the averdevat, Java sparrow, cardinal, ground-dove, partridge (possibly the Indian *chukar*), pheasant, and guinea-fowl are all common. The pea-fowl, at one time not uncommon in a wild state, is long since exterminated. Though fresh water abounds in the island in the form of springs, rivulets, and streams, there are no freshwater fish, beetles, or shells. Of sixty-five species of sea-fish caught off the island seventeen are peculiar to St Helena; economically the more important kinds are gurnard, eel, cod, mackerel, tunny, bullseye, cavalley, flounder, hog-fish, mullet, and skulpin. Mr Wollaston, in *Coleoptera Sanctæ Helenæ*, 1877, shows that out of a total list of 203 species of beetles 129 are probably aboriginal and 128 peculiar to the island, —an individuality perhaps unequalled in the world. More than two-thirds are weevils and a vast majority wood-borers, a fact which bears out the tradition of forests having once covered the island. The *Hemiptera* and the land-shells also show a strong residuum of peculiar genera and species. A South-American white ant (*Termes tenuis*, Hagen.), introduced from a slave-ship in 1840, soon became a real plague at Jamestown, where a considerable portion of the public library fell a prey to its voracity. The honey-bee, which thrived for some time after its introduction, again died out. (Comp. Wallace, *Island Life*.)

The population of St Helena was 6444 in 1871 and 5059 (2617 males, 2442 females) in 1881; it consists of Government officials, of old-established residents ("yamstalks") of somewhat composite origin, European and Asiatic, and of the descendants of Negroes landed from the West African slave-ships subsequent to 1840. The only town—Jamestown (3000 inhabitants)—lies in a deep valley on the north-west coast, and there is a village in the neighbouring Rupert's Valley. Ladder Hill, the seat of the garrison, is so called from the almost precipitous ladder-like wooden stair by which its height of 600 feet can be scaled. Longwood, where Napoleon died in 1821, is a farmhouse in an elevated plain (2000 feet high), about 3½ miles inland from Jamestown.

St Helena was discovered by the Portuguese navigator João da Nova on the 21st of May 1501. The island received its first known inhabitant in 1513 in the person of Fernandez Lopez, a

Portuguese of good family, who preferred being marooned to returning to Europe after the barbarous mutilation to which he had been subjected for some misdemeanour. Cavendish (1588), Kendall (1591), and Lancaster (1598) were the earliest English visitors. The Dutch, who had for some time been in possession of the island, withdrew in 1651, but on two occasions (1665 and 1673) managed to expel the forces of the English East India Company, which had at once seized the abandoned prize. The company, having procured a second charter of possession on 16th December 1673, remained the governing authority till 22d April 1834, when St Helena passed into the hands of the British crown. In 1832 it had purchased the freedom of the slaves (614) for £28,062. As a port of call the island continued to prosper till the opening of the Suez Canal, which, by altering the route to the East Indies, deprived the people of their means of subsistence. The revenue has decreased from £13,931 in 1874 to £10,421 in 1884, the expenditure from £14,521 to £10,806, the value of imports from £53,874 to £41,816, and of exports from £4006 to £1436. Halley the astronomer in 1676 left his name to Halley's Mount; and Maskelyne and Waddington visited the island in 1761.

See Seale, *Geognosy of Saint Helena* (folio plates), 1834; Brooke, *History of Saint Helena*, 1808 and 1824; Beatson, *Tracts*, &c., 1816; Darwin, *Geological Observations on Volcanic Islands*, 1844; Melliss, *Saint Helena*, 1876.

ST HELEN'S, a market-town and municipal and parliamentary borough of south-west Lancashire, England, is situated on a branch of the London and North-Western Railway, 21 miles west by south of Manchester and 10 east-north-east of Liverpool. It is the principal seat in England for the manufacture of crown, plate, and sheet glass, and has extensive copper smelting and refining works, as well as chemical works, iron and brass foundries, and potteries. There are collieries in the neighbourhood. The town, which is entirely of modern origin, obtained a charter of incorporation in 1868. A town-hall was erected in 1873, and there are also a public library and various institutes for affording instruction and amusement to the working-class population. Extensive drainage works have been carried out under a local Act. The corporation are the owners of the waterworks and gasworks. Enfranchised in 1885, St Helen's returns one member to the House of Commons. The population of the borough (area, 6586 acres) in 1871 was 45,134, and in 1881 it was 57,403.

ST HELIER. See JERSEY, vol. xiii. p. 635.

SAINT-HILAIRE. See GEOFFROY SAINT-HILAIRE.

SAINT-HILAIRE, AUGUSTE DE (1799-1853), French botanist and traveller, was born at Orleans on 4th October 1799. He began to publish memoirs on botanical subjects at an early age. In 1816-22 and in 1830 he travelled in South America, especially in south and central Brazil, and the results of his personal study of the rich flora of the regions through which he passed appeared in several books and numerous articles in scientific journals. These works are most valuable from the copious information they afford not only about the plants and other natural products but also about the native races he encountered. Those by which he is best known are the *Flora Brasiliæ Meridionalis* (3 vols. folio, with 192 coloured plates, 1825-32), published in conjunction with A. de Jussieu and Cambessède, *Histoire des plantes les plus remarquables du Brésil et de Paraguay* (1 vol. 4to, 30 plates, 1824), *Plantes usuelles des Brésiliens* (1 vol. 4to, 70 plates, 1827-28), also in conjunction with De Jussieu and Cambessède, *Voyage dans le district des Diamants et sur le littoral du Brésil* (2 vols. 8vo, 1833). His numerous articles in journals deal largely with the plants of Brazil and the general characters of its vegetation; but Saint-Hilaire also aided much in establishing the natural system of classification on the firm basis of structural characters in the flowers and fruits; and that he recognized the importance of the study of anomalies in this view is shown in more than one of his writings. His *Leçons de Botanique, comprenant principalement la Morphologie Végétale*, published in 1840, is a very comprehensive and clear exposition of botanical morphology up to 1840 and of its application to systematic botany. He died at Orleans on 30th September 1853.

¹ *Voyage of H.M.S. Challenger, Botany*, vol. 1.

ST IVES, a seaport and borough of west Cornwall, England, is situated at the west entrance of the beautiful St Ives Bay on the Bristol Channel, 7 miles north of Penzance. The older streets are narrow and irregular, but on the slopes above there are modern terraces with good houses. The town takes its name from St Hya or Ia, an Irish virgin who is said to have arrived in the bay in the 5th century. The parish church of St Andrew is in the Early Perpendicular style of the 15th century. In the churchyard is an ancient cross recently restored. A town-hall was erected in 1832. The town is the headquarters of the pilchard fishery. The port has suffered greatly from the accumulation of sand. A stone pier was built by Smeaton in 1767; a breakwater was commenced in 1816 but abandoned; and a wooden pier, which was commenced in 1865, is still unfinished. Formerly the town was called Pendenis or Pendunes. Its charter of incorporation, granted by Charles I. in 1639, was forfeited in 1685, but was renewed by James II. in 1686. From the reign of John until 1832 it sent two members to parliament, and one from 1832 until 1885, when it was merged in the St Ives division of the county. The population of the municipal borough (area, 1890 acres) in 1871 was 6965, and in 1881 it was 6445.

ST JEAN BAPTISTE, a suburb of Montreal, Canada, under a separate municipality. It lies north-north-east of Mount Royal Park and is hardly a mile from the centre of the city. The population in 1881 was 5874.

ST JEAN D'ACRE. See ACRE.

ST JEAN D'ANGÉLY, a town of France, the chef-lieu of an arrondissement in the department of Charente-Inférieure, on the right bank of the Boutonne (a right-hand affluent of the Charente) and on the railway from Taillebourg (12 miles south-west) to Niort (30 miles north). The town, which is badly planned and built, contains the remains of a Benedictine abbey, destroyed in 1568; the existing church corresponds to but a part of the large old abbey church erected in the 13th century. The harbour admits vessels of 30 to 40 tons burden, and wine and brandy are exported. The population was 6538 in 1881 (7279 in the commune).

St Jean owes its origin to a castle of the 7th century, which the dukes of Aquitaine used as a lodge for boar-hunting in the neighbouring forest of Anger. Pippin, son of Louis le Debonnaire, turned it into a monastery, where he deposited the head of John Baptist. This relic attracted hosts of pilgrims; a town grew up, took the name St Jean d'Anger, afterwards d'Angély, was fortified in 1131, and in 1204 received from Philip Augustus a communal charter. The possession of the place was disputed between French and English in the Hundred Years' War, and between Catholics and Protestants at a later date. Louis XIII. took it from the Protestants in 1629 and deprived it of its fortifications, its privileges, and its very name, which he wished to change into Bourg-Louis.

ST JOHN, capital of St John county and the largest city of the province of New Brunswick, is strikingly situated at the mouth of the river of the same name, in 45° 14' 6" N. lat. and 66° 3' 30" W. long (see vol. xvii., plate IV.). It stands on an elevated rocky peninsula which projects into the harbour for a considerable distance. The latter, which is protected by batteries and never freezes, is well equipped with wharves and docks, and is capable of accommodating ships of the largest size. Its entrance is guarded by Partridge Island, lying 2 miles south of the city, and containing the quarantine hospital and lighthouse. About 1½ miles north of the lighthouse is situated the Beacon, and below the town east of the channel is the breakwater, 2250 feet long. The St John river enters the harbour through a rocky and sharply defined gorge, 100 yards wide and about 400 long, having a total fall of about 17 feet, which is passable to ships for forty-five minutes during each ebb and flow of the tide. The river has alternately an inward and an outward fall twice

every twenty-four hours, the high-water tide level immediately below the gorge being 6 to 8 feet higher than the average level above the gorge. The river is here spanned by a stanch suspension bridge 640 feet long and 100 feet above low-water level, and a cantilever railway bridge, 2260 feet long, with a river span of 825 feet, was opened

Plan of St John, New Brunswick.

in 1885. The city, approached from the sea, presents a bold and picturesque appearance, and, next to Quebec, possesses more natural beauty than any other town in Canada. There are three large public squares, and the streets (lighted with gas and the electric light) are regularly laid out. The water supply is derived from Little river, 5 miles distant, and brought to the city by three separate mains with an aggregate capacity estimated at 10,000,000 gallons daily; the present daily consumption (including that of the city of Portland) is 5,000,000 gallons. The works, which are owned by the city, cost \$992,326. The water supply of St John (West) is derived from Spruce Lake. St John (East) has also an admirable sewerage system.

On the 20th of June 1877 two-fifths of St John (about 200 acres) were destroyed by a fire, which in nine hours burned over \$27,000,000 worth of property. The city was quickly rebuilt, and on a much grander scale, many brick and stone edifices taking the place of the old landmarks, which were principally composed of wood. The chief buildings are—the Roman Catholic cathedral, Trinity, St Andrew's, the Stone, St David's, the Centenary, German Street Baptist, and Leinster Street Baptist churches, the custom-house, post-office, city-hall, savings bank, Wiggins's Orphan Asylum, Victoria skating-rink, lunatic asylum, Victoria and Madras schools, the Masonic and Oddfellows' halls, the young men's Christian association building, the general public, the epidemic, and the marine hospitals, the court-house, jail, police office, and mechanics' institute (with a reading-room, library, and museum). There are thirty-three places of worship (Church of England 6, Roman Catholic 3, Presbyterian 7, Wesleyan Methodist 5, Baptist 6, Congregationalist 1, Methodist Episcopal 1, Christian Brethren 1, Disciples of Christ 2, and Christadelphians 1); the educational institutions consist of a grammar-school, a Madras school, Baptist seminary, and

several public and private schools and academies. St John has also a free public library, numerous religious, charitable, scientific, and literary societies, and three daily newspapers. Carleton, on the opposite side of the river, and connected with the east side by ferry, is included within the corporation limits, and is represented in the common council. The population in 1871 was 28,805, in 1881 it was 26,127 (males 12,263, females 13,864), the decrease being caused by the great fire of 1877, when many persons left the city.

St John is the entrepôt of a large extent of country, rich in minerals, agricultural produce, and timber. It is the seat of an extensive business connexion, and possesses first-class means of communication both by steamships and sailing vessels and by railways. Of late years its maritime and manufacturing interests have been greatly extended. The chief articles of manufacture are iron-castings, steam engines and locomotives, railway cars, coaches and carriages, machinery, edge-tools, nails and tacks, cotton and woollen goods, furniture, wooden ware, leather, boots and shoes, soap and candles, agricultural implements, lumber, sugar-boxes, paper, boats, sails, &c. The fisheries afford employment to about 1000 men, and shad, salmon, hoolibut, cod, herrings, alewives, sturgeons, and haddock comprise the chief varieties taken. The exports (\$4,310,576 in 1884) consist of fish, lumber, woollen and cotton goods, manufactured articles, &c.; the imports (\$4,621,691 in 1884) are tobaccos, sugar and molasses, spirits and malt liquors, dried fruits, coffee, tea, silks, velvets, &c. The following figures represent the movement of the coasting trade in 1884:—vessels arrived 1864, tonnage 117,566, men 7340; vessels departed 1941, tonnage 105,050, men 6875. The number of entrances from foreign ports was 1904 (486,471 tons), of clearances 1961 (517,415 tons). The vessels on the registry books (31st December 1884) numbered 677, with a tonnage of 251,136; 53 vessels were built in that year with a tonnage of 18,989. The taxable property in 1885 was—real estate \$9,122,000, personal \$9,153,300, income \$2,833,900, total \$21,109,200. The corporation affairs are managed by a mayor, elected by the people annually, and a city council of eighteen members. St John city and county return three members to the House of Commons of Canada, and six members to the House of Assembly of New Brunswick. The climate, though healthy, is changeable, the pleasantest season being the autumn. The highest temperature observed since 1860 was 87° Fahr., and the lowest—22° Fahr., the mean temperature for spring, summer, autumn, and winter respectively being 36°·9, 58°, 45°, and 20°·6. The number of schools is 81, with 4171 pupils (average daily attendance 2722). Besides the libraries belonging to the city and the mechanics' institute, there are large collections of books open to members of the young men's Christian association and the Church of England institute. Navigation on St John river opens on 15th April and closes on 26th November.

De Monts visited St John in 1604, but it was not until 1635 that a regular settlement of the place was made, when Charles de la Tour founded a colony, which existed under French rule, with varying fortunes, until 1758, when it finally passed under British control. In 1764 the first Scottish settlers arrived in New Brunswick, and in 1783 the Loyalists landed at St John and established the city. It was called Parr Town, in honour of Governor Parr, until 1785, when it was incorporated with Conway (Carleton) under royal charter, as the city of St John.

ST JOHN, CHARLES WILLIAM GEORGE (1809-1856), naturalist and sportsman, was the son of General the Hon. Frederick St John, second son of Frederick, second viscount Bolingbroke, and was born 3d December 1809. He was educated at Midhurst School, Sussex, and about 1828 obtained a clerkship in the treasury, but, after joining some friends in various expeditions to the Highlands of Scotland, he found his duties so irksome that he resigned in 1834. The same year he married a lady with some fortune, and was thus enabled to gratify his taste for the life of a sportsman and naturalist. He ultimately settled in the "Laigh" of Moray, "within easy distance of mountain sport, in the midst of the game and wild animals of a low country, and with the coast indented by bays of the sea, and studded with freshwater lakes, the haunt of all the common wild fowl and many of the rarer sorts." In 1853 a paralytic seizure permanently deprived him of the use of his limbs, and for the benefit of his health he removed to the south of England. He died at Wootton near Southampton on 22d July 1856.

He wrote several books on sport, which record the results of accurate observations on the habits and peculiarities of the birds

and wild animals of the Highlands. They are written in a pleasant and graphic style, and illustrated with engravings, many of them from pen-and-ink sketches of his own, in which the traits and features of the animals are depicted, though in rough outline, yet with almost the vividness of life. His works are *Wild Sports and Natural History of the Highlands* (1846, 2d ed. 1848, 3d ed. 1861); *Tour in Sutherland* (1849, 2d ed., with recollections by Captain H. St John, 1884); *Notes of Natural History and Sport in Morayshire*, with Memoir by C. Innes (1863, 2d ed. 1884).

SAINT-JOHN, HENRY. See BOLINGBROKE.

ST JOHN, JAMES AUGUSTUS (1801-1875), traveller and author, was born in Carmarthenshire, Wales, on 24th September 1801. After attending a village grammar-school he received private instruction from a clergyman in the classics, and also acquired proficiency in French, Italian, Spanish, Arabic, and Persian. At the age of seventeen he went to London, where he obtained a connexion with a Plymouth newspaper, and, along with James Silk Buckingham, became editor of the *Oriental Herald*. In 1827, along with D. L. Richardson, he founded the *London Weekly Review*, which was subsequently purchased by Colburn and transformed into the *Court Journal*. About 1829 he left London for Normandy, and in 1830 published an account of his experiences there under the title *Journal of a Residence in Normandy* (2 vols.). After spending some time in Paris and Switzerland he set out for Nubia and Egypt, visiting the second cataract in a small vessel. He made important discoveries in regard to volcanic agencies on both sides of the Nile, and found traces of volcanic agency in the Libyan Desert. He also explored the antiquities connected with the religion of ancient Egypt. The results of his journey were published under the titles *Egypt and Mohammed Ali*, or *Travels in the Valley of the Nile* (2 vols., 1834), *Egypt and Nubia*, (1844), and *Isis, an Egyptian Pilgrimage* (2 vols., 1853). He died on 22d September 1875.

St John was also the author of *Lives of Celebrated Travellers* (1830), *Anatomy of Society* (1831), *History, Manners, and Customs of the Hindus* (1831), *Margaret Ravenscroft, or Second Love* (8 vols., 1835), *The Hellenes, or Manners and Customs of Ancient Greece* (1842), *Sir Cosmo Digby, a novel* (1844), *Venus in Borneo* (1847), *There and Back Again in Search of Beauty* (1853), *The Nemesis of Power* (1854), *Philosophy at the Foot of the Cross* (1854), *The Preaching of Christ* (1855), *The Ring and the Veil, a novel* (1856), *Life of Louis Napoleon* (1857), *History of the Four Conquests of England* (1862), *Weighed in the Balance, a novel* (1864), and *Life of Sir Walter Raleigh* (1868). He also edited, with notes, various English classics.

Of his four sons, all of some literary distinction—Percy Bolingbroke, Bayle, Spenser, and Horace Roscoe—the second, BAYLE ST JOHN (1822-1869), predeceased him. He was educated privately, and began contributing to the periodicals when only thirteen. At the age of twenty he wrote a series of papers for *Fraser* under the title "De Re Vehiculari." To the same magazine he contributed a series of essays on Montaigne, and, after continuing his studies on the same subject for some time, he published in 1857 *Montaigne the Essayist, a Biography*, in 4 volumes. In 1846 he passed through France and Italy on his way to Egypt, where, during a residence of two years, he wrote *The Libyan Desert* (1849). On his return he settled for some time in Paris and published *Two Years in a Levantine Family* (1850) and *Views in the Oasis of Siwah* (1850). After a second visit to the East he published *Village Life in Egypt* (1852). From this time he continued until twelve months of his death to reside in France, and as the result of his residence there published *Purple Tints of Paris: Characters and Manners in the New Empire* (1854), *The Louvre, or Biography of a Museum* (1855), and *The Subalpine Kingdom, or Experiences and Studies in Savoy* (1856). He was also the author of *Travels of an Arab Merchant in the Soudan* (1854), *Marettimo, a Story of Adventure* (1856), and *Memoirs of the Duke of Saint-Simon in the Reign of Louis XIV.* (4 vols., 1857).

SAINT JOHN OF JERUSALEM, KNIGHTS OF THE ORDER OF (see KNIGHTHOOD). In the year 1023 certain merchants of Amalfi obtained permission from the caliph of Egypt to establish a hospital in Jerusalem for the use of "poor and sick Latin pilgrims." The hospice prospered far beyond the hopes of its founders, and grateful travellers spread its fame throughout Europe and sent offerings to

its funds, while others voluntarily remained behind to assist actively in its pious purposes. With its increased utility organization became necessary, and in this organization is to be found the origin of the Order of Saint John. When Jerusalem was taken by Godfrey de Bouillon (see CRUSADES), his wounded soldiers were tended by Peter Gerard, rector of the Amalfi hospital of St John, and the more wealthy of the crusaders eagerly followed the example of their leader in endowing so useful and so practical an institution. Many of the Christian warriors sought permission to join the ranks of the fraternity. At the proposal of Gerard a regularly constituted religious body was formed; the patriarch of Jerusalem invested every approved candidate with a black robe bearing on the breast an eight-pointed white cross and received in return a vow of poverty, obedience, and chastity. In 1113 Pope Paschal II. formally sanctioned the establishment of the order by a bull. Five years later Gerard was succeeded by Raymond du Puy, and under his auspices the monastic knights took a fresh oath to become militant defenders of the cause of the Cross. During the first century of its existence the fraternity thus acquired a religious, republican, military, and aristocratic character. The rules introduced by Raymond du Puy became the basis of all subsequent regulations; the leading members of the hospital or master's assistants were formed into an all-powerful council, which divided the order into knights of justice, chaplains, and serving brethren. There was also an affiliation of religious ladies (*dames*) and of *donats* or honorary members. The income of the body corporate was derived from landed property in all parts of Europe. To facilitate the collection of rents, commanderies (first called preceptories) were formed. These gradually acquired the character of branch establishments where candidates were received and the same observances practised as in the parent convent. Raymond du Puy twice repulsed the advancing Turks; and Hugh de Payens, fired by the successes of the Hospitallers, founded the sister order of the Temple. In 1160 Raymond du Puy died. The rule of his immediate successors was uneventful; Gilbert d'Ascali greatly weakened the influence of the order by joining (1168) in an ill-fated expedition to Egypt. Roger Desmoulins, the eighth master, was killed fighting against Saladin before Jerusalem, while his successor, Garnier de Napoli, died of the wounds he received in the decisive battle of Tiberias, which led to the surrender of Jerusalem to the Moslems in 1187. The seat of the order was now transferred to Margat, a town which still remained in the possession of the Christians, and it becomes difficult to trace the frequent changes of the mastership. The dangerous enmity which arose between the Hospitallers and the Templars necessitated the energetic intervention of the pope. In 1216 Andrew, king of Hungary, was received into the order. The brief occupations of Jerusalem by the emperor Frederick II. (1228) and by Richard of Cornwall (1240) had little appreciable effect on the waning fortunes of the Hospitallers. A savage horde from the borders of the Caspian advanced against the Christians, and in the final struggle with the Chorasmians the masters of both orders—united before the common enemy—fell with nearly the whole of their followers (1244). William de Chateaufort, elected to the mastership by the few survivors, repaired to Acre only to take part in the fruitless crusade of Louis of France. The truce between the rival orders was doomed to be of short duration. In 1259 their armies met in a general engagement, and victory rested with the Hospitallers. A brief period of success in 1281 was powerless to avert the fall of Margat, and in 1289 Acre alone remained in the hands of the Christians. John de Villiers, a man of singular ability, became at this critical juncture master of the order. An overwhelming force

was sent from Egypt to besiege Acre, which only fell after a desperate resistance. Under cover of the arrows of their archers the knights sailed for Cyprus (1291). Repeated acts of prowess by sea still served to remind the Moslem corsairs of the survival of their implacable foes. De Villiers died three years later and was succeeded by Odon de Pins, who tried ineffectually to restore the purely conventional character of the order. William de Villaret (elected in 1300) shared the dangers of an expedition to Palestine and prepared for the conquest of Rhodes, which was effected in 1310 by his brother and successor. The revenues of the Hospitallers were now augmented from the confiscated estates of their old rivals the Templars. Fulk de Villaret was attacked at Rhodes by Osman, ruler of Bithynia, but with the assistance of Amadeus of Savoy he defeated the invaders. A serious difference which arose between De Villaret and his subordinate knights enabled Pope John XXII. to appoint his nominee John de Villanova (1319). It was at this period that the order was divided into the seven *langues* of France, Provence, Auvergne, Italy, Germany, England, and Aragon. In 1346 De Gozon became grand-master. His administration and that of his immediate successors are only remarkable for a perpetual struggle for supremacy with the papal court. In 1365 Raymond Beranger captured Alexandria in concert with the king of Cyprus, but the victors contented themselves with burning the city. Philibert de Naillac had no sooner been elected grand-master than he was summoned to join the European crusade against the sultan Bajazet, and took part in the disastrous battle of Nicopolis. The Greek emperor unfortunately invoked the aid of Timur, who overthrew Bajazet, but followed up his success by an attack on Smyrna, the defence of which had been entrusted to the knights. Smyrna was taken and its brave garrison put to the sword. In 1440 and 1444 De Lastic defeated two expeditions sent against him from Egypt. Nine years later Constantinople fell at last into the hands of the Turks. It was evident to the knights that an attack on their sanctuary would follow the triumph of Islam, but it was not till 1480 that the long-dreaded descent on Rhodes took place. Fortunately for the order, Peter d'Aubusson was grand-master, and the skilfully planned attack of the three renegades was valorously repulsed. The heroic D'Aubusson recovered from his wounds, restored the shattered fortifications, and survived till 1503. Nearly twenty years passed away before the sultan Solymán determined to crush the knights, who had just elected L'Isle d'Adam as their chief. After a glorious resistance, D'Adam capitulated and withdrew with all the honours of war to Candia (Crete). Charles V., when the news of the disaster reached him, exclaimed, "Nothing in the world has been so well lost as Rhodes," and five years later (1530), with the approval of the pope, ceded the island of Malta and the fortress of Tripoli in Africa to the homeless knights. Peter Dupont succeeded D'Adam in 1534, and in the following year took a prominent part in the emperor's famous expedition against Tunis. The position in Tripoli was from the first precarious, and it was surrendered to the corsair Dragut in 1551. In 1557 John La Valette was chosen grand-master. The construction of fresh fortifications was hastened and every precaution taken against a surprise. On the 18th May 1565 the Turkish fleet under the redoubtable Dragut appeared in sight and one of the most celebrated sieges in history began. It was finally raised on the 8th September after the death of Dragut and 25,000 of his followers. The city of Valetta afterwards rose on the scene of this desperate struggle. La Valette died in 1568, and no events of importance mark the grand-masterships of De Monte (1568), De la Cassière (1572), and Verdala (1581). During their terms

of office the cathedral, the *auberges*, the hospital, and many remarkable edifices were built. Another city gradually arose on the opposite shores of the grand harbour, and the once barren island became almost imperceptibly the site of one of the strongest fortresses and most flourishing commercial communities in the Mediterranean. Verdala was succeeded by Martin Garces (1595), but it was reserved for Alof de Vignacourt to revive for a time the military reputation of the order. Vasconcellos, De Paula, and Lascaris were all aged men when, one after another, they were called to the supreme power, and their election (with a view to secure frequent vacancies) contributed to weaken the vitality of the fraternity. Lascaris lived till the age of ninety-seven, built the fortifications of Floriana, endowed Valetta with a public library, and resisted the growing encroachments of the Jesuits. Martin de Redin and Raphael Cottoner ruled each for three years. Nicholas Cottoner was elected in 1663, and the knights of St John once again distinguished themselves in the siege of Candia. The losses which the order sustained in the repulse of the allies before Negropont (1689) was the indirect cause of the death of Caraffa, who was succeeded by Adrian de Vignacourt (1690), Raymond Perellos (1697), Zondodari (1720), De Vilhena (1722), Despuig (1736), and Pinto (1741). Emmanuel Pinto was a man of no mean ability and of considerable force of character. He steadily resisted all papal encroachments on his authority, expelled the Jesuits from Malta, and declined to hold a chapter-general. After the brief rule of Francis Ximenes, Emmanuel de Rohan became grand-master (1775). He assembled a chapter-general, erected the Anglo-Bavarian *langue*, and sent his galleys to relieve the sufferers from the great earthquake in Sicily. The order never perhaps seemed to all outward appearances more prosperous than when the storm of the French Revolution broke suddenly upon it. In 1792 the Directory decreed the abolition of the order in France and the forfeiture of its possessions. Five years afterwards De Rohan died. He had taken no pains to conceal his sympathy for the losing cause in France and his court had become an asylum and home for many French refugees. His successor Ferdinand Hompesch was perhaps the weakest man ever elected to fill a responsible position in critical times. On the 12th April 1798 the French Government resolved on the forcible seizure of Malta. Warnings were sent to the grand-master in vain. Within two months from that date the island was in the hands of Bonaparte, and Hompesch was permitted to retire to Trieste with some of the most cherished relics of the order.

Subsequent to the departure of Hompesch a number of the knights who had taken refuge at St Petersburg elected the emperor Paul grand-master. Notwithstanding the patent illegality of the proceeding the proffered honour was eagerly accepted and duly announced to all the courts of Europe (October 1798). Hompesch was induced to resign in the following year. On the death of Paul an arrangement was arrived at which vested the actual nomination in the pope. From 1805 to 1879 only lieutenants of the order were appointed, who resided first at Catania, then at Ferrara, and finally at Rome. In 1879 Leo XIII. made Giovanni Battista Ceschi grand-master, and he actually rules over portions of the Italian and German *langues* and some other scattered groups of the ancient fraternity.

Two other associations also trace their origin from the same parent stock—the Brandenburg branch and the English *langue*. The former can claim an unbroken existence since its establishment in 1160. In 1853 the king of Prussia (in whom the right of nomination had been vested since 1812) restored the original bailiwick of Brandenburg and the assembled commanders elected Prince Charles of Prussia *Herrn Meister*, who notified his election to the lieutenant of the grand-master at Rome. The "Johanniter" did good service in the German campaigns of 1866 and 1870. As regards the English *langue*, 1 Elizabeth c. 24 annexed to the crown all the property of the order in England. After the restoration of the Bourbons the French knights met once more in chapter-general and elected a permanent capitular commission, which was officially recognized by both Louis XVIII. and the pope. After certain negotiations, the three French *langues*, acting in accord with those of Aragon

and Castile, agreed to the resuscitation of the dormant *langue* of England (1827-1831), and Sir Robert Peat was appointed lord prior, taking the customary oath *de fidelis administratione* in the Court of King's Bench. During the past half century the good work done by the modern knights—now (1886) once more located in St John's Gate, Clerkenwell—can honourably compare with the memorable deeds of their predecessors. The establishment of the hospice at Jerusalem is due to the energy and zeal of Sir Edmund Lechmere, who has been mainly instrumental in collecting at St John's Gate the unrivalled historical literature of which the order can boast.

There are few subjects of study which present so rich and so varied materials as the annals of the knights of St John. The archives still preserved in Malta are almost unique in their value and completeness, and each grand-master patronized and encouraged the industrious historiographers who sought to perpetuate the fame of the order to which they belonged. The work of Giacomo Bosio is an elaborate and generally trustworthy record of events from the time of Gerard down to the year 1571. Bartolomeo del Pozzo treats with equal care the period between 1571 and 1686. Editions of these volumes were published in Rome, Naples, Verona, and Venice. The Abbé Vertot concludes his elaborate history with the year 1726. His book enjoyed a considerable popularity, was published in English with the original plates in 1728, but can hardly claim the confidence to which Bosio and Del Pozzo are both entitled. From the 16th century down to the appearance of the famous *Codice* of De Rohan (1782) we have a series of publications on the subject of the statutes of the order. A fresh compilation seems generally to have followed each assembly of the chapter-general. Before the time of De Rohan the best-known edition was that of Borgofante (1676), but Bosio produced a translation from the Latin in 1689 when residing at Rome as agent of the grand-master, and another was printed at the press of the order in Malta in 1718. The *Mémoires de l'Ordre* by Bodoni (Parma, 1780) may also be consulted with advantage. For information concerning the archaeology of the order and the antiquities of Malta itself reference should be made to Abela and Giantar's *Malta Illustrata*, dedicated to Em. Pinto in 1772; to Raphael Caruana's *Collezione di monumenti e lapidi sepolcrali di militi Gerosolimitani nelle chiese di San Giovanni* (Malta, 1838-40); to De Boisgelin's *Malta* (3 vols.); and to *Les Monuments des Grands Maîtres*, by Villeneuve-Bargemont (Paris, 1829). The last-named writer has, however, drawn largely on his own imagination for the earlier part of the information he professes to give. In English the most noteworthy treatises concerning the knights are John Taaffe's *History of the Order of Malta* (London, 1852, 4 vols.) and General Porter's *History of the Knights of Malta of the Order of St John of Jerusalem* (London, 1888). The Rev. W. R. Bedford has recently published a valuable account of the great hospital at Valetta. A useful guide to the contents of the Malta Record Office is to be found in M. Delaville Le Roulx's *Archives de l'Ordre de St Jean de Jerusalem* (Paris, 1883). (A. M. B.)

ST JOHN'S, the capital of Newfoundland, is situated on the eastern shore of the island, 60 miles north of Cape Race, in 47° 33' 33" N. lat. and 52° 45' 10" W. long. (see vol. xvii., plate V.). It is 10° 52' east of Halifax, and stands on what is nearly the most eastern point of America, —Cape Spear, 5 miles south of St. John's, alone projecting a little farther towards the Old World. It is 1000 miles nearer than New York to England, and but 1640 from the coast of Ireland. The approach to the harbour of St John's presents one of the most picturesque views along the coast of America. In a lofty iron-bound coast a narrow opening occurs in the rocky wall, guarded on one side by Signal Hill (520 feet) and on the other by South Side Hill (620 feet), with Fort Amherst lighthouse on a rocky promontory at its base. The entrance of the Narrows is about 1400 feet in width, and at the narrowest point, between Pancake and Chain Rocks, the channel is not more than 600 feet wide. The Narrows are half a mile in length, and at their termination the harbour trends suddenly to the west, thus completely shutting out the swell from the ocean. Vessels of the largest tonnage can enter at all periods of the tide. The harbour is a mile in length and nearly half a mile in width. At its head is a dry dock, recently completed at a cost of \$550,000; it is 600 feet in length, 83 in breadth, and 26 in depth, capable of admitting the largest steamers afloat. The city is built on sloping ground on the northern side of the harbour, on the southern side of which the hills rise so abruptly from the water that there is only room for a range of warehouses and oil-factories. Three principal streets, winding and irregular, follow the sinuosities of the harbour and of one another the whole length of the city, and these are intersected by a number of cross-streets. Water Street, the principal business locality, presents a very substantial, though not handsome, appearance, the houses being of stone or brick. Shops, stores, and counting-houses occupy the ground floor, while many of the merchants and shop-keepers live in the upper stories. Fish-stores, warehouses, and wharves project from behind on the side next the harbour. The city, three-fourths of which are still of

wood, is rapidly extending in several directions, and in recent years many dwelling-houses of an improved description have been erected. There is an abundant supply of excellent water, brought in pipes from a lake 5 miles off. Epidemics are rare, and the city is very healthy. Of the public buildings the most important are Government House, a substantial and spacious building erected in 1828 by the Imperial Government; the colonial building (1847), containing the chambers of the legislature and Government offices; the athenæum (1877), containing a public hall, library, reading-room, savings bank, museum, &c. The foundation of a new post-office was laid in the same year. The churches are—the Church of England and Roman Catholic cathedrals, St Thomas's and St Mary's (Church of England), St Patrick's, three Methodist churches, St Andrew's Presbyterian church, and the Congregational church. The manufacture of seal and cod oils has long been carried on upon an extensive scale. Of late years other manufactures have been introduced, and have made considerable progress. There are three iron-foundries, two large machine-shops, two boot and shoe factories, a nail-factory, three furniture-factories, two tobacco-factories, soap-works, two tanneries, and a large and well-equipped factory for the manufacture of cables, ropes, twines, nets, seines, &c. The export trade in fish of various kinds, fish oils, seal oil, and seal skins is very large; the greater part of all the imports into Newfoundland also arrives at St John's. The city is not yet (1886) incorporated, the Colonial Board of Works having charge of all civil affairs. The population, which in 1780 was 1605, had in 1801 increased to 3420, in 1812 to 7075, in 1835 to 15,000, and in 1874 to 23,890, and in 1884 it was 28,610 (Roman Catholics, 17,693; Episcopalians, 5741; Methodists, 3715; Presbyterians, 973; Congregationalists, 465; other denominations, 23). The census last mentioned also shows the population of the whole island and Labrador to be 197,589, being an increase of 36,209 since 1874, or at the rate of about 22 per cent. in ten years. The population of the Atlantic coast of Labrador, which is under the jurisdiction of Newfoundland, was 4211,—1347 being Eskimo.

ST JOHNSBURY, a township of the United States, capital of Caledonia county, Vermont, on the Passumpsic river (a tributary of the river Connecticut), about 50 miles south of the Canadian frontier, and on the railway between Boston (205 miles) and Montreal. St Johnsbury is the seat of perhaps the largest scale-factory in the world, which employs about 1000 hands and works up 6000 tons of iron per annum. The township contains an athenæum, public library (12,000 vols.), and art gallery. The population has increased from 2758 in 1850 to 4665 in 1870 and 5800 in 1880. The three villages are distinguished as St Johnsbury (3360 in 1880), St Johnsbury Centre, and St Johnsbury East. Founded in 1786, the township received its name in honour of St John de Crèvecoeur, French consul at New York, and a benefactor of Vermont.

ST JOSEPH, a city of the United States, capital of Buchanan county, Missouri, on the right bank of the Missouri, 260 miles west by north of St Louis. It is an important railway junction, possessing since 1873 a great road and railway bridge over the river constructed of iron; in the extent of its wholesale business it ranks as the third city in the State; and among its manufacturing establishments are flour-mills, starch-works, boot and shoe factories, pork-packing establishments, waggon-factories, a distillery, &c. Besides a city-hall and market-house, it contains a court-house (1875), an opera-house, a State lunatic asylum (1874), an agricultural and mechanical exposition association, a Roman Catholic cathedral, and five public libraries. The population was 8932 in 1860, 19,565

(1512 coloured) in 1870, and 32,431 (3227 coloured) in 1880.

Founded in 1843 by Joseph Robidoux, a French Roman Catholic, who had settled in the district some years previously as a trader, St Joseph in 1846 was made the county seat, and before 1857, when it received its first city charter, became well known as the great point of departure for emigrants bound for California and the West. During the Civil War, when it was fortified by the Federals, its natural development was considerably checked, but this revived as soon as the struggle was over.

SAINT-JUST, ANTOINE (1767-1794), French revolutionary leader, was born at Decize in the Nivernais on 25th August 1767. He was educated at Soissons, and showed his character at school as ringleader of a plot to set the school buildings on fire. Saint-Just was caught red-handed in the act of incendiarism, and, refusing to exhibit any tokens of submission, was ignominiously expelled. His education, however, does not appear to have been neglected; and the reports and speeches of his short and stormy political career exhibit not a little scholarship, and in particular considerable acquaintance with ancient history. Intoxicated with republican ideas, Saint-Just threw himself with enthusiasm into the political troubles of his time, had himself appointed an officer in the National Guard, and by fraud—he being yet under age—admitted as a member of the electoral assembly of his district. Ambitious of fame, he in 1789 published twenty cantos of licentious verses under the title of *Organt*, and this work was afterwards reissued under the title of *My Pastimes; or The New Organt*. From that year onwards, however, the open turbulence of his youth gave place to a rigorously stoical demeanour, which, united to a policy tyrannical, uncompromisingly thorough, and pitilessly severe, became the marked and startling characteristic of his life. He now entered into correspondence with Robespierre, who thenceforward became his hero and ideal. Robespierre invited him to Paris, felt flattered by his worship, saw that he suited his purpose, and in a short time the two became hand and glove. Thus supported, Saint-Just became deputy of the department of Aisne to the national convention, where he made his first speech—gloomy, fanatical, remorseless in tone—on 19th November 1792. He had but twenty months to live; but into these he seemed to crowd the life of twenty years. In the convention, in the Jacobin Club, and among the populace his relations with Robespierre became known, and he was dubbed the “St John of the Messiah of the People.” Hardly a week passed without the attention of France being arrested by his attitude or his utterances. Both were anxiously watched, as the unfailing indication of the trend of Robespierre's designs. His appointment as a member of the committee of public safety now placed him at the very height and centre of the political fever-heat. In the name of this committee he was charged with the drawing up of reports to the convention upon the absorbing themes of the overthrow of the party of the Gironde, thereafter, when even the “Mountain” seemed to have fallen in pieces, of the Hébertists, and finally, as the tragic sequel to the rupture between Robespierre and Danton, of that denunciation of the latter which consigned him and his followers to the guillotine. What were then called reports were far less statements of fact than appeals to the passions; in Saint-Just's hands they furnished the occasion for a display of fanatical darning, of gloomy eloquence, and of undoubted genius; and—with the shadow of Robespierre behind them—they served their turn. Once a flash of cruel humour lighted up his angry retorts, and it became memorable. Desmoulins, in jest and mockery, said of Saint-Just—the youth with the beautiful cast of countenance and the long fair locks—“He carries his head like a Holy Sacrament.”

"And I," savagely replied Saint-Just, "will make him carry his like a Saint-Denis." The threat was not vain: Desmoulins accompanied Danton to the scaffold. The same ferocious inflexibility animated Saint-Just with reference to the external policy of France. He proposed that the national convention should itself, through its committees, direct all military movements. This was agreed to, and Saint-Just was despatched to Strasburg, in company with Lebas, to superintend operations. It was suspected that the enemy without was being aided by treason within. Saint-Just's remedy was direct and terrible: he followed his experience in Paris, "organized the Terror," and soon the heads of all suspects were falling under the guillotine. The conspiracy was defeated, and the armies of the Rhine and the Moselle having been inspirited by success—Saint-Just himself taking a fearless part in the actual fighting—and having effected a junction, the frontier was delivered. Later, with the army of the North, he wrought similar magical changes in the aspect of affairs. Before the generals he placed the terrible dilemma of victory over the enemies of France or trial by the dreaded revolutionary tribunal; and before the eyes of the army itself he organized a force which was specially charged with the slaughter of those who should seek refuge from the enemy by flight. Success again crowned his terrible efforts, and Belgium was gained for France. Meanwhile affairs in Paris looked gloomier than ever, and Robespierre recalled Saint-Just to the capital. As the storm was gathering Saint-Just gave it direction by mooted the dictatorship of his master as the only remedy for the convulsions of society. At last, at the famous sitting of the 9th Thermidor, he ventured to present as the report of the committees of general security and public safety a document expressing his own views, a sight of which, however, had been refused to the other members of committee on the previous evening. Then the storm broke. He was vehemently interrupted, and the sitting ended with an order for Robespierre's arrest (see ROBESPIERRE). On the following day, 28th July 1794, twenty-two men, nearly all young, were guillotined. Robespierre was one, aged thirty-six; Saint-Just another, aged twenty-six.

In 1800 there was published at Strasburg a work from the pen of Saint-Just entitled *Fragments on Republican Institutions*. It is a crude mixture of his opinions on social and political topics.

ST KILDA, the largest islet of a small group of the Outer Hebrides, Scotland, 40 miles west of North Uist, in 57° 48' 35" N. lat. and 8° 35' 30" W. long. It measures 3 miles from east to west and 2 from north to south, and has an area of 3000 to 4000 acres. Except at the landing-place on the south-east, the cliffs rise sheer out of deep water, and on the north-east side the highest eminence in the island, Conagher or Conna-Ghair, forms a gigantic precipice, 1220 feet high from sea to summit. According to Professor Judd, St Kilda is probably the core of a Tertiary volcano; but, besides volcanic rocks, it is said to contain hills of sandstone in which the stratification is very distinct.¹ While the general relief is peculiarly bold and picturesque, a certain softness of scenery is produced by the richness of the verdure. The inhabitants are an industrious Gaelic-speaking community (110 in 1851, and 77 in 1881). They cultivate about 40 acres of land (potatoes, oats, barley), keep about 1000 sheep and 50 West Highland cows, and catch puffins and other sea-fowl. Coarse tweeds and blanketing are manufactured for home use. The houses are collected in a little village at the head of the East Bay, which contains a Free church, a manse, and the factor's house. The island is practically inaccessible for eight months of the year.

¹ No trained geologist seems to have visited the island subsequent to Macculloch.

St Kilda, or, as it was originally called, Hirt (Hirth, Hyrtha), seems to have been in the possession of the Macleods for 400 or even 500 years. In 1779 it changed hands along with Harris, and again in 1804 and in 1871 (to Macleod of Macleod). The feudal superior is Lord Dunmore, who receives one shilling of feu-duty. From 1734 to 1742 Lady Grange was confined on St Kilda by command of her high-handed husband (see *Proceed. Soc. Scot. Antiq.*, x. and xi.). David Mallet makes the island the scene of his *Amyntor and Theodore, or the Hermit*. See works on St Kilda by Rev. K. Macaulay (1764), L. MacLean (1838), J. Sands (1876 and 1877), and George Seton (1878).

ST KILDA, a watering-place in Victoria, Australia, on the east shore of Hobson's Bay, 3½ miles south of Melbourne, with which it is connected by a railway. The borough had an area of 1886 acres and a population of 11,662 in 1881. The sea-beach is bordered by an esplanade; there is a large public park; and portions of the sea have been fenced-in to protect bathers from sharks. A town-hall, an assembly hall, a library, and the large Episcopal church of All Saints are among the public buildings.

ST KITTS. See ST CHRISTOPHER.

SAINT-LAMBERT, JEAN FRANÇOIS DE (1716-1803), French poet, was born at Nancy in 1716, and died at Paris in 1803. During great part of his long life he held various employments at the court of Stanislaus of Poland, when that prince was established in Lorraine. He also served in the French army, and then betook himself to literature, producing among other things a volume of descriptive verse, *Les Saisons* (wildly overpraised at the time, and now never read), many articles for the *Encyclopédie*, and some miscellaneous works in verse and prose. Saint-Lambert's chief fame, however, comes from the strange fate which made him the successful rival in love of the two most famous men of letters in France, not to say in Europe, during the 18th century. The infatuation of the marquise du Châtelet for him and its fatal termination are known to all readers of the life of Voltaire. His subsequent courtship of Madame d'Houdetot, Rousseau's Sophie, though hardly less disastrous to his rival, was less disastrous to the lady, and continued for the whole lives of himself and his mistress. They survived till the present century as a kind of irregular Baucis and Philemon, illustrating the manners of the vanished régime, which had been not unjustly celebrated, and vindicating its constancy from a very general opinion.

ST LAWRENCE. The river St Lawrence² in North Plate America, taken in connexion with the great lakes, offers to IV. trading vessels the most magnificent system of inland navigation in the world. Its total length from the source Length. of the St Louis river, which discharges into Fond du Lac at the head of Lake Superior, to Cape Gaspé is 2100 miles. The river St Louis springs from the same spacious plateau in Minnesota that gives birth to the Mississippi and the Red River of the North. The intermediate distances between the source of the St Lawrence and its mouths are shown in Table I. According to the most recent surveys the approximate area of the basin of the St Lawrence is 510,000 square miles, of which 322,560 belong to Canada and 187,440 to the United States.

Lake Superior, the most westerly of the lakes, is the Lake largest body of fresh water in the world. In addition to the river Nipigon, which may be regarded as the chief source of the upper St Lawrence, and the Pigeon river, which forms the boundary between Manitoba and Minnesota, it receives its waters from 200 rivers, draining an aggregate of 85,000 square miles,³ including its own area of 32,000.

² The name given by Jacques Cartier, who ascended the river in 1535 as far as Montreal.

³ The magnitudes and altitudes of the great lakes are derived from the *Report of the Canadian Canal Commission*, February 1871; the engineering data relating to canals have been mainly obtained from other annual reports published by the Canadian Government and from the annual reports of the chief of engineers, United States army.

TABLE I.—*Distances of Sections of St Lawrence.*

Local Name.	From	To	Sections of Navigation.	Statute Miles.	
				Inter-mediate.	Total from Source of St Louis.
....	Source of St Louis river	Fond du Lac	St Louis river	152	152
....	Fond du Lac	Pointe aux Pins	Lake Superior	390	542
Saulte St Mary	Pointe aux Pins	St Joseph's I.	St Mary's river	55	597
....	St Joseph's I.	Sarnia	Lake Huron	270	867
St Mary river	Sarnia	Amerherst-burg	St Claire and Detroit river	76	943
....	Amerherst-burg	Port Colborne	Lake Erie	232	1175
Niagara river	Port Colborne	Port Dalhousie	Welland Canal	27	1202
....	Port Dalhousie	Kingston	Lake Ontario	170	1872
St Lawrence	Kingston	Prescott	Head of canal section	59	1431
	Prescott	Montreal	St Lawrence Canal section	119	1550
	Montreal	Three Rivers	Head of ocean navigation to head of tidal flow	86	1636

	Cape Chat ..	Cape Gaspé ..	Mouth of the Gulf of St Lawrence	124	2100
....	Cape Gaspé ..	Belle Isle ¹ ..		436	2536

Its length is 390 miles, its greatest breadth 160, and its mean breadth 80. Its mean depth is 900 feet and its altitude above the sea-level 600 feet. Its coast is generally rock-bound. Numerous islands are scattered about the north side of the lake, many rising precipitously to great heights from deep water,—some presenting castellated walls of basalt and others rising in granite peaks to various elevations up to 1300 feet above the lake. The Laurentian and Huronian rocks to the north along the shore abound in silver, copper, and iron ores. The United States side is generally lower and more sandy than the opposite shore, and is also especially rich in deposits of native copper and beds of red hæmatite iron ores. Both these minerals are extensively worked. Unfossiliferous terraces occur abundantly on the margin of the lake; at one point no fewer than seven occur at intervals up to a height of 33 feet above the present level of the water. Lake Superior is subject to severe storms and the effect of the waves upon the sandstone of the "picture rocks" of Grand Island presents innumerable fantastic and very remarkable forms. The lake never freezes, but cannot be navigated in winter on account of the shore ice. At the west end of the lake, at the mouth of the St Louis, is situated the city of Duluth, a place of considerable importance as the eastern terminus of the Northern Pacific Railway, and of the St Paul and Duluth Railway, which runs to St Paul on the Mississippi, 155 miles south of Duluth.²

St Mary's Lake Superior, and its course to Lake Huron is but a succession of expansions into lakes and contractions into rivers. St Mary's rapids, which in a distance of half a mile absorb 18 feet out of the total fall of 22 feet between the two lakes, are avoided by a ship canal, constructed in 1855.

As originally built, the canal was 1 mile long, had a width of 100 feet at the water line and a depth of 12 feet. The locks were two in number, combined, each 350 feet in length, 70 in width, with a lift of 9 feet. At the time the canal was made these dimensions were sufficient to pass any vessel on the lakes fully laden, but by 1870 it became necessary to provide for more rapid lockage and for the passage of larger vessels. Accordingly the old canal was

widened and deepened, and a new lock constructed, 515 feet long and 80 wide,—the width of the gates being 60 feet, the lift of the lock 18, and the depth of water on the mitre sills 17. There is now everywhere a navigable depth of 16 feet from Lake Superior through St Mary's Falls Canal and St Mary's river to Lake Huron. In 1883 the registered tonnage passing the canal was 2,042,295 tons,—the annual increase of tonnage during the previous fifteen years having averaged 107,813 tons. The United States Government engineers have already presented a project for still further improvements, namely, to replace the old locks by one only with a length of 700 feet and a width of 70, and with a depth of 21 feet on the sill.

Lake Huron is 270 miles long and 105 broad and has Lake an area of 23,000 square miles (the area of its basin, Huron. including the lake, being 74,000), a mean depth variously stated at from 700 to 1000 feet, and an altitude above the sea of 574 feet. Georgian Bay on the north-east lies entirely within the region of Canada, whilst Thunder Bay and Saginaw Bay on the west and south-west are in the State of Michigan. The north and north-east shores of Lake Huron are mostly composed of sandstones and lime-stones, and where metamorphic rocks are found the surface is broken and hilly, rising to elevations of 600 feet or more above the lake, unlike in this respect the southern shores skirting the peninsulas of Michigan and south-western Ontario, which are comparatively flat and of great fertility. As in Lake Superior, regular terraces corresponding to former water-levels of the lake run for miles along the shores of Lake Huron at heights of 120, 150, and 200 feet; and deposits of fine sand and clay containing freshwater shells rise to a height of 40 feet or more above the present level of the water. At several places these deposits extend to a distance of 20 miles inland. The chief tributaries of the lake on the Canadian side are the French river from Lake Nipissing, the Severn from Lake Simcoe, the Muskoka, and the Nottawasaga, all emptying into Georgian Bay; and on the United States side the Thunder Bay river, the Au-Sable, and the Saginaw.

Lake Michigan is entirely in the territory of the United States. It has a maximum breadth of 84 miles and its length is 345 miles from the north-west corner of Indiana and the north part of Illinois to Mackinaw, where it communicates with Lake Huron by a strait 4 miles wide at its narrowest part. Its depth is variously stated at from 700 to 1800 feet. Its altitude above sea-level is 578 feet. Its basin is 70,040 square miles in area, of which the lake occupies 22,400. Five of its tributaries are from 135 to 245 miles in length. The country round Lake Michigan is for the most part low and sandy. The rocks are lime-stones and sandstones of the Sub-carboniferous groups, lying in horizontal strata and never rising into bold cliffs. Along the south shore are Post-tertiary beds of clay and sand lying a few feet above the level of the lake, the waters of which probably at one time found their way by the valleys of the Illinois and the Mississippi into the Gulf of Mexico.

Chicago (population, 503,185 in 1880) is situated at the south-west angle of the lake. In the receipt and shipment of grain and pork it is the largest market in the world. In 1883 12,015 vessels with a tonnage of 3,980,837 tons cleared from the harbour. Comparing the decades of 1864-73 and 1874-83 the total export in quarters of wheat and corn from Chicago was as follows:—

	Lake.	Rail.	Total.
1864-73	43,884,196	6,328,397	50,212,593
1874-83	66,265,175	27,342,140	93,607,315
	110,149,371	33,670,477	143,819,848

In 1883 the export of grain by the lakes amounted to 6,850,722 quarters (of which 68·1 per cent. were shipped direct to Buffalo and only 6·3 per cent. to Kingston and Montreal) as against 3,146,000 sent by rail. The first appropriation for the harbour of Chicago,

is 313 feet above the level of Lake Superior, and in some parts is upwards of 500 feet in depth. The lake is thickly studded with islands; its shores are undulating and sometimes hilly; and owing to its numerous indentations its coast-line measures 580 miles.

¹ The distance from Belle Isle to Liverpool is 2234 statute or 1942 geographical miles.

² Lake Nipigon is situated 50 miles to the north of Lake Superior, into which it drains by the river Nipigon; it is still very little known except from the report of Professor Bell of the Geological Survey. It

made in 1883, was expended in cutting a straight outlet from the Chicago river into the lake. The available depth was only 2 feet, but since then the harbour accommodation has been extended, by means of piers, dredging, and a breakwater, to accommodate vessels of 14 feet draught.

The harbour works at Chicago, as well as at other lake and river ports, are constructed simply of cribs or boxes, composed of logs 12 by 12 inches, filled with stone, and joined to each other, after they have finally settled down, by a continuous timber superstructure raised a few feet above the level of the water. On this plan breakwaters, piers at the mouths of rivers, and wharves have been built within the last sixty years at the most important points along the shores of the St Lawrence lakes, as well as at most of the river harbours communicating with the Atlantic; and experience has proved that no cheaper and better system could have been devised for such localities.

St Clair river and lake. The St Lawrence leaves Lake Huron by the St Clair river at Sarnia, and after a course of 33 miles enters Lake St Clair, 25 miles long, and terminating at the head of the Detroit river, near the city of Detroit in Michigan. Eighteen miles farther on the St Lawrence, with a descent of 11 feet, enters Lake Erie. The navigation through the St Clair river is easy throughout, but in Lake St Clair there are extensive sandbanks covered with a depth of water varying from 6 to 10 feet. Previous to 1858 much inconvenience was experienced in navigating the lake owing to its insufficient depth; but at the end of that year the Governments of the United States and Canada dredged a canal through the bed of the lake, which is of soft material, to a minimum depth of 12 feet, with a width of 300 feet. This channel has since been deepened to 16 feet over a width of 200 feet, and works are now in progress to deepen the rocky shoal called the "Lime-Kiln Crossing" in the Detroit river to 18 feet, to enable vessels drawing 15 feet to pass with safety from lake to lake in stormy weather.

Lake Erie. The peculiar features of Lake Erie are its shallowness and the clayey nature of its shores, which are generally low. The south shore is bordered by an elevated plateau, through which the rivers, which are without importance as regards Lake Erie, have cut deep channels. The mean depth of the lake is only 90 feet and its maximum depth 204. Owing to its shallowness it is easily disturbed by the wind, and is therefore the most dangerous to navigate of all the great lakes. Its length is 250 miles and its greatest breadth 60. The area of the basin of Lake Erie is 39,680 square miles, including 10,000 square miles, the area of the lake. Its waters are 564 feet above the sea and 330 above Lake Ontario. The extreme difference observed in the level of the lake between 1819 and 1838 was 5 feet 2 inches, but the average annual rise and fall (taken on a mean of twelve years) is only 1 foot 1½ inches. The mean annual rainfall is 34 inches. The navigation of Lake Erie usually opens about the middle of April and closes early in December. Besides the Erie and the Welland Canals, the lake has two other great canal systems on its south shore,—the Ohio and Erie Canal, from Cleveland to Portsmouth, and the Miami and Erie Canal, from Toledo to Cincinnati.

Buffalo (population, 171,500 in 1883) is situated at the north-east angle of Lake Erie, and is therefore much exposed to the violence of south-west winds, in which direction the lake has a "fetch" of 200 miles. Thus more than ordinary care has been taken to provide safe harbour accommodation for the large fleets of vessels constantly arriving at Buffalo from the upper lakes. The Buffalo river, which has been made navigable for more than a mile, is protected at its mouth by a breakwater, 4000 feet long, built at about half a mile from the shore. The harbour thus formed allows of the entrance of vessels of 17 feet draught as against 13 in 1853. Not only is the port situated at the head of the Erie Canal and within an hour's sail of the Welland Canal, but it is the western terminus of the New York Central, Erie, and several other railways. The possession of these exceptional advantages has constituted Buffalo the great commercial centre of the inland seas of North America. For the six years ending 1883 the yearly average shipments of wheat and corn received by lake at Buffalo, by the Erie

Canal, and by rail from elevators was 5,555,000 quarters by canal and 2,320,000 by rail, or 70·20 and 29·80 per cent. respectively. There are 38 elevators in the city, comprising storage, transfer, and floating elevators, with a combined storage capacity of 1,125,000 quarters and a daily transfer capacity of 333,000 quarters. During the ten years ending 1883 the annual average number of lake vessels arriving and departing from Buffalo Creek numbered 7438, the aggregate tonnage was 4,165,098 tons, and the average size of craft 560 tons.

In 1883 the enrolled tonnage of the United States vessels for the northern lakes, and the enrolled registered tonnage of steam and sailing vessels in the province of Ontario, including tugs and barges on the Ottawa river and barges at Kingston, were as follows (Table II.):—

	United States.		Canada.	
	No.	Aggregate Tonnage.	No.	Aggregate Tonnage.
Sailing vessels	1873	310,454	452	44,000
Steam vessels	1149	304,649	352	64,000
	2522	615,103	804	108,000

Freight propellers are now rapidly doing away with sailing vessels, or causing them to be converted into barges or consorts. The rapid increase in their tonnage capacity has been remarkable. In 1841 there was only 1 freight propeller with a tonnage of 128 tons; in 1850 there were 50 with an average of 215 tons, in 1860 there were 197 with an average of 340 tons, and in 1880 there were 202 with an average of 689 tons.

The Erie Canal connects Lake Erie with the Hudson river at Erie Troy and Albany and with Lake Ontario at Oswego. The movement of freight of all kinds by the canal was 3,602,535 tons in 1873, and 3,587,102 in 1883, and the average annual movement from 1874 to 1883 was 3,447,464 tons. This canal was constructed in 1825 by the State of New York, for the passage of vessels of 60 tons; but by the year 1862 it was sufficiently enlarged to allow of the passage of vessels of 240 tons. The dimensions and capacity of the canal and its two principal feeders are given in Table III.:—

Locality.	Length in Miles.	Size of Canal.			No. & Size of Locks.		
		Width on Surface.	Width on Bottom.	Depth of Water.	No. of Locks.	Length.	Width.
Buffalo to Albany	351	Feet. 70	Feet. 56	Feet. 7	72	Feet. 110	Feet. 18
Oswego to Syracuse ..	38	70	56	7	18	110	18
Lake Champlain to Albany	66	50	35	5	20	100	18
Albany to New York by the Hudson river	455 145						

The cost of construction, maintenance, and management of the 455 miles of canal up to 30th September 1873 amounted to £17,460,000. A project has for some time been under serious consideration for the enlargement of one tier of the present locks and the deepening of the canal so that between Buffalo and Albany there would nowhere be a less depth than 8 feet. The estimated cost of this work is about £1,600,000.

The Welland Canal flanks the Niagara river and is 27 miles in Welland length from Port Colborne on Lake Erie to Port Dalhousie on Lake Ontario.

It was opened in 1833 for the navigation of small vessels and was first enlarged in 1844. Vessels, however, continued to increase in size until in 1860 there were 341 with an aggregate tonnage of 143,918 tons which were unable to pass through the enlarged canal. In 1870 the number that could not pass had increased to 384, with an aggregate tonnage of 194,685 tons; in 1880 to 460, with an aggregate tonnage of 287,842 tons; and in 1883 (notwithstanding the completion of the second enlargement in 1882) to 557, with an aggregate tonnage of 398,808 tons. The cost of the canal including its maintenance up to 30th June 1883 was \$20,859,605. Its dimensions are now as follows:—number of lift locks, 25; dimensions, 270 by 45 feet; total rise of lockage, 326½ feet; depth of water on sills, 12 feet. The movement of freight of all kinds by the canal was 1,330,629 tons in 1873 and 827,196 in 1883, and the average annual movement for the decade ending 1883 was 986,441 tons. This serious falling off in traffic is partly due to the numerous competitors by lake and rail which have sprung up during the last ten years for the transportation of products to the east, but principally to the deepening of the channels and harbours of the upper lakes, a work that has encouraged the construction of

a class of vessels that cannot make use of the Welland Canal even after its last enlargement. In order to meet this strong competition the Government of the Dominion of Canada was called upon still further to deepen the canal so as to allow the passage of the largest existing lake vessels without lightering; and in 1886 contracts were concluded for deepening it to 14 feet.

River Niagara. The Niagara river flows from Lake Erie to Lake Ontario in a northerly direction. Its width between Buffalo and Fort Erie (the site of the international iron-trussed railway bridge; see sketch map of Niagara river in vol. xvii. p. 472) is 1900 feet and its greatest depth 48. At this point the normal current is $5\frac{1}{2}$ miles an hour,—the extreme variation in the level of the river when uninfluenced by the wind being only 2 feet. During south-west gales, however, the water occasionally rises as much as 4 feet in a few hours, and at such times the current attains a maximum velocity of 12 miles an hour. Two miles below the bridge the river is divided into two arms by Grand Island, at the foot of which they reunite and spread over a width of 2 or 3 miles. The river then becomes studded with islands, until about 16 miles from Lake Erie, after a total fall of 20 feet, it narrows again and begins to descend with great velocity. This is the commencement of the rapids, which continue for about a mile with a total descent of 52 feet. The rapids terminate in the great cataract of Niagara, the fall of which on the American side is 164 feet and on the Canadian side 150 feet. The falls are divided by Goat Island, which rises 40 feet above the water and extends to the very verge of the precipice, where the total width of the river, including the island, is 4750 feet. The Horse-Shoe Fall on the Canadian shore is 2000 feet long, and the depth of water on the crest of the fall is about 20 feet. The American fall is only one-half that length, and discharges less than one-fourth the volume of the Horse-Shoe Fall. United, they discharge nearly 400,000 cubic feet per second or 41,000,000 tons per hour. The upper layer of the escarpment down which this enormous mass of water leaps consists of hard limestone about 90 feet thick, beneath which lie soft shales of equal thickness, which are continually being undermined by the action of the spray, driven violently by gusts of wind against the base of the precipice. In consequence of this action and that of the frost, portions of the incumbent rock overhang 40 feet, and often, when unsupported, tumble down, so that the falls do not remain absolutely stationary in the same spot. Sir C. Lyell in 1842 came to the conclusion that the cataract was receding at an average rate of 1 foot annually, "in which case it would have required 35,000 years for the retreat of the falls from the escarpment at Queenstown to their present site." From the foot of the falls to Queenstown, a distance of about 7 miles, the river descends 104 feet through a gorge from 200 to 300 feet deep and from 600 to 1200 feet wide. Midway in this deep defile the turbulent waters strike against the cliff on the Canadian side with great violence, and, being thus deflected from west to north, give rise to the dangerous eddy called the "Whirlpool." The escarpments end abruptly at Queenstown, where the waters suddenly expand to a great width, and finally, 7 miles farther on, tranquilly flow into Lake Ontario.

About one-third of a mile below the cataract a carriage-road suspension bridge (built in 1869 by Mr Samuel Keefer) spans the river with a single opening of 1190 feet, at a height of 190 feet above the water; and 2 miles lower down Roebling's celebrated railway and road suspension bridge (completed in 1855) crosses the river at a height of 245 feet above the water with a single span of 800 feet. In November 1883 a double-track railway three-span iron and steel cantilever bridge, situated about 100 yards above Roebling's bridge, was completed for the

New York Central and Michigan Central Railways. The total length of the bridge is 910 feet and that of the centre span 470 feet. The height from the water to the level of the rails is 239 feet.

Lake Ontario is the easternmost and smallest of the Lake great lakes of the St Lawrence system. Its basin drains 29,760 square miles, including the lake surface of 6700 square miles. The length of the lake is 190 miles, its greatest width 52 miles, its mean depth 412 feet, and its elevation above the sea 234 feet. It never freezes except near the shore. Its chief tributaries are the Trent on the north shore and the Genesee and the Oswego on the south shore, and its chief ports, Toronto, the capital of Ontario, 32 miles north of Port Dalhousie, at the foot of the Welland Canal; Oswego, at the south-east angle of the lake; and Kingston, at its north-east extremity, 52 miles north of Oswego.

Trent river navigation is a term applied to a series of reaches which do not, however, form a connected system of navigation, and which in their present condition are efficient only for local use. The series is composed of a chain of lakes and rivers extending from Trenton, at the mouth of the Trent on the Bay of Quinté, north shore of Lake Ontario, to Lake Huron. The new works (which will have locks 134 feet by 33 feet with a depth of 5 feet on sill) will give communication between Lakefield, $9\frac{1}{2}$ miles from Peterboro, and Balsam Lake, the headwaters of the system, opening up a total of about 150 miles of direct and lateral navigation.

The port of Oswego has been in direct communication with the Hudson river since 1822, by means of a canal of small capacity as far as Syracuse, and thence by the Erie Canal to Troy and Albany. It is now proposed by the United States Government to enlarge this route under the name of the Oneida Ship Canal, so that vessels arriving from the Welland Canal with cargoes of 50,000 bushels of wheat may be able to tranship them at Oswego into steam barges holding 25,000 bushels, or into barges to be towed with a capacity of 28,000 bushels. The length of the proposed route by the Oneida Lake and Durhamville is 200 miles, with a lockage of 609 feet; and its estimated cost, including 20 ascending and 47 descending locks (each 170 by 28 by $8\frac{1}{2}$ feet), is \$25,213,857. The Government of the Dominion of Canada has also under consideration the following projects to connect the St Lawrence with Lake Huron:—(1) the Ottawa and Georgian Bay Canal, from Montreal, by the Ottawa and Lake Nipissing, to French river; (2) the Toronto and Georgian Bay Canal, by way of Lake Simcoe; (3) the Hur-Ontario Canal, from Hamilton to Lake Huron, near Port Franks.

Kingston, being the port of transhipment for Montreal ^{Kingston} of three-fourths of the grain that arrives from the upper ^{to Mont-} lakes, is a place of some commercial importance. Formerly ^{real.} lake vessels were sent from Chicago to Montreal through the St Lawrence canals without breaking bulk. But it was afterwards found cheaper to transfer grain at Kingston, and to send it down the St Lawrence in barges, the cost of such transfer being only half a cent per bushel. Kingston is also at the south terminus of the Rideau Canal, which connects it with the city of Ottawa.

This canal, 126 miles long, has 33 locks ascending 292 feet and 14 descending 165, and admits vessels 180 by 30 feet drawing $4\frac{1}{2}$ feet of water. It was constructed in 1826-32 by the British Government at a cost of about \$4,000,000, chiefly with a view to the defence of the province, but since the opening of the St Lawrence canals it has become of comparatively little importance as a means of transport,—the distance from Montreal to Kingston being 68 miles longer by the Rideau and Ottawa Canals than by the St Lawrence.

Almost immediately after leaving Kingston that part of the St Lawrence commences which is called the Lake of a Thousand Islands. In reality they number 1692, and extend for 40 miles below Lake Ontario. At this point the Laurentian rocks break through the Silurian, and reach across the St Lawrence, in this belt of islands, to unite with the Laurentian Adirondack region in the State of New York. Near Prescott, a town on the Canadian side about 60 miles below Kingston, begins the chain of the St Lawrence canals proper, which were constructed to overcome a total rise of $206\frac{1}{2}$ feet,—the number of locks being 27 and the total length of the six canals $43\frac{1}{2}$ miles.

The canals are called, in the order of their descent, the "Galops," "Rapid Plat," and "Farran's Point," with an aggregate length of

12½ miles (the three forming with their intervening 15 miles of river navigation what is called the Williamsburg Canals), the "Cornwall," 11½ miles long, the "Beauharnois," connecting Lakes St Louis and St Francis, 11½ miles long, and the "Lachine," 8½ miles long. The locks of the first five canals, constructed in 1845-48, are 200 feet in length, with a depth of from 7 to 10 feet on their sills at exceptionally low water, and, with the exception of the "Galops" and "Cornwall," which are 55 feet wide, their width is 45 feet. The Lachine Canal was begun in 1821 and completed in 1824 for the navigation of vessels drawing 4½ feet, but it was not until 1843-48 that it was widened and deepened to the dimensions of the upper canals. It has lately been still further enlarged, and is already provided with locks 270 by 40 feet, with an available depth of 14 feet. The canal was closed on 1st December 1882 and opened on 1st May 1883,—the navigation having been interrupted as usual by the ice for a period of five months. The cost to the provincial and Dominion Government of the six canals, including their maintenance to 30th June 1883, was \$14,454,508. The five upper canals are now being enlarged to the dimensions of the improved Lachine Canal.

Near Cornwall, on the left bank, 50 miles below Prescott, the intersection of the parallel of 45° determines the point where the St Lawrence and its lakes (Lake Michigan excepted), having been an international boundary from the head of Lake Superior, become exclusively Canadian. Immediately below Cornwall the river flows through Lake St Francis, which has a length of about 30 miles and a width varying from 2 to 5 miles. In the long reach of the river below the lake it has been calculated by the Canadian canal commissioners that the mean volume of water discharged is 510,000 cubic feet per second. Ten miles below the foot of Lake St Francis, near the head of the island of Montreal, the river flows into Lake St Louis, which receives the main body of the Ottawa river, a small fraction of whose waters is delivered into the St Lawrence at the foot of the island 35 miles lower down the stream.

Ottawa river. The Ottawa river, which is 600 miles long, drains 60,000 square miles, and contributes a volume of 90,000 cubic feet per second to the St Lawrence, of which it is the largest tributary. Between Lake St Louis and the city of Ottawa, the capital of the Dominion, and perhaps the largest market for lumber in the world, the St Anne's lock (23½ miles from Montreal), Carillon Canal, Chute-à-Blondeau Canal, and the Grenville Canal (63½ miles from Montreal) have been constructed, and are now enlarged to 200 by 45 feet, with a depth of 9 feet on their sills, except the Chute-à-Blondeau Canal, whose single lock has still its original dimensions of 130 by 32 feet with only 6 feet on its sill. The total lockage between the Lachine Canal and Kingston by the Rideau Canal (the entrance to which is 119½ miles from Montreal) is 509 feet (345 rise, 164 fall) and the number of locks is 55. On the upper Ottawa—the Culbute Canal and L'Islet rapids—there are two locks 200 feet long, 45 wide, and 6 deep, with a lift of 18 to 20 feet. The cost of the Ottawa canals, including the Rideau Canal, to 30th June 1883 was \$9,126,125.

Montreal. After leaving Lake St Louis the St Lawrence dashes wildly down the Lachine rapids, a descent of 42 feet in 2 miles, and 8 miles farther on, after passing beneath the 25 spans of the Victoria Tubular Railway Bridge, which has a length of 9144 feet, reaches the quays of Montreal, 198 miles below Kingston. In the beginning of the present century vessels of over 300 tons burden were unable to reach the city, but by deepening Lake St Peter and the shoals in the St Lawrence between Quebec and Montreal the latter has been made accessible to vessels of 4000 tons burden and drawing 25 feet of water. Work is being steadily continued and will not cease until a depth of 27½ feet is attained, so as to enable the largest vessels afloat to reach the long stretch of new deep-water quays. In 1883 the tonnage of the 660 sea-going vessels which visited

the port was 664,263 tons, of which 605,805 belonged to 264 steamships, so that only 9 per cent. of the freight arriving from sea was carried in sailing vessels. The St Lawrence has an average width of 1½ miles for 46 miles from Montreal down to Sorel on the right bank, at which point it is joined by the Richelieu river, a tributary that drains 9000 square miles.

The Richelieu river is made navigable from its mouth to Lake Richelieu Champlain, a distance of 81 miles to the United States boundary, river and by a dam and lock at St Ours, half a mile long (14 miles above canal. Sorel), and a canal of 12 miles in length 32 miles farther up the river, known as the Chambly Canal. These give a navigable depth of 7 feet, allowing vessels 114 feet long, 23 broad, and drawing 6½ feet of water, to pass through the canal from end to end. The cost of the works to 30th June 1867 was \$756,249. The total length of navigation between Montreal and New York by the Richelieu Canal, Lake Champlain, the Champlain and Erie Canal, Albany, and the Hudson river is 456 miles. The Richelieu Canal, which already carries a freight of 350,000 tons annually, is to be enlarged, and a canal is to be constructed from Lake St Louis at Chaughnawaga, above Lachine, to St Johns on the Richelieu river, in connexion with the Chambly Canal, to connect the St Lawrence with Lake Champlain by a new channel, which it is proposed should have the same dimensions as the improved Welland Canal. The cost of the proposed Chaughnawaga Canal, which would have a length of 32 miles and a lockage of only 29 feet, is estimated at \$5,500,000.

Immediately below Sorel the river flows into Lake St Peter, 20 miles in length by 9 in width, through which Quebec. prior to 1851 no vessel drawing more than 11 feet could pass. Since then a cutting 300 feet wide has been dredged to a depth of 25 feet. At Three Rivers, 86 miles below Montreal, the St Lawrence first meets the tide and receives from the north the waters from the St Maurice, which drains about 16,000 square miles. Nearing Quebec, the river, which maintains an average width of 1½ miles from Lake St Peter, narrows into a width of three-quarters of a mile at Cape Diamond, on the left bank, 160 miles below Montreal. The depth here is 128 feet and the rise of spring tides 18 feet.

The lower town of Quebec, which has extensive harbour accommodation, is built on reclaimed land around the base of the cape, one of its sides being washed by the river St Charles, which here flows into the St Lawrence. At the mouth of the St Charles the Princess Louise embankment, 4000 feet long by 300 wide, encloses a tidal area of 20 acres, having 24 feet of depth at low water. Connected with it is a wet dock, which is to have a permanent depth of 27 feet with an area of 40 acres. On the opposite side, at Pointe Levis, the Lorne graving-dock is nearly completed. Its dimensions are 500 feet in length, 100 in width, and 25½ feet depth of water on its sill. During the year ending June 1884 the departures for sea of vessels from Quebec were 698, with an aggregate burthen of 686,790 tons.

The Canadian Government have sanctioned the proposal to construct a railway bridge across the St Lawrence within a few miles of Quebec, at a point where the river narrows to a width of 2400 feet at high water. The area of the waterway at high water is 200,000 square feet and at low water 160,000. For a width of about 1400 feet in the centre of the channel the water shelves rapidly from either shore into deep water, until it attains a maximum depth of nearly 200 feet. The proposed bridge, as designed by Messrs Brunlees, Light, & Claxton Fidler, will consist of three principal spans, entirely of steel, resting on masonry piers founded on the rock. The central span will have a clear width of 1442 feet, the underside of the superstructure being 150 feet above high water.

Seven miles below Quebec the St Lawrence is 4 miles Below wide and divides into two channels at the head of the Quebec. Island of Orleans, nearly opposite which, on the north shore, are the celebrated falls of Montmorency, with a perpendicular descent of 240 feet and a width of 50 feet. At the foot of the island, which is 22 miles long, the river expands to a width of 11 miles. This width increases to 16 miles 90 miles farther on, at the mouth of the river Saguenay, which drains an area of 23,716 square miles.

About 260 miles below Quebec, between Pointe des Monts on the north and Cape Chat on the south, the St Lawrence has a width of 30 miles, and, as this expanse is doubled 30 miles farther seaward, Cape Chat has been considered by many geographers as the southern extremity of an imaginary line of demarcation between the St Lawrence river and the gulf of the same name. It may, however, be assumed, with more propriety perhaps, taking the configuration of the gulf into special account, that Cape Gaspé, about 400 miles below Quebec and 430 miles from the Atlantic at the east end of the Straits of Belle Isle, is the true mouth of the St Lawrence river.

It has been calculated by Darby, the American hydrographer, that the mean discharge from the St Lawrence river and gulf, from an area rather largely estimated at 565,000 square miles, must be upwards of 1,000,000 cubic feet per second, taking into account the mean discharge at Niagara, which is 389,000 cubic feet per second from a drainage area of 237,000 square miles, and bearing in mind the well-ascertained fact that the tributaries of the lower St Lawrence, coming from mountainous woody regions where snow falls from 4 to 8 feet in depth, deliver more water per square mile than its upper tributaries.

The great prosperity and growth of Canada are owing no doubt to its unrivalled system of intercommunication by canal and river with the vast territories through which the St Lawrence finds its way from the far-off regions of the Minnesota to the seaboard. This great auxiliary of the railways (by means of which trade is now carried on at all seasons) must therefore be prominently taken into account in considering the transport routes of the future, their chief use being, as far as the conveyance of traffic over long distances is concerned, to augment, in the shape of feeders, the trade of the river, as long as it keeps open, and when it closes to continue the circulation of commerce by sledges until the ice breaks up and restores the river to its former activity. By the published statistics of the harbour commissioners of Montreal it appears that during the ten years 1870-79 the opening of the navigation at Montreal varied between 30th March and 1st May, and the close of the navigation between 26th November and 2d January, and that, whilst the first arrival from sea varied from 20th April to 11th May, the last departure to sea only varied from 21st November to 29th November during the ten years. (C. A. H.)

According to the chief geographer of the United States Geological Survey, the following were the principal data for the St Lawrence lakes in 1886. Area of basin of St Lawrence 457,000 square miles, of which 380,000 belong to Canada and 127,000 to the United States. *Lake Superior*—area 31,200 square miles, length 412 miles, maximum breadth 167 miles, maximum depth 1008 feet, altitude above sea-level 602 feet. *Lake Huron*—area 21,000 square miles, 263 miles long, 101 broad, maximum depth 702 feet, altitude 581 feet. *Lake Michigan*—area 22,450 square miles, maximum breadth 84 miles, length 345 miles, maximum depth 870 feet, altitude 581 feet. *Lake St Clair*—29 miles long. *Lake Erie*—area 9960 square miles, length 250 miles, maximum breadth 60 miles, maximum depth 210 feet, height above sea-level 573 feet and above Lake Ontario 326 feet. *Lake Ontario*—area 7240 square miles, length 190 miles, breadth 54 miles, maximum depth 738 feet, elevation 247 feet. In 1885 the enrolled vessels on the St Lawrence lakes belonging to the United States numbered 2497 (steam 1175, sailing 1322) with an aggregate burthen of 648,988 tons (steam 335,859 tons, sailing 313,129 tons).

ST LEONARDS is the name given to the western and more modern part of HASTINGS (*q.v.*), a watering-place on the coast of Sussex, England. St Leonards proper, which formed only a small part of the district now included under that name, was at one time a separate township. The population of St Leonards in 1881 was 7165.

ST LEONARDS, EDWARD BURTENSHAW SUGDEN, LORD (1781-1875), lord chancellor of England, was the son of a hairdresser in Duke Street, Westminster, and was born in

February 1781. After practising for some years as a conveyancer, he was called to the bar at Lincoln's Inn in 1807, having already published his well-known treatise on the *Law of Vendors and Purchasers*. In 1822 he was made king's counsel and chosen a bencher of Lincoln's Inn. He was returned at different times for various boroughs to the House of Commons, where he made himself prominent by his opposition to the Reform Bill of 1832. He was appointed solicitor-general in 1829, was named lord chancellor of Ireland in 1834, and again filled the same office from 1841 to 1846. Under Lord Derby's first administration in 1852 he became lord chancellor and was raised to the peerage as Lord St Leonards. In this position he devoted himself with energy and vigour to the reform of the law; Lord Derby on his return to power in 1858 again offered him the same office, which from considerations of health he declined. He continued, however, to take an active interest especially in the legal matters that came before the House of Lords, and bestowed his particular attention on the reform of the law of property. He died at Boyle Farm, Thames Ditton, 29th January 1875.

Lord St Leonards was the author of various important legal publications, many of which have passed through several editions. Besides the treatise on purchasers already mentioned, they include *Powers, Cases decided by the House of Lords, Gilbert on Uses, New Real Property Laws*, and *Handybook of Property Law*.

ST LÔ, a town of France, chef-lieu of the department of Manche, on the right bank of the Vire, 195 miles west by north of Paris by the railway which here breaks up into two branches for Coutances and Vire respectively. The old town stands on a rocky hill (110 feet high) commanding the river; the modern town spreads out below. Notre Dame is a Gothic building of the 14th century, with portal and two towers of the 15th. In the town-house is the Torigny marble, commemorating the assemblies held in Gaul under the Romans and now serving as a pedestal for the bust of Leverrier the astronomer, who was born at St Lô. The museum has some good pictures, and in the abbey of St Croix there are windows of the 14th century. The Champs de Mars is a fine tree-planted place. Horse-breeding, cloth and calico weaving, wool-spinning, currying and tanning, are the local industries. The population in 1881 was 9889 (10,121 in the commune).

St Lô, founded in the Gallo-Roman period, was originally called Briovira (bridge on the Vire), and afterwards St Étienne, the present name being from one of its bishops (Lo, Laudus), who lived in the 6th century. By the time of Charlemagne the town was already surrounded with walls and contained the abbey, which was sacked by the Normans. In 1141 it fell into the hands of Geoffrey Plantagenet. But in 1203 the castle opened its gates to Philip Augustus, and, weaving being introduced, St Lô soon became a flourishing industrial centre. In the middle of the 14th century Edward III. of England captured the town and according to Froissart obtained immense booty. It was again taken by the English in 1417, but the victory of Formigny (1450) restored it permanently to France. The hearty welcome it gave to the Reformation brought upon St Lô new disasters and new sieges. The revocation of the Edict of Nantes led to the emigration of a part of the inhabitants. In 1800 the town was made the centre of the department, but by Napoleon's orders it was deprived of its fortifications.

ST LOUIS, the capital of Senegambia or Senegal, West Africa, and known to the natives as far as Timbuktu as N'dar, is built on an island 10 sea-miles above the mouth of the Senegal river, near the right bank, which is there a narrow strip of sand—the Langue de Barbarie—occupied by the villages of N'dar Toute and Guet N'dar. Two bridges on piles connect the town with the villages; and the Pont Faidherbe, 2132 feet long and constructed in 1863, affords communication with Bouetville, a suburb and the terminus of the railway, on the left bank. The houses of the European portion of St Louis have for the most part flat roofs, balconies, and terraces. Besides the governor's residence the most prominent buildings are the cathedral, the great mosque, the court-house, and the

various barracks and offices connected with the army. The town also contains the Senegal bank (1855), a Government printing-office (1855), a chamber of commerce (1869), a public library, and an agricultural society (1874). The round beehive huts of Guet N'dar are mainly inhabited by native fishermen. N'dar Toute consists of villas with gardens, and is frequented as a summer watering-place. There is a pleasant public garden in the town, and the neighbourhood is rendered attractive by alleys of date-palms. As there are no natural wells on the island, and the artesian well at the north side of the town gives only brackish water, St Louis used to be dependent on rain-tanks and the river (and except during the rainy season the water in the lower part of the river is salt); but in 1879 1,600,000 francs were appropriated to the construction of a reservoir at a height of 300 feet above the sea, $7\frac{1}{2}$ miles from the town. The mouth of the Senegal being closed by a bar of sand with extremely shifting entrances for small vessels, the steamships of the great European lines do not come up to St Louis, and passengers, in order to meet them, are obliged to proceed by rail to Dakar, on the other side of Cape Verd. Ordinary vessels have often to wait outside or inside the bar for days or weeks and partial unloading is often necessary. It is proposed to construct a pier opposite Guet N'dar. The population of St Louis was 15,980 in 1876 and 18,924 in 1883. Though founded in 1662, the town did not receive a municipal government till August 1872. See SENEGAL.

ST LOUIS, a city of the United States, chief city of the State of Missouri, is situated on the west bank of the Mississippi river, 20 miles below its confluence with the Missouri river and 200 miles above the influx of the Ohio, in $38^{\circ} 38' 3'' 6''$ N. lat. and $90^{\circ} 12' 17''$ W. long. It is distant by river about 1200 miles from New Orleans, and 729 from St Paul at the head of navigation on the Mississippi, and occupies a position near the centre of the great basin through which the mingled flood of the Mississippi and Missouri and their extensive system of tributaries is carried to the Gulf of Mexico. The site embraces a series of undulations extending westwards with a general direction nearly parallel to the river, which at this point makes a wide curve to the east. The extreme length in a straight line is 17 miles, the greatest width 6.60 miles, the length of river front 19.15 miles, and the area (including considerable territory at present suburban in character) $62\frac{1}{2}$ square miles. The elevation of the city directrix above the waters of the Gulf of Mexico is 428 feet, that of the highest point of ground in the city above the directrix is 203 feet; the extreme high-water mark above the directrix is 7 feet 7 inches, and the extreme low-water mark below the same is 33 feet $9\frac{3}{4}$ inches. The elevated site of the city prevents any serious interruption of business by high water, even in seasons of unusual floods.

The plan of the city is rectilinear, the ground being laid out in blocks about 300 feet square, with the general direction of street lines north-south and east-west. The wharf or river front is known as the Levee or Front Street, the next street west is Main Street, and the next Second, and thence the streets going north-south are, with few exceptions, in numerical order (Third, Fourth, &c.). Fifth Street has recently been named Broadway. The east-west streets bear regular names (Chestnut, Pine, Washington, Franklin, and the like). Market Street is regarded as the middle of the city, and the numbering on the intersecting streets commences at that line, north and south respectively. One hundred house numbers are allotted to each block, and the blocks follow in numerical order. The total length of paved streets in St Louis is 316 miles, of unpaved streets and roads 427, total 743 miles. In the central streets, subject to heavy traffic, the pavement is of granite blocks;

wood, asphalt, and limestone blocks and Telford pavements are also used. There are nearly 300 miles of mac-

adamized streets, including the roadways in the new limits. The length of paved alleys is about 66 miles. The city has an extensive sewer system (total length 223 miles), and, owing to the elevation of the residence and business districts above the river, the drainage is admirable. The largest sewer, Mill Creek (20 feet wide and 15 feet high), runs through the middle of the city, from west to east, following the course of a stream that existed in earlier days. The water-supply is derived from the Mississippi; the water is pumped into settling basins at Bissell's Point, and thence into the distributing pipes, the surplus flowing to the storage reservoir on Compton Hill, which has a capacity of 60,000,000 gallons. The length of water-pipe is nearly 250 miles; the capacity of the low-service engines which pump the water into the settling basins is 56,000,000 gallons in twenty-four hours, and that of the high-service engines which supply the distributing system 70,000,000 gallons. The average daily consumption in twenty-four hours is nearly 28,000,000 gallons. The works, which are owned by the city, cost over \$6,000,000. Among the more

important public buildings are the new custom-house and post-office, erected at a cost of over \$5,000,000; the merchants' exchange, which contains a grand hall 221 feet 10 inches in length by 62 feet 10 inches in width and 60 feet in height; the court-house, where the civil courts hold their sessions; the four courts and jail, in which building are the headquarters of the police department and the chambers of the criminal courts; the cotton exchange; the new exposition and music-hall building on Olive Street, erected by public subscription; and the Crow Museum of Fine Arts. The present city-hall is a large but hardly ornamental edifice. The mercantile library, on Fifth and Locust Streets, contains nearly 65,000 volumes and also a valuable art collection. The public school library in the polytechnic building has about 55,000 volumes. There are six handsome theatres and various other smaller places of amusement. The public school system of St Louis includes the kindergarten (for which St Louis has become somewhat celebrated), the grammar-schools (including eight grades, of a year each), and a high school, besides the normal school and a school for deaf mutes. The public schools naturally absorb much the largest number of pupils; but the parochial schools and the private schools gathered about the Washington university are also much frequented. The number of pupils in 1883-84 was in the normal school 64, high school 783, grammar-schools 52,280, total in day schools 53,127; total in day and evening schools 56,366. The total number of public school buildings is 104, and the value of property used for school purposes \$3,229,148; all the school edifices are substantial and convenient, and many architecturally attractive. The receipts of the public school system for 1884 were \$941,332, and the total expenditure \$934,609, the amount paid to teachers being \$632,873. Of parochial schools there are about 75. The Washington and St Louis universities are old and well-established institutions. There are also the Mary Institute and the manual training school, both connected with Washington university, the college of the Christian Brothers, convent seminaries, and numerous medical colleges. In addition there are art schools, singing and gymnastic societies, and other similar organizations and establishments. There are published in St Louis four daily newspapers in English and four in German, and also a number of weekly publications.

There are 16 Baptist churches, 8 Congregational, 13 Episcopal, 25 German Evangelical and Lutheran, 6 Hebrew congregations, 18 Methodist Episcopal, 8 Methodist Episcopal Church (South), 25 Presbyterian, 45 Roman Catholic, and 3 Unitarian. Many of the buildings are of imposing proportions, built of stone, massive in character, and with lofty spires. The Roman Catholic cathedral, built in 1830, is the oldest church now in use. On the high ground in the central-western portion of the city (Stoddard's Addition) will be found most of the costly church buildings, whilst in the northern and southern portions of the city there are very few indeed.

The parks and squares of St Louis number 19, covering nearly 2100 acres. Tower Grove Park, in the south-western suburbs, containing about 266 acres, was presented by Mr Henry Shaw. The smaller parks are situated to the east of Grand Avenue, and the driving parks in the suburbs, — O'Fallon Park (158 acres) at the northern extremity of the city, Forest Park (1372 acres) west of the central portion, Tower Grove in the south-west, and Carondelet (180 acres) in the south. In the immediate vicinity of Tower Grove Park are the Missouri Botanical Gardens, established by Mr Henry Shaw, and containing the most extensive botanical collection in the United States. In addition to the parks, the Fair Grounds in the north-west should be mentioned, where the annual fair is held, and

where there is a permanent zoological department. An amphitheatre, capable of seating between 20,000 and 30,000 spectators, and a race-course with a most elaborate grand stand, are among the other features. There are various beer-gardens in the city, largely frequented as pleasure-resorts. There are about 120 miles of street railways in operation.

The following table shows the population of St Louis at different periods :—

1799.....	925	1856	125,200
1810.....	1,400	1866	204,327
1820.....	4,928	1870 (United States	
1830.....	5,862	census)	310,864
1840.....	16,469	1880	350,518
1850.....	74,439		

The figures of the United States census are strictly confined to municipal limits, and do not include the residents of East St Louis and of various suburban localities, properly a part of the city population. In 1880 the population (179,520 males, 170,998 females) was divided as follows :—native, 245,505; foreign-born, 105,013. Of the latter 36,309 came from Great Britain (28,536 Irish) and 54,901 from Germany. The death-rate per thousand in 1882 was 19·6, in 1883 it was 20·4, and in 1885 (population being estimated at 400,000) it was 19·7.

The police force, including detectives and employés, numbers about 500 men. The fire brigade numbers 250 men, with 22 engine-houses. The city has three public hospitals, an asylum for the insane, a poorhouse, a workhouse for the confinement and employment of prisoners charged with petty offences, and a house of refuge which is a reformatory institution for juvenile offenders and for the education of children thrown upon the care of the city by abandonment or otherwise. The number of asylums, hospitals, and other institutions supported by private charity is very large.

Government and Finance.—St Louis is not included in any county of the State, but exists as a separate municipality. It was formerly embraced in St Louis county, and was within the jurisdiction and taxing power of a city and county government. The State constitution was revised in 1875 and two years later the separation of the city and the county government was effected, the former being reorganized under the present charter. The city levies and collects municipal and State revenues within its limits, and manages its own affairs, free from all outside control, except that of the legislature of the State. The voters of the city have the right to amend the charter at intervals of two years at a general or special election, —provided the proposed amendments have been duly sanctioned

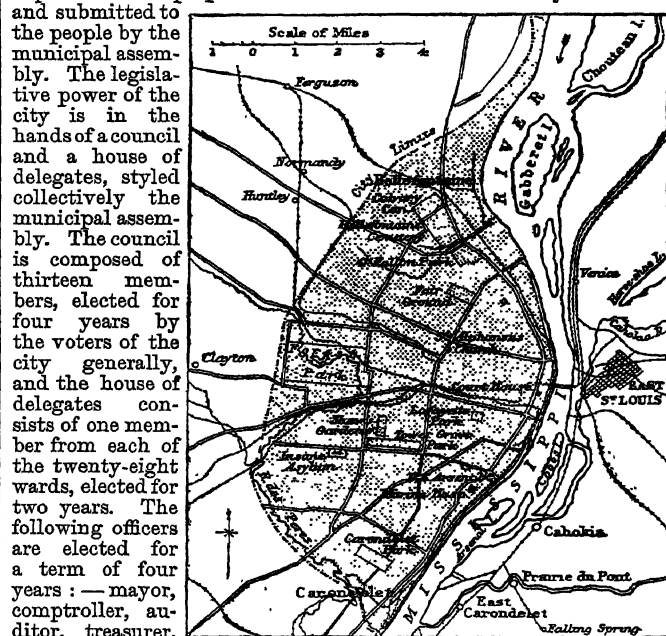

FIG. 2.—St Louis and environs.

of deeds, inspector of weights and measures, sheriff, coroner, marshal, public administrator, president of the board of assessors, and pre-

sident of the board of public improvements. The elective officers, including the members of the board of public improvements, are nominated by the mayor and approved by the council, and the appointments are made at the beginning of the third year of the mayor's term, so as to remove the distribution of municipal patronage from the influences of a general city election. The power of the mayor and council touching appointments to office and removals is subject to certain reciprocal checks.

The bonded debt of St Louis at the close of the fiscal year, 13th April 1885, was \$22,016,000. This debt is reduced each year by the operation of the sinking fund. The city has no floating debt. The receipts for the fiscal year ending 13th April 1885, deducting proceeds of revenue bonds and special deposits, were \$5,659,086, or with balance in treasury at opening of year \$6,514,877. The total expenditure was \$5,681,557. The city tax rate for the year 1884 was \$1.75 on the \$100. During the last few years the rate of interest on the bonded debt has been reduced from 6 and 7 per cent. to 5 per cent., and more recently to 4 per cent. Most of the outstanding bonds are held in England and Germany. All appropriations are rigidly limited to the available means, and the increase of the bonded debt is forbidden by law. In 1860 the taxable valuation was \$69,846,845, in 1870 it was \$147,969,660, in 1880 \$160,493,000, and in 1885 \$207,910,350.

Commerce.—Subjoined are a few of the more important facts and figures respecting the commerce of St Louis. In 1884 there were 6,440,787 tons of freight received by rail and 520,350 by river, making a total of 6,961,137 tons. In the same year there were shipped by rail 3,611,419 tons and by river 514,910 tons (total 4,126,329). The total receipts of grain for 1884, including wheat reduced to flour, were 52,776,832 bushels, as against 51,983,494 bushels in the previous year. During 1884 the amount of flour manufactured was 1,960,737 barrels, and the amount that changed hands 4,757,079 barrels; 302,534 bales of cotton, 19,426 hogsheds of tobacco, and 118,484,220 lb of sugar were received; and 193,875,479 lb of pork in various forms were shipped. There are thirteen tobacco manufactories, with a production in 1884 of 22,631,104 lb. In live stock, lumber, hides, wool, salt, lead, and a long list of other commodities the business is large and increasing. Extensive stock-yards are established in the northern part of the city, and also in East St Louis, where they are known as the national stock-yards, and cover a space of over 600 acres. In 1884 there were imported—cattle, 450,717; sheep, 380,822; pigs, 1,474,475; horses and mules, 41,870. The shipments in the same year were—cattle, 315,433; sheep, 248,545; pigs, 678,874; horses and mules, 39,544. There are twelve grain elevators, with a total capacity for bulk grain of 10,950,000 bushels and 415,000 sacks. The coal received during the year amounted to 52,349,600 bushels. The foreign value of imports for the year was \$2,586,876, and the collections at the custom-house were \$1,463,495.

Among the more important manufactures may be mentioned those of iron and steel, glass, flour, sugar, beer, bagging, prepared foods, tobacco, boots and shoes, furniture, planed and sawed lumber, wire and wire-work, carriages and waggon, foundry and machine-shop products, hardware, agricultural implements, &c. Meat packing is also an important industry. The summary of manufactures in the United States census of 1880 shows 2924 establishments, having a capital of \$50,832,885; amount paid in wages during the year, \$17,743,532; value of materials, \$75,379,867; value of products, \$114,333,375. These figures ought probably to be largely increased now (1886). In the wholesale grocery trade St Louis is ahead of nearly all the inland cities of the Union. There are between twenty and thirty wholesale houses, and it is estimated that the annual sales exceed \$30,000,000. The Belcher sugar-refinery is able to turn out 1200 barrels a day. The capital employed in the wholesale and retail dry goods establishments is estimated at between \$10,000,000 and \$12,000,000, and the annual amount of business at \$35,000,000 to \$40,000,000. The brewing business of St Louis has had an astonishing development, and its product is shipped to all parts of the world. It employs over \$8,000,000 of capital, and pays out in wages over \$2,000,000 per annum. The ale and beer shipments during 1884 numbered 1,834,545 packages. The brick-making industry has recently become important, and the hard red brick for building and the fire brick produced in St Louis are among the best to be found in the United States. In 1884 there were eighteen State banks and six national banks representing—capital and surplus, \$14,742,123; savings and time deposits, \$9,102,021; current deposits, \$29,000,691; circulation, \$674,150; total, \$53,518,985. The clearings for 1884 amount to \$785,202,177, and the balances to \$125,260,945, making a total of \$910,463,122.

Railways.—St Louis is one of the most important railroad centres in the United States; the nineteen lines which run trains into the Union depôt represent nearly 20,000 miles of railway. The Union passenger depôt, contiguous to the business centre of the city, is connected with the bridge over the Mississippi by a tunnel. The buildings are of a temporary character, and are not adequate to the enormous business transacted; a new depôt of imposing proportions is now in contemplation. Over 150 passen-

ger trains arrive and depart daily. The tunnel already referred to commences a few hundred yards east of the Union depôt. It has double tracks throughout its length, which is about 1 mile, and is supplied with electric lights, ventilating shafts, and the best appliances for safety and convenience. It is leased by the Wabash, St Louis, and Pacific and the Missouri Pacific Railroad Companies, which are also the lessees of the bridge. The bridge across the Mississippi river at St Louis is one of the most remarkable structures in the world in character and magnitude. It consists of three arches, the two side spans being 502 feet in the clear and the centre span 520 feet, and carries a roadway for ordinary traffic 54 feet wide and below this two lines of rail. The dimensions of the abutments and piers are as follows:—

	Dimensions at foundation.		Dimensions at top.		Height from foundation to top of M.		Foundation below extreme low water.	
	Length.	Thickness.	Length.	Thickness.				
East abutment	ft.	ft. in.	ft. in.	ft. in.	ft. in.	ft. in.	ft. in.	ft. in.
East pier.....	32	70 6	64 3½	47 6	192 9	83 3½	83 3½	83 3½
West pier.....	32	60 0	63 0	24 0	197 1½	86 2½	86 2½	86 2½
West abutment	94	62 8½	64 3½	47 6	112 8½	18 8½	18 8½	18 8½

The foundations of abutments and piers rest on solid rock. The two piers and the east abutment were sunk by means of pneumatic caissons. The greatest depth below the surface at which work was done was 110 feet, the air-pressure in the caisson being 49 lb. Each arch consists of four equal ribs; each rib is composed of two circular members, 12 feet apart, which are connected by a single system of diagonal braces. The circular members consist of steel tubes, which are 12 feet long and 18 inches in diameter; each tube is composed of 6 steel staves, varying in thickness between 1½ and 2½ inches. These staves are held together by a steel envelope, a quarter of an inch thick. The tubes are joined together by couplings, and the end tubes are rigidly connected with wrought-iron skewbacks, which are fixed to the masonry by long bolts. The arches were erected without using any false work. Work on the bridge was commenced March 1868, and it was opened for traffic on 4th July 1874. The total cost of bridge and approaches was \$6,536,730. The traffic across the bridge is rapidly developing. In 1876 the gross earnings were \$448,447 (loaded waggons, 45,027; railway passengers, 496,686); in 1884 the gross earnings were \$1,520,483 (loaded waggons, 172,730; railway passengers, 1,333,360); a total of 2,225,994 tons was carried; and the total number of cars which crossed the bridge was 472,324.

History.—The first permanent settlement on the site of St Louis was made in February 1764, and was in the nature of a trading post, established by Pierre Laclede Liguist. Long prior to this event there had been some exploration of the vast regions of the Mississippi and its tributaries by Marquette, Joliet, La Salle, Hennepin, and others; but, although a few widely separated military and trading posts had been established, there was no accurate knowledge of the character and resources of the country. Laclede's expedition was nearly contemporaneous with the treaty of Paris, 1763, by which the title of France to the regions in the valley of the Mississippi was practically extinguished, Spain becoming owner of all Louisiana west of the Mississippi, and England of all territory east of that river, excepting New Orleans. The few French forts north of the Ohio were nominally surrendered to the English, including Vincennes, Cahokia, Kaskaskia, and Fort de Chartres; but there was no immediate formal assertion of English control, and French sentiments and manners and customs remained undisturbed. In 1771 St Louis was formally occupied by a small body of Spanish troops, commanded by Don Pedro Píernas, and a period of somewhat over thirty years of Spanish rule followed, during which few local events of noteworthy character occurred. On 25th May 1780—the festival of Corpus Christi—the post, or village, was attacked by Indians, and about thirty of the citizens were killed; but the savages were beaten off and did not renew the attack. In 1800 Spain ceded back to France all her territory of Louisiana, and three years later—30th April 1803—France ceded to the United States all her right, title, and interest in the territory for eighty million francs. At this time St Louis and the adjacent districts had a population of not over 3000, and the total population of Upper Louisiana was between 8000 and 9000, including 1300 Negroes. There were not over 200 houses in the embryo city, which consisted mainly of two streets parallel to the river. For fifty or sixty years after the landing of Laclede the progress of the town was necessarily slow. In 1810 the population was less than 1500, and in 1830 it had not reached 6000. From the latter date progress became steady and rapid, and the real growth of the city was compressed within half a century. An extensive conflagration occurred in 1849, which destroyed most of the business houses on the Levee and Main Street. During the Civil War the commercial advancement of St Louis was seriously retarded; but the city continued to expand in population owing to its advantageous geographical position. (D. H. M^rA.)

ST LUCIA, a West India island, discovered by Columbus in 1502, is situated in 13° 50' N. lat. and 60° 58' W. long., and has a length of 42 miles and a maximum breadth of 21. Pigeon Island, formerly an important military post, lies at its northern extremity. Originally inhabited by Caribs, St Lucia was settled by the English in 1639, and, after many alternations of English and French possession, surrendered to the British arms in 1794. Sir John Moore was governor till 1797. St Lucia was subsequently in French possession, but was finally restored to Great Britain in 1803. The scenery consists of mountain, valley, and forest; two cone-shaped rocks rise out of the sea to a height of 3000 feet, and near them are craters of extinct volcanoes and a solfatara. The island is considered a good coaling station for mail-steamers and war-ships; there is a good harbour on the west coast, below Castries, the capital (population, 5000). The total population was 40,532 in 1883, of whom 1000 were white, mostly French. St Lucia forms part of the general government of the Windward Islands (from which Barbados is excluded); it has a legislative council composed of officials and crown nominees. The annual revenue and expenditure were £43,026 and £36,652 respectively in 1883, the debt (principally for Central Sugar Factory) being £32,400. The tonnage of vessels entered and cleared was 438,688; the total imports were valued at £191,191 and the exports (sugar, 7600 tons; cocoa, 307,120 lb) at £213,823. The Usine or Central Factory system has been established with Government assistance.

ST MALO, a seaport town of France, on the English Channel, on the right bank of the estuary of the Rance, is situated in 48° 39' N. lat., 51 miles by rail north-north-west of Rennes. It is the administrative centre of an *arrondissement* in the department of Ille-et-Vilaine and a first-class garrison town, surrounded by ramparts of the 13th, 16th, and 17th centuries, which are strengthened with great towers at the principal gates. The granite island on which St Malo stands communicates with the mainland only on the north-east by a causeway known as the "Sillon" (furrow), 650 feet long, and at one time only 46 feet broad, though now three times that breadth. This causeway forms part of the site of Rocabey, an industrial suburb more extensive, though less populous, than the town itself. In the sea round about lie other granite rocks, which have been turned to account in the defences of the coast; on the islet of the Grand Bey is the tomb (1848) of Chateaubriand. The rocks and beach in the circuit of St Malo are continually changing their appearance, owing to the violence of the tides. Equinoctial spring-tides sometimes rise 50 feet above low-water level, and during storms the sea sometimes washes over the ramparts. The harbour of St Malo lies south of the town in the creek separating it from the neighbouring town of St Servan. It has a wet dock with from 20 to 25 feet of water (30 feet in spring-tides), and a mile of quays. Additional works are projected, to make the area of the dock 42 acres and the length of quays 1½ miles. Among French seaports St Malo stands twelfth in commercial importance, but first in the number of seamen on its register. The annual imports and exports together amount to 184,000 tons, and 3000 tons of shipping are built yearly. Besides fitting out fishing-boats for Newfoundland, St Malo exports grain, colza-seed, cider, butter, tobacco, and various kinds of provisions to the Channel Islands, with which it is connected by a regular steamboat service. The coasting vessels have a tonnage of about 30,000. Communication between St Malo and St Servan is maintained by a revolving bridge. St Malo is largely frequented for sea-bathing, but not so much as Dinard, on the opposite side of the Rance. Paramé, to the east of

St Malo, has recently sprung into importance. The interior of St Malo presents a tortuous maze of narrow streets and of small squares lined with high and sometimes quaint buildings. The old house in which Duguay-Trouin was born deserves to be noted. Above all rises the stone spire which since 1859 terminates the central tower of the cathedral. The castle, which defends the town towards the "Sillon," is flanked with four towers, and in the centre rises the great keep, an older and loftier structure, which was breached in 1378 by the duke of Lancaster. St Malo has statues to Chateaubriand and Duguay-Trouin. The museum contains remains of the ship "La Petite Hermine," in which Jacques Cartier sailed for the discovery of Canada; and the natural history museum possesses a remarkable collection of from 6000 to 7000 European birds. The population of St Malo in 1881 was 10,891 (commune, 11,212).

In the 6th century the granite island on which St Malo now stands was the retreat of Abbot Aaron, who gave asylum in his monastery to Malo (Maclovius or Malovius), a Cambrian priest, who came hither to escape the episcopal dignity, but afterwards became bishop of Aleth (now St Servan); the see was transferred to St Malo only in the 12th century. Jealous of their independence, the inhabitants of St Malo played off against each other the dukes of Brittany and the kings of France, who alternately sought to bring them under subjection. During the troubles of the League they hoped to establish a republican government in their city, and on the night of 11th March 1590 they exterminated the royal garrison and imprisoned their bishop and the canons. But four years later they surrendered to Henry IV. of France. During the following century the maritime power of St Malo attained some importance. In November 1693 the English vainly bombarded St Malo for four consecutive days. In July 1695 they renewed the attempt, but were equally unsuccessful. The people of St Malo had in the course of a single war captured upwards of 1500 vessels (several of them laden with gold and other treasure) and burned a considerable number more. Enriched by these successes and by the wealth they drew from Peru, the shipowners of the town not only supplied the king with the means necessary for the famous Rio de Janeiro expedition conducted by Duguay-Trouin in 1711, but also lent him £1,200,000 for carrying on the War of the Spanish Succession. In June 1758 the English sent a third expedition against St Malo under the command of Marlborough, and inflicted a loss of £480,000 in the harbour. But another expedition undertaken in the following September received a complete check. In 1778 and during the wars of the empire the St Malo privateers resumed their activity. In 1789 St Servan was separated from St Malo and in 1790 St Malo lost its bishopric. During the Reign of Terror the town was the scene of sanguinary executions. Among the celebrities born in St Malo are Jacques Cartier, Duguay-Trouin, Surcouf, and Mahé de la Bourdonnais—all four of naval fame—Maupertuis, Chateaubriand, the Abbé de Lamennais, and Broussais.

ST MARTIN, one of the Lesser Antilles (West Indies), part of which (20 square miles) belongs to France and forms a dependency of Guadeloupe, while the remainder (18 square miles) belongs to Holland and along with Saba, &c., is a dependency of Curaçao. Situated in 18° N. lat. and 63° W. long., it ascends to a height of 1380 feet above the sea, and has a comparatively small cultivable area. The great saltpans of the Dutch portion produced in 1882 276,434 tons of salt, and there are similar saltpans in the French portion. Sugar and live-stock (horses, cattle, sheep, goats, and pigs) are also exported. The chief settlement and anchorage in the French portion is Marigot, in the Dutch Philippsburg. The population in 1882 was 7083 (French portion 3724, Dutch 3359). Occupied by French freebooters in 1638 and by the Spaniards between 1640 and 1648, St Martin was divided between the French and Dutch in this latter year.

SAINT-MARTIN, LOUIS CLAUDE DE (1743-1803), known as "le philosophe inconnu" from the fact that all his works were published under that name, was born at Amboise of a poor but noble family, on the 18th January 1743. By his father's desire he tried first law and then the army as a profession. While in garrison at Bordeaux, he came under the influence of Martinez Pasqualis, a Portu-

guese Jew, who taught a species of mysticism drawn from cabalistic sources, and endeavoured to found thereon a secret cult with magical or theurgical rites. In 1771 Saint-Martin left the army in order to become a social preacher of mysticism. His conversational powers made him welcome in the most aristocratic and polished Parisian salons; but his missionary zeal led him to England, Italy, and Switzerland, as well as to the chief towns of France. At Strasburg in 1788 he met Charlotte de Boecklin, who initiated him in the writings of Jacob Boehme, and at the same time inspired in his breast a semi-romantic attachment. His later years were devoted almost entirely to the composition of his chief works and to the translation of those of Boehme. He died at Aunay, near Paris, on the 23d October 1803.

His chief works are—*Lettre à un ami sur la Révolution Française; Éclair sur l'association humaine; De l'esprit des choses; Ministère de l'homme-esprit*. Other treatises appeared in his *Œuvres posthumes* (1807). Saint-Martin regarded the French Revolution as a sermon in action, if not indeed a miniature of the last judgment; its result was to be the regeneration of society by a destruction of its abuses. His ideal society was "a natural and spiritual theocracy," in which God would raise up men of mark and endowment, who would regard themselves strictly as "divine commissioners" to guide the people through the crises of their history. This mystical dictatorship was to rest entirely upon persuasion. In like manner all ecclesiastical organization was to disappear, giving place to a purely spiritual Christianity, the doctrines of which constitute a species of theosophy. Their philosophical basis in Saint-Martin is the assertion of a faculty superior to the reason, which he calls the moral sense, and from which we derive our knowledge of God. In man, and not elsewhere, is to be found the key to the divine nature. God exists as an eternal personality, and the creation is an overflowing of the divine love, which was unable to contain itself. The human soul, the human intellect or spirit, the spirit of the universe, and the elements or matter are the four stages of this divine emanation, man being the immediate reflexion of God, and nature in turn a reflexion of man. Man, however, has fallen from his high estate, and matter is one of the consequences of his fall. But the divine love, united to humanity in Christ, will work the final regeneration or restoration of all things.

Comp. Gence, *Notice biographique* (1824); Caro, *Essai sur la vie et les doctrines de Saint-Martin* (1852); Sainte-Beuve, *Causeries de Lundi*, vol. x. p. 190; Matter, *Saint-Martin, le philosophe inconnu* (1862); Franck, *La philosophie mystique en France à la fin du dix-huitième siècle* (1866).

ST MAUR-SUR-LOIRE, founded by St Maurus (see MAURUS), was the first Benedictine monastery in Gaul. It was situated on the left bank of the Loire about 15 miles below Saumur. About the middle of the 9th century it was reduced to ruins by the Normans; shortly before the event and in anticipation of it the relics of the saint were transferred to St Maur-les-Fossés near Paris. St Maur-sur-Loire was afterwards restored and fortified, but the only extant remains consist of a part of the church and a few shattered columns.

ST MICHAEL'S. See AZORES, vol. iii. p. 171.

ST NAZAIRE, a town of France, in the department of Loire Inférieure, and a port on the right bank of the Loire near its mouth. It has rapidly grown since the new docks rendered it the outport or detached harbour of NANTES (*q.v.*), from which it is distant 29 miles west-north-west by water and 40 by rail. Begun in 1845 and opened in 1857, the first basin has an area of 26 acres and 1 mile of quays; and the depth varies from 20 to 25 feet. To the north of the first basin a new dock (Penhouet), 56 acres in extent and with $1\frac{1}{2}$ miles of quay, was constructed between 1864 and 1881, at a cost of nearly £1,000,000. It communicates with the older basin by a passage 82 feet wide and 673 long. The harbour can admit vessels of 23 feet draught at every tide, the depth of water on the sill varying from 26 to 30 feet at high tide, and never being less than 13. The town is the terminus of the General Transatlantic Company, whose steamers connect France with Mexico, the Antilles, and the Isthmus of Panama. The total imports and exports amount to about 1,600,000 tons annually, valued at £24,000,000. The staple articles

imported are coals from Great Britain (500,000 tons), grain, sugar, coffee, rice, timber (from the North), phosphates, and guano. Pit-props, salt, and preserved foods are exported. The town being of recent origin, its industries are only in process of development; but it already contains shipbuilding yards, large ironworks, artificial fuel factories, sawmills, a flour-mill, and extensive commercial warehouses. There are no edifices of historical or architectural note with the exception of a granite dolmen, 10 feet long and 5 broad, resting horizontally on two other stones sunk in the soil, above which they rise $6\frac{1}{2}$ feet. The population was 16,314 in 1881 (19,626 in the commune).

According to certain remains discovered on excavating the docks, St Nazaire seems to occupy the site of the ancient Corbilo, placed by Strabo among the more important maritime towns of Gaul, and probably founded by the Phœnicians. It was in the harbour of Corbilo that Crassus by Cæsar's order built the fleet by which, in 56 B.C., Brutus routed the 220 vessels of the Venetian insurgents. At the close of the 4th century the site of Corbilo was occupied by Saxons, and, their conversion to Christianity being effected one or two hundred years later by St Felix of Nantes, the place took the name of St Nazaire. It was still only a little "bourg" of 3000 inhabitants when it was chosen as the site of the new harbour for Nantes, because the ascent of the Loire was becoming more and more difficult. In 1868 the sub-prefecture was transferred to St Nazaire from Savenay.

ST NICOLAS, a town of Belgium, in the district of Dendermonde, in the province of East Flanders, $19\frac{1}{2}$ miles from Ghent by the railway to Antwerp. It is a well-built, modern-looking place, with a very spacious market-place, famous as the spot where Philip the Fair swore in 1497 to maintain the privileges of Waesland, of which St Nicolas was the capital. From a comparatively small village, with only 5000 inhabitants in 1661, it has grown into a large manufacturing centre, with wool and cotton mills, needle-factories, &c., and a population (in 1876) of 24,729. The more conspicuous buildings are the town-hall and two of the churches.

ST OMER, a town and fortress of France, chef-lieu of the department of Pas-de-Calais, situated on the Aa (which flows into the North Sea), 177 miles north of Paris by the railway to Arras, Hazebrouck, and Calais, at the junction of a line to Boulogne. Before the modifications made in the defensive system of the frontier the place was a fortress of the first class. At St Omer begins the canalized portion of the Aa, which reaches the sea at Gravelines, and under its walls it connects with the Neuffossé, which ends at the Lys. There are two harbours outside and one within the city. St Omer has wide streets and spacious squares, but little stir of life. The old cathedral is the most curious church in Artois; it belongs almost entirely to the 13th, 14th, and 15th centuries. Of its four portals the finest, dating from the 13th and 14th centuries, was decorated with statuettes, unfortunately mutilated during the Revolution. In spite of the spoliations of the 18th century, the contents of the church still comprise interesting paintings, a Virgin in wood of the 12th century (the object of numerous pilgrimages, and solemnly crowned in 1875), a colossal statue of Christ seated between the Virgin and St John (13th century, originally belonging to the cathedral of Thérouanne and presented by Charles V.), fine stained glass and mosaics, interesting tombstones, the cenotaph of St Omer, and numerous ex-votos, distinguished by their antiquity, originality, and delicacy of workmanship. The clearing of the church from the encroachments of other buildings has led to the reconstruction of the apsidal chapel of the Sacred Heart in the purest Gothic style. Of St Bertin, the church of the abbey (built between 1326 and 1520 on the site of previous churches), where Childeric III. retired to end his days, nothing now remains but some arches and a tower, 190 feet high, which serves to adorn the public gardens (once possessed by the monks). Several

other churches or convent chapels are of interest, but it is enough to mention St Sepulchre's (14th century) for the sake of its beautiful stone spire and stained-glass windows. A fine collection of records, a picture gallery, and a theatre are all accommodated in the town-hall, built of the materials of the abbey of St Bertin. Among the five hospitals the military hospital is of note as occupying the college opened by the English Jesuits in 1592 and known as the place where O'Connell received his education. The old episcopal palace is used as a court-house. Several learned societies exist in the town; the public library contains 20,000 volumes and 1000 MSS. The arsenal is an extensive series of buildings. Besides 30,000,000 to 40,000,000 tobacco-pipes exported to America and the colonies, St Omer manufactures cloth, hosiery, and tulle, cambric, and muslin embroideries. Its trade (and it is the seat not only of a tribunal but also of a chamber of commerce) is mainly in provisions for England, the products of the local industry, and those of the paper-mills, flour-mills, distilleries, and sugar-factories in the vicinity, especially along the banks of the Aa. The suburb of Haut Pont to the north of St Omer is inhabited by a special stock, which has remained faithful to the Flemish tongue, its original costume, and its peculiar customs, and is distinguished by honesty and industry. The ground which these people cultivate has been reclaimed from the marsh, and the lègres (*i.e.*, the square blocks of land) communicate with each other only by boats floated on the ditches and canals that divide them. At the end of the marsh, on the borders of the forest of Clairmarais, are the ruins of the abbey founded in 1140 by Thierry d'Alsace, to which Thomas a Becket betook himself in 1165. To the south of St Omer on a hill commanding the Aa lies the camp of Helfaut, often called the camp of St Omer. On 15th June 1884 a statue was erected to Jacqueline Robin, a heroine who in the time of Louis XIV. saved St Omer from foreign occupation. The population of the town was 20,479 in 1881 (21,556 in the commune).

Near a castle named Sithiu, Omer, bishop of Thérouanne, erected churches and the monks of Luxeuil established monasteries in the 7th century; and in the 9th century the village thus originated took the name of its founder St Omer. The Normans laid the place waste in 861 and 881, but ten years later found town and monastery surrounded by walls and safe from their attack. Situated on the borders of territories frequently disputed by French, Flemish, English, and Spaniards, St Omer long continued subject to siege and military disaster. In 1071 Philip I. put all to sword and flame. Burned in 1136, captured in 1198 by Richard and Baldwin IX., attacked in 1214 by Ferrand of Portugal, in 1302 and 1303 by the Flemish, in 1337 and 1339 by the English, and in 1477 by Louis XI., St Omer at last fell in 1487 into the hands of Charles VIII. Two years later it was recovered by the archduke Maximilian; and Charles V. strengthened its ramparts with bastions. The French made five futile attempts against it between 1551 and 1596, and had no better success in 1638 (under Richelieu) or in 1647. But on 26th April 1677, after seventeen days' siege, Louis XIV. forced the town to capitulate; and the peace of Nimeguen permanently confirmed the conquest. From time to time the people of St Omer (Audomarois) still celebrate the entrance into the town of William Cliton, count of Flanders, from whom in 1127 they obtained a communal charter granting them numerous privileges. St Omer ceased to be a bishopric in 1790.

SAINTONGE (*Santonica*, *Santonensis tractus*), an old province of France, of which SAINTES (*q.v.*) was the capital, was bounded on the N.W. by Aunis, on the N.E. by Poitou, on the E. by Angoumois, on the S. by Guienne, and on the W. by Guienne and the Atlantic. It now forms a small portion of the department of Charente and the greater part of that of Charente Inférieure.

ST OUEN, an industrial district in the outskirts of Paris, on the right bank of the Seine, 1 mile above St Denis. It had 17,718 inhabitants in 1881. The docks (6 acres in area), where the boats from the lower Seine discharge, are connected by rail with the Northern and Eastern lines at Paris and with the circular railway near Batignolles.

The importance of St Ouen is mainly due to its industrial establishments,—foundries and forges, steam-engine factories, dyeworks, waxcloth works, potteries, &c.; it has also the steam-pumps for supplying the upper quarters of Paris with water from the river, a racecourse, and a fine castle, occupying the site of the building in which Louis XVIII. signed (2d May 1814) the declaration by which he promised a charter to France.

ST PAUL, a city of the United States, second city of Minnesota, a port of entry and the capital of the State and of Ramsey county, is situated in 44° 52' 46" N. lat. and 93° 5' W. long., on the Mississippi river, 2150 miles from its mouth, 10 below the falls of St Anthony, the natural head of navigation, and 360 north-west of Chicago. The ground on which the city is built rises from the river in a series of terraces, the ascent being in many places precipitous and not easily adapted to urban uses. The city is mainly confined to the second and third terraces, but is gradually spreading over the elevated plateau beyond. The difficulties of the situation have much increased the cost of erecting large business structures, circumscribed the business quarter, and impeded the railway companies in securing convenient and adequate facilities. The city site is underlaid with a thick stratum of bluish limestone, which comes near the surface, and which, while it renders excavation expensive, furnishes unlimited supplies of building material of a fair quality. The streets of the older portions are uncomfortably narrow, but the newer streets are better

Plan of St Paul.

laid out. The chief public buildings are the State capitol (built in 1882), the United States custom-house and post-office, the city-hall, and the city-market. A handsome opera-house and a chamber of commerce building are conspicuous features. In 1885 there were seventy-one church organizations,—9 Episcopal, 7 Presbyterian, 4 Congregational, 12 Methodist, 12 Lutheran, 2 Jewish, 7 Baptist, 11 Roman Catholic, 1 Unitarian, 4 Evangelical, 1 Swedenborgian, and 1 Disciples of Christ. Besides the charitable institutions connected with the church organizations there are an orphan asylum, a home for the friendless, a Swedish hospital, a women's Christian home, and a Magdalen home. Of periodical publications there were issued in 1885 5 dailies, 17 weeklies, and 7 monthlies. The city has (1886) eleven banks, of which six are national with an aggregate paid-up capital of \$5,200,000, and five State institutions with a paid-up capital of \$1,150,000. St Paul is an important railway centre, dividing with Minneapolis the terminal and distributing business of no less than fifteen lines owned by six different corporations and having an aggregate length of 15,818 miles. The navigation of the upper Mississippi acts as a check upon the rates charged by the

railway companies. The traffic at the port of St Paul in 1884 was—tons landed, 45,800; tons shipped, 13,300; passengers carried, 34,625. Two lines of steamers ply between St Paul and St Louis and intermediate points. The average season of navigation lasts six and a half months. The city has within its corporate limits, but removed some miles from the city proper, two colleges—Macalester (Presbyterian) and Hamline (Methodist)—both only partially endowed or supplied with buildings. There are twenty-two public school buildings, built at an aggregate cost of \$663,000. There are also several academies and seminaries under private or denominational management. The public park system of St Paul is as yet undeveloped, but an area of 250 acres has been secured near Lake Como to be laid out as pleasure-grounds. Rice Park and Smith Park are public squares in the central portion of the city, tastefully adorned with walks and shrubbery. The population of St Paul, according to the United States census, was 840 in 1850, 10,600 in 1860, 20,300 in 1870, and 41,473 in 1880 (males 22,483, females 18,990). According to the State census, it was 111,334 in 1885.

St Paul is a commercial rather than a manufacturing city. The jobbing trade for the year 1884 reached a total of about \$65,000,000, an increase of 50 per cent. in four years. In the same year manufactures valued at \$20,000,000 were produced, the principal items being agricultural implements, boots and shoes, machinery, sash, doors, and blinds, waggons and carriages. There is a large flour-mill, capable of producing 700 barrels daily. The lack of water-power and the high cost of fuel are drawbacks to the growth of manufactures. The main thoroughfares have recently been paved, for the most part with blocks of white cedar, and stone sidewalks are rapidly replacing wooden ones. The water-supply is obtained from a group of small lakes lying north of the city limits, and the works are owned and managed by the city. The drainage is excellent. For governmental purposes the city consists of eight wards, each of which elects three members of council. The chief of police and all subordinate members of the force are appointed by the mayor, who is elected by popular vote in May of each alternate year. The aggregate assessed valuation of real and personal property in St Paul was \$60,463,000 in 1884. The total bonded debt of the city on 31st March 1885 was officially stated at \$3,027,141.

The first settlement on the site of St Paul was in 1838, when an unimportant trading-post was established there by adventurers. In 1841 a Jesuit missionary built a log chapel and dedicated it to St Paul (whence the name of the hamlet). The site of the future city was surveyed and laid out in 1849-50. About this time (1851) the Sioux Indians ceded to the United States all lands held by them between the Mississippi and Big Sioux rivers. Prior to this cession the white population in the then Territory of Minnesota had not reached a total of 6000, but the removal of the aborigines was promptly followed by a notable influx of white settlers. With a population of some 2800 in 1854 the town obtained a fully organized city government. Upon the admission of Minnesota to the Union in 1858 St Paul was designated as the capital. The city was originally confined to the east bank of the river, but in 1874 by popular vote a portion of Dakota county was transferred to Ramsey county, and West St Paul on the west bank of the Mississippi, then containing some 3000 inhabitants, became a part of St Paul proper. In 1884 an Act of the State legislature extended the geographical boundaries of the city so as to embrace all territory in Ramsey county westward to the line of Hennepin county, and virtually to the corporate limits of the "sister" city Minneapolis, 10 miles distant.

ST PAUL, a remarkable volcanic island which, along with the island of New Amsterdam, is situated in the Indian Ocean about midway between Africa and Australia, a little to the north of the ordinary route of the steamers from Plymouth (via Cape Town) to Adelaide. Its exact position as determined by the Transit of Venus Expedition in 1874 is 38° 42' 50" S. Lat. and 77° 32' 29" E. Long. Though the distance between the two islands St Paul and New Amsterdam is only 50 miles, they belong to two separate eruptive areas characterized by quite different products; and the comparative bareness of St Paul is in striking contrast to the dense vegetation of New Amsterdam. St Paul is 1½ miles long from north-west to south-east and its coast-line is estimated at 5 nautical miles. In shape it is almost an isosceles triangle with a circle inscribed

tangentially to the north-east side,—the circle (3940 feet in diameter) being the volcanic crater which previous to 1780 formed an inland lake, but which, since the sea broke down its eastern barrier, has become practically a land-locked bay entered by a narrow but gradually widening passage not quite 6 feet deep. The highest ridge of the island is not more than 820 feet above the sea. On the south-west side the coasts are inaccessible. According to M. Vélain, the island originally rose above the ocean as a mass of rhyolitic trachyte similar to that which still forms the Nine Pin rock to the north of the entrance to the crater. Next followed a period of activity in which basic rocks were produced by submarine eruptions—lavas and scoræ of anorthitic character, palagonitic tuffs, and basaltic ashes; and finally from the crater, which must have been a vast lake of fire like those in the Sandwich Islands, poured forth quiet streams of basaltic lavas. The island has been rapidly cooling down in historic times. Dr Gillian (Lord Macartney's visit, 1793) mentions spots still too warm to walk on where no trace of heat is now perceptible; and the remarkable zone of hot subsoil extending westwards from the crater has lost most of the more striking characteristics recorded by Hochstetter in 1857, though it is still easily distinguished by its warmth-loving vegetation, —*Sphagnum lacteolum* and *Lycopodium cernuum*.

The general flora of the island is exceedingly meagre. If we leave out of view the potato, carrot, parsley, cabbage, &c., introduced by temporary inhabitants, the list comprises *Umbelliferae*, 1; *Compositae*, 2; *Plantaginaceae*, 2; *Cyperaceae*, 2; *Graminaceae*, 2; *Lycopodiaceae*, 1; ferns, 2; and from 35 to 40 species of mosses and lichens. The only plants really abundant are an *Isolopis nodosa* (*Cyperaceae*) and one or two grasses. None of the trees (oak, apple, mulberry, pine, &c.) introduced at different periods have succeeded. The cabbage, which grows pretty freely in some parts, shows a tendency to become like the Jersey variety. The pigs mentioned by Hochstetter have died out; but goats, cats, rats, and mice continue to flourish,—the cats, which feed mainly on birds and fish, living in apparent amity and in the same holes with the rats. House-flies, bluebottles, slaters, &c., literally swarm. But nothing is so characteristic of St Paul as the multitude of its sea-fowl,—albatrosses, petrels of many kinds, puffins, penguins, &c. The neighbouring waters teem with life, and, while the various genera of the seal family are no longer a source of wealth, a number of vessels (50 to 80 tons) from the Mascarene Islands still yearly carry on the fisheries off the coasts, where *Cheilodactylus fasciatus* (in shoals), *Latris hecateia* (cabot or poisson de fond), and *Mendosoma elongatum* afford a rich harvest. The stories told about gigantic sea creatures were curiously confirmed by the Venus Expedition finding on the shore a Cephalopod (since named *Mouchezis sancti pauli*) which measured upwards of 22 feet from the end of its body to the tip of its longest arm.

The island now known as New Amsterdam was probably that sighted on 18th March 1522 by the companions of Magellan as they sailed back to Europe under the command of Sebastian del Cano; and in 1617 the Dutch ship "Zeewolf" from Texel to Bantam discovered the island which, instead of the name "Zeewolf" then bestowed on it, soon after began to be called on the charts St Paul. The designation "New Amsterdam" is derived from the vessel in which Van Diemen sailed between the islands in 1633. The first navigator to set foot on St Paul was Willem van Vlaming in 1696. Lord Macartney spent a day exploring it in 1793, his guide being a marooned Frenchman, Captain Péron, whose narrative of his sojourn from 1st September 1792 to 16th December 1795 is a document of great value (*Mémoires du Capitaine Péron*, vol. i., Paris, 1824). In 1843 the governor of Réunion took possession of the islands with a detachment of marines,—seal-catching and the fisheries having attracted to them a considerable floating population. In June 1871 the British frigate "Megæra" was wrecked at the mouth of the crater and most of the 400 souls on board had to reside on the island for upwards of three months. Landing on 23rd September 1874, a French Transit of Venus expedition remained on St Paul till 8th January 1875, and a visit of much importance was paid to New Amsterdam.

See Vélain, *Description géol. de la presqu'île d'Aden, des îles de la Réunion, de St Paul, &c.* (Paris, 1878), and his papers in *Archives de la zoologie expérimentale*, 1877; and in *Comptes Rendus, Acad. des Sc.*, 1875; Sauvage on the fishes in *Arch. Zool. Exp.*, 1879-80.

ST PAUL DE LOANDA. See LOANDA.

ST PAUL'S ROCKS, not to be confounded with the island of St Paul in the Indian Ocean, are a number of small islands in the Atlantic, nearly 1° north of the equator and

540 miles from South America, in $29^{\circ} 15' W.$ long. Their outline is irregular, and as they are only separated by narrow but deep chasms they have the appearance of being one island. The whole space occupied does not exceed 1400 feet in length by about half as much in breadth. Besides sea-fowl—two species of noddy (*Anous stolidus* and *Anous melanogenys*) and a booby or gannet (*Sula leucogaster*)—the only terrestrial inhabitants are insects and spiders. Fish are abundant, seven species (one, *Holocentrum sancti pauli*, peculiar to the locality) being collected by the "Challenger" during a brief stay. Darwin (*On Volcanic Islands*, p. 32) decided that St Paul's Rocks were not of volcanic origin; more modern investigators—Renard, A. Geikie, and Wadsworth—maintain that they probably are eruptive. See *Reports of the Voyage of H.M.S. Challenger: Narrative of the Cruise*, vol. i.

ST PETER PORT, the capital of the island of GUERNSEY (*q.v.*); its population was 16,658 in 1881.

ST PETERSBURG, a government of north-western Russia, at the head of the Gulf of Finland, stretching along its south-eastern shore and the southern shore of Lake Ladoga. It is bounded by Finland and Olonetz on the N., Novgorod and Pskoff on the E. and S., Esthonia and Livonia on the W., and has an area of 20,750 square miles. It is hilly only on its Finland border, the remainder being flat and covered with marshy forests, with the exception of a plateau of about 350 feet high in the south, the Duderhof hills at Krasnoye Selo reaching 550 feet. A great number of parallel ridges of glacier origin intersect the government towards Lake Peipus and northwards of the Neva. Silurian and Devonian rocks appear in the south, the whole covered by a thick glacial deposit with boulders (bottom moraine) and by thick alluvial deposits in the valley of the Neva. The government skirts the Gulf of Finland for 130 miles. The bays of Cronstadt, Koporye, Luga, and Narva afford good anchorage, but the coast is for the most part lined with reefs and sandbanks; to the east of Cronstadt the water becomes very shallow (18 to 20 feet). The chief river is the Neva, which receives only a few small tributaries; the Luga and the Narova also enter the Gulf of Finland. The feeders of Lake Ladoga—the Volkhoff, the Syass, and the Svir, the last two forming part of the system of canals connecting the Neva with the Volga—are important channels of commerce, as also is the Narova (see PSKOFF). Marshes and forests cover about 40 per cent. of the surface (70 per cent. at the end of the 18th century).

The population (apart from the capital) was 635,780 in 1882, 82.7 per cent. being Russians, 15.0 Finns, 0.5 Esthonians, and 1.8 per cent. German colonists who have immigrated since 1765. Twenty per cent. are Protestants; the remainder mostly belong to the Greek Church; but there are also more than 20,000 Nonconformists, about 6000 Catholics, and 1500 Jews. Agriculture is at a low stage and very unproductive; the Germans, however, get advantage from it. The Finns rear cattle to some extent. Manufactures are especially developed in the districts of Tsarskoye Selo and Yamburg,—cottons, silks, paper, ironware, and machinery (at Kolpino) being the chief products. Several large manufacturing establishments—especially at Cronstadt—are maintained by the state for military purposes. The government is subdivided into eight districts, the chief towns of which are St Petersburg (see below), Gdoff (3150 inhabitants), Luga (1650), Novaya Ladoga (4100), Peterhof (7950), Schlisselburg (10,400), and Yamburg (3250). Gatchina (10,100), Narva (8610), Oranienbaum (3600), and Pavlovsk (3400) have no districts. Cronstadt and the capital form separate governorships. Okhta, Kolpino, Pulkova, and Krasnoye Selo, though without municipal institutions, are worthy of mention.

ST PETERSBURG, capital of the Russian empire, is situated in a thinly-peopled region at the head of the Gulf of Finland, at the mouth of the Neva, in $59^{\circ} 56' N.$ lat. and $30^{\circ} 40' E.$ long., 400 miles from Moscow, 696 from Warsaw, 1138 from Odessa, and 1338 from Astrakhan. The city covers an area of 21,195 acres, of which 12,820

belong to the delta proper of the Neva; 1330 acres are under water. The Neva, which leaves Lake Ladoga at its south-west angle, flows in a wide and deep stream for 36 miles south-west and north-west, describing a curve to the south. Before entering the Gulf of Finland, it takes for $2\frac{1}{2}$ miles a northerly direction; then it suddenly turns and flows south-west and west, forming a peninsula on which the main part of St Petersburg stands, itself subdividing into several branches. It discharges a body of remarkably pure water at the rate of 1,750,000 cubic feet per second, by a channel from 400 to 650 yards in width, and so deep (maximum depth, 59 feet) that large vessels approach its banks. The chief branch is the Great Neva, which flows south-west with a width of from 400 to 700 yards and a maximum depth of 49 feet (discharge, 1,267,000 cubic feet per second). The other branches are the Little Neva, which along with the Great Neva forms Vasilyevskiy

FIG. 1.—Environs of St Petersburg.

(Basil's) Island, and the Great Nevka, which with the Little Neva forms Peterburgskiy Island and sends out three other branches, the Little Nevka, the Middle Nevka, and the narrow Karpovka, enclosing the islands Elaghin, Krestovskiy, Kamennyi, and Aptekarskiy (Apothecaries' Island). Smaller branches of the Great and the Little Nevas form the islands Petrovskiy, Goloday, and numerous smaller ones; while a broader navigable channel forms the Gutueff and several islands of less size in the south-west. Two narrow canalized channels or rivers—the Moika and the Fontanka—as also the Catherine, Ligovskiy, and Obvodnyi Canals (the last with basins for receiving the surplus of water during inundations), intersect the mainland. All the islands of alluvial origin are very low, their highest points rising only 10 or 11 feet above the average level of the water. Their areas are rapidly increasing (572 acres having been added between 1718 and 1864), and the wide banks which continue them towards the sea are gradually disappearing. The mainland is not much higher than the islands. At a height of from 7 to 20 feet (seldom so much as 29) the low marsh land stretches back to the hills of the Forestry Institute (45 to 70 feet) on the right and to the Pulkova and Tsarskoye Selo hills on the left. The river level being subject to wide oscillations and rising several feet during westerly gales, extensive portions of the islands, as also of the mainland, are flooded every winter; water in the streets of Vasilyevskiy Island is a common occurrence. In 1777, when the Neva rose 10.7 feet, and in 1824, when it rose 13.8 feet, nearly the whole of the city was inundated. But, owing to the construction of canals to receive a large amount of surplus water, and still more to the secular rising of the sea-coast, no similar occurrence has since been witnessed.

Broad sandbanks at the mouth of the river, leaving but a narrow channel 7 to 20 feet deep, prevent the entrance of larger ships; their cargoes are discharged at Cronstadt

and brought to St Petersburg in smaller vessels. A ship canal, completed in 1885 at a cost of 10,265,400 roubles (£1,026,500), is intended to make the capital a seaport. Beginning at Cronstadt, it terminates at Gutueff Island in a harbour capable of accommodating fifty sea-going ships at a time. It is 22 feet deep, $17\frac{1}{2}$ miles in length, and from 70 to 120 yards broad at the bottom, and is protected by huge submarine dams.

Communication between the banks of the Neva is maintained by only two permanent bridges,—the Nicholas and the Alexander or Liteinyi, the latter 467 yards long; both are fine specimens of architecture. Two other bridges—the Palace and the Troitskiy (720 yards)—across the Great Neva connect the left bank of the mainland with Vasilyevskiy Island and the fortress of St Peter and St Paul; but, being built on boats, they are removed during the autumn and spring, and intercourse with the islands then becomes very difficult. Several wooden or floating bridges connect the islands, while a number of stone bridges span the smaller channels; their aggregate number is ninety. In winter, when the Neva is covered with ice 2 to 3 feet thick, temporary roadways for carriages and pedestrians are made, and artificially lighted. Numerous boats also maintain communication, and small steamers ply in summer between the more distant parts of the capital. A network of tramways (about 80 miles) intersects the city in all directions, reaching also the remoter islands and suburbs, and carrying about 45,000,000 passengers yearly. Omnibuses and public sledges maintain the traffic in winter. In 1882 hackney carriages numbered 7930 in summer and rose to 14,780 in winter, when thousands of peasants come in from the neighbouring villages with their small Finnish horses and plain sledges.

The Neva continues frozen for an average of 147 days in the year (25th November to 21st April). It is unnavigable, however, for some time longer on account of the ice from Lake Ladoga, which is sometimes driven by easterly winds into the Neva during several days at the end of April or in the beginning of May. The climate of St Petersburg is very changeable and unhealthy. Frosts are made much more trying by the wind which accompanies them; and westerly gales in winter bring with them oceanic moisture and warmth, and so melt the snow before and after hard frosts. The summer is hot, but short, lasting hardly more than five or six weeks; a hot day, however, is often followed by cold weather: changes of temperature amounting to 35° Fahr. within twenty-four hours are not uncommon. In autumn a cold dampness continues for several weeks, and in spring cold and wet weather alternates with a few warm days. The following figures will give a more complete idea of the climate:—

	January.	July.	The Year.
Mean temperature, Fahr.....	15°·4	64°·0	38°·6
Rainfall, inches	0·9	2·6	18·8
Amount of cloud, percentage	80	53	67
Prevailing winds	S. W.	W.	W.
Number of rainy days	12·5	12·7	150·6
Average daily range of temperature, Fahr. 2°·2		10°·2	7°·7
Relative humidity	89	74	81

The bulk of St Petersburg is situated on the mainland, on the left bank of the Neva, including the best and busiest streets, the richest shops, the great bazaars and markets, the palaces, cathedrals, and theatres, as well as all the railway stations, except that of the Finland Railway. From the Liteinyi bridge to that of Nicholas I. a granite embankment runs along the left bank of the Neva, bordered by palaces and large private houses. About midway, behind a range of fine houses, stands the admiralty, the very centre of the capital. Formerly a wharf, on which Peter I. caused his first Baltic ship to be built in 1706, it is now the seat of the ministry of marine and of the hydrographical department, the new admiralty standing farther down the Neva on the same bank. A broad square, now partly a garden, surrounds the admiralty on the west, south, and east. To the west, opposite the senate, stands the fine memorial to Peter I., erected in 1782, and now backed by the cathedral of St Isaac. A bronze statue, a masterpiece by Falconet, represents the founder of the city on horseback, at full gallop, ascending a rock and pointing to the Neva; the pedestal is a huge granite monolith, 44 feet long, 22 wide, and 27 high, brought from Lakhta, a village on the shore of the Gulf of Finland. To the south of the admiralty are several buildings of the ministry of war and to the east the Winter Palace, the work of Rastrelli (1764), a fine building of mixed style; but its admirable proportions

hide its huge dimensions. It communicates by a gallery with the Hermitage Fine Arts Gallery. A broad semicircular square, adorned by the Alexander I. column, separates the palace from the general staff and foreign ministry buildings; the column, the work of Montferrant, is a red granite monolith, 84 feet high, supported by a huge pedestal. Being of Finnish *rappa-kivi* (from Piterlaks), it disintegrates rapidly, and has had to be bound with massive iron rings concealed by painting. The range of palaces and private houses facing the embankment above the admiralty is interrupted by the large macadamized "Field of Mars," formerly a marsh, but transformed at incredible expense into a parade-ground, and the Lyetnyi Sad (summer-garden) of Peter I. The Neva embankment is continued to the west to a little below the Nicholas bridge under the name of "English embankment," and farther down by the new admiralty buildings.

The topography of St Petersburg is very simple. Three long streets, the main arteries of the capital, radiate from the admiralty,—the Prospekt Nevskiy (Neva Prospect), the Gorokhovaya (Peas' Street), and the Prospekt Voznesenskiy (Ascension Prospect). Three girdles of canals, roughly speaking concentric, cross these three streets,—the Moika, the Catherine, and the Fontanka; to these a number of streets run parallel,—the Great and the Little Morskaya, the Kazanskaya, the Sadovaya (Garden Street), and the Liteinaya, continued west by Prospekt Zagorodnyi and Rizhskiy (Riga). The Prospekt Nevskiy is a very broad street running straight east-south-east for 3200 yards from the admiralty to the Moscow railway station, and thence 1650 yards farther, bending a little to the south, to the Smolnyi convent, again reaching the Neva at Kalashnikoff harbour. The part first mentioned owes its picturesque aspect to its width, its rich shops, and still more its animation. But the houses which border it architecturally leave very much to be desired. And neither the cathedral of the Virgin of Kazan (an ugly imitation on a small scale of St Peter's in Rome), nor the still uglier Gostinyi Dvor (a two-storied quadrilateral building filled with second-rate shops), nor the Anitchkoff Palace (which looks like immense barracks), nor even the Catholic and Dutch churches do anything to embellish it. About midway between the public library and the Anitchkoff Palace an elegant square conceals the old-fashioned Alexandra theatre; a profusely adorned memorial to Catherine II. does not beautify it much. The Gorokhovaya is a narrow and badly paved street between gloomy houses occupied mostly by artisans. The Voznesenskiy, on the contrary, though as narrow as the last, has better houses. In its north part it passes into a series of large squares connected with that on which the monument of Peter I. stands. One of them is occupied by the cathedral of St Isaac (of Dalmatia) and another by the memorial to Nicholas I., the gorgeousness and bad taste of which strangely contrast with the simplicity and significance of that of Peter I. The general aspect of the cathedral is undoubtedly imposing both without and within; its red granite colonnades are not devoid of a certain grandiose character; but on the whole this architectural monument, built between 1818 and 1858 according to a plan of Montferrant, under the personal direction of Nicholas I., does not correspond either with its costliness (23,000,000 roubles) or with the efforts put forth in its decoration by the best Russian artists. The pictures of Brilloff, Bruni, and many others which cover its walls are deteriorating rapidly and their place is being taken by mosaics. The entire building, notwithstanding its vast foundations and pile-work, is subsiding unequally in the marshy ground, and the walls threaten soon to give way.

The eastern extremity of Vasilyevskiy Island is the centre of commercial activity; the stock exchange is situated there as well as the quays and storehouses. The remainder of the island is occupied chiefly by scientific and educational institutions,—the academy of science, with a small observatory (where some astronomical observations are carried on, notwithstanding the tremors of the earth), the university, the philological institute, the academy of the first corps of cadets, the academy of arts, the marine academy, the mining institute, and the central physical observatory, all facing the Neva. Peterburgskiy Island contains the fortress of St Peter and St Paul, opposite the Winter Palace, separated by a channel from its "kronverk," the glacis of which is used as a park. The fortress is now merely a state prison. A cathedral which stands within the fortress is the burial-place of the emperors and the imperial family. The mint is also situated within the fortress. The remainder of the island is meanly built, and is the refuge of the poorer officials (*tehinovniks*) and of the intellectual proletariat. Its northern part, separated from the main island by a narrow channel, bears the name of Apothecaries' Island, and is occupied by a botanical garden of great scientific value and several fine private gardens and parks. Krestovskiy, Elaghin, and Kamennyi Islands, as also the opposite right bank of the Great Nevka (Staraya and Novaya Derevnaya), are occupied by public gardens and parks and by summer houses (*datchis*). Owing to the heat and dust during the short summer the middle-class inhabitants and the numerous officials and clerks emigrate to the *datchis*, the wealthier families to the islands, and the poorer to Staraya and Novaya Derevnaya Polustrovo, Kushe-

leva, and as far as the first two or three railway stations of the principal railways, especially that of Finland. The mainland on the right bank of the Neva above its delta is known as Vyborgskaya Storona (Vyborg Side), and is connected with the main city by the Liteinyi bridge, closely adjoining which are the buildings of the military academy of medicine and spacious hospitals. The small streets (many of them unpaved), with numerous wooden houses, are inhabited by students and workmen; farther north are great textile and iron factories. Vast orchards and the yards of the artillery laboratory stretch north-eastwards, while the railway and the highroad to Finland, running north, lead to the park of the Forestry Institute. The two villages of Okhta, on the right

bank, are suburbs; higher up, on the left bank, are several factories (Alexandrovsk) which formerly belonged to the crown, where playing-cards, cottons, glass, china, ironware, and so on are made. The true boundary of St Petersburg on the south is the Obvodnyi Canal; but wide tracts covered with orchards, cemeteries, and factories, or even unoccupied spaces, are included in the city in that direction, though they are being rapidly covered with buildings.

Of the 21,195 acres covered by St Petersburg 1160 remain unoccupied. The gardens and parks, public and private, take up 798 acres, to which must be added Aptekarskiy, Petrovskiy, Elaghin, and Krestovskiy Islands, which are almost quite covered with parks. Nearly 30 per cent. of the total area of the most densely populated

parts are squares and streets, the aggregate length of the latter being 283 miles. More than half of them are lighted by gas, the remainder with kerosene. Except in a few principal streets, which are paved with wood or asphalt, the pavement is usually of granite boulders, and is bad and very difficult to keep in order. Many streets and embankments in the suburbs are unpaved. Nearly all the more populous parts have water led into the houses (4733 houses in 1883), and the same begins to extend also to the right bank of the Neva. In 1883 7,091,500,000 gallons of water, mostly from the Neva, very pure on the whole,¹ were supplied by seventeen steam-engines to the left-bank portion of the city (9423 gallons per inhabitant). The number of houses in 1881 was 22,229 inhabited and 16,983 uninhabited. Of the former 18,816 belonged to private persons and 3148 to societies or the crown. The houses are mostly very large: of the private houses no fewer than 169 had from 400 to 2000 inhabitants each; the contrary holds good

of the out-lying parts, where 2005 houses had fewer than 20 inhabitants each.

On 27th December 1881 the population of St Petersburg was 861,303, exclusive of the suburbs, and 929,100 including them, thus showing an increase of 29 per cent. since 1869. The census of 1881 having been made with great accuracy, the following interesting results may be relied upon.² The density of population varies from 1 inhabitant per 93 square feet to 1 per 17,346 square feet (on Peterburgskiy Island); the average is 1 per 1068 square feet. Less than a third of the aggregate population (29.3 per cent.) were born in the capital, the remainder coming from all parts of Russia, or being foreigners. The males are to the females in the proportion of 122 to 100; at the same time the married men and women constitute respectively 49 and 39 per cent. of the population, the numbers of the unmarried or widowed being respectively 48 and 3 per cent. for men, and 56 and 5 for women. The proportion of

¹ For analyses, see *Journ. Russ. Chemical Soc.*, vol. xv. 567.

² See *St Petersburg according to the Census of 1881*, and the *Statistical Yearbook of St Petersburg for 1883*, St Petersburg, 1884.

children is small. The distribution of the population according to age is as follows:—

Under 5 years	7.9 per cent.	From 16 to 20 years ..	12.2 per cent.
From 6 to 10 years ..	5.7 " "	21 to 50 " ..	53.2 " "
" 11 to 15 " ..	8.6 " "	Above 50 years	10.4 " "

The mortality at St Petersburg being very high (34.2 in 1883, from 29.7 to 35.6 in 1868-82), and the number of births only 31.1 per 1000, the deaths are in excess of the births by 2500 to 3000 in average years; in 1883 there were 26,320 births (1151 still-born) and 30,150 deaths. It must not be inferred, however, from these figures that the population of St Petersburg would die out if not recruited from without. The larger number of the workmen who come every year to the capital leave their families in the provinces, and the births which occur do not appear among the births of the capital, while the deaths very often do. The chief mortality is due to chest diseases, which prove fatal on the average to 9000 persons annually; diseases of the digestive organs also prevail largely; European and perhaps also Asiatic cholera is almost endemic, an average of 3700 deaths annually being due to this cause. Infectious diseases such as typhus (from 4280 to 5100 deaths during the last few years), diphtheria, and scarlet fever (3500 deaths) are common. Owing to a notable increase of these three infectious diseases the mortality figures for the last few years are above the average. Of 28,212 deaths nearly two-fifths (12,369) were among children under five. Another critical age seems to be that between 21 and 25. The number of marriages in 1883 was 6183 (only 7.1 per 1000 inhabitants); out of a total of 26,320 births 7977 (30 per cent.) were illegitimate; and no fewer than 31 per cent. of all children, both legitimate and illegitimate, born at St Petersburg are nursed in the foundlings' home, which sends most of them to be brought up in villages. More than 100,000 persons enter the public hospitals annually.¹

An interesting feature of the Russian capital is the very high proportion of people living on their own earnings or income ("independent"), as compared with those who live on the earnings or income of some one else ("dependent"). Whereas at Paris and Berlin only 34 and 50 per cent. respectively belong to the former category, the proportion is reversed at St Petersburg: only 33 per cent., 282,678 persons in all, have not their own means of support (18 per cent. of the men and 51 of the women). The proportion of employers to employed, as also the extent of their respective families, are as follows:—

	Traße.	Various industries.	Total.
Employers	8,853	19,508	28,366
Their families	20,857	38,153	59,010
Clerks	3,597	5,581	9,178
Their families	4,163	7,491	11,654
Workmen	37,559	195,850	233,409
Their families	11,997	56,856	68,853
Independent workers ..	8,336	28,954	37,290
Their families	4,470	17,806	22,276

Only a few industrial establishments employ more than twenty workmen, the average being less than ten and the figure seldom falling below five. The great factories are beyond the limits of St Petersburg, which contains a busy population of artisans grouped in small workshops. The proportions of various professions to the total population are as follows:—workmen, 1 in 3; servants, 1 in 10; scholars, 1 in 12; soldiers, 1 in 25; officials, 1 in 61; "rentiers," 1 in 76; female teachers, 1 in 186; male teachers, 1 in 291; policemen, 1 in 208; surgeons, 1 in 608; advocates, 1 in 1261; apothecaries, 1 in 1538; pawnbrokers, 1 in 1846; *savants* or *littérateurs*, 1 in 2121; lawyers, 1 in 2700. In respect of classes, 40.7 per cent. of the aggregate population belong to the "peasants," 20.0 are *myeshchane* (burgesses) and artisans, 12.3 are "nobles," 2.4 "merchants," and 8.1 foreigners. The various religions are represented by 84.9 per cent. Orthodox Greeks, 9.9 Protestants, 3.3 Roman Catholics, and 1.9 various (16,826 Jews). On the whole, the Orthodox population are not great frequenters of the churches, which are far less numerous than in Moscow.

St Petersburg is well provided with scientific and educational institutions, as also with libraries and museums. The intellectual life of the educated classes is vigorous, and, although 36 per cent. of the population above six years old are unable to read, the workmen must be counted among the most intelligent classes in Russia. Notwithstanding the hardships and prosecutions it is periodically subjected to, the university exercises a pronounced influence on the life of St Petersburg. In 1882 it had eighty professors and 2165 students (968 in physics and mathematics, 776 in law). The medical faculty forms a separate academy, under military jurisdiction, with about 1500 students. There are, moreover, a philological institute, a technological institute, a forestry academy, an engineering academy, two theological academies (Greek and Roman Catholic),

an academy of arts, five military academies, a high school of law and a lyceum. Higher instruction for women is represented by a medical academy (now ordered to be closed), by a free university with 914 students in 1882, the standards of instruction and examination in both being equal to those of the other universities, and by higher pedagogical courses. For secondary education there are twelve classical gymnasia for boys and nine for girls, with four private gymnasia and three progymnasia, eight "real schools," five seminaries for teachers, ten military schools, three German gymnasia, and five other schools. For primary education there are 156 municipality schools (7225 scholars in 1883), 16 schools of the *zemstvo*, and about 450 others maintained either by public institutions or by private persons; 19,400 boys and girls received instruction in 431 public schools in 1884, the aggregate cost being £24,765; about 70 institutions for receiving the younger children of the poorer classes and several private "kindergartens" must be added to the above. The scientific institutions are numerous. The academy of sciences, opened in 1726, has rendered immense service in the exploration of Russia.² The oft-repeated reproach that it keeps its doors shut to Russian *savants*, while opening them too widely to German ones, is not without foundation; but the services rendered to science by the Germans in connexion with the academy are undoubtedly very great. The Pulkova astronomical observatory, the chief physical (meteorological) observatory (with branches throughout Russia and Siberia), the astronomical observatory at Vilna, the astronomical and magnetical observatory at Peking, and the botanical garden,³ all attached to the academy of sciences, issue every year publications of the highest scientific value. The Society of Naturalists and the Physical and Chemical Society, though less than twenty years old, have already issued most valuable publications, which are not so well known abroad as they deserve to be. The still more recently founded geological committee is ably pushing forward the geological survey of the country; the Mineralogical Society was founded in 1817. The Geographical Society, with four sections (923 members) and branch societies for West and East Siberia, Caucasus, Orenburg, the north-western and south-western provinces of European Russia, all liberally aided by the state, is well known for its valuable work, as is also the Entomological Society. There are four medical societies, and an Archaeological Society (since 1846), an Historical Society, an Economical Society (120 years old), Gardening, Forestry, Technical, Navigation Societies, and others, as also several scientific committees appointed at the ministries. The scientific work of the hydrographical department and of the general staff is well known. On the whole, there is access to all these societies, as well as to their museums and libraries. At St Petersburg classical music always finds first-rate performers and attentive hearers. The conservatory of music gives a superior musical instruction. The Musical Society is also worthy of notice. Art, on the other hand, has not freed itself from the old scholastic methods at the academy. Several independent artistic societies seek to remedy this drawback, and are the true cradle of the Russian *genre* painters.

The imperial public library, open free for 347 days in the year, though far behind the British Museum and the Bibliothèque Nationale in the number of volumes, nevertheless contains rich collections of books and MSS. Its first nucleus was the library of the Polish republic seized in 1795 (262,640 volumes and 24,574 prints), collected mostly by Archbishop Żaluski of Kieff. It has been much enriched since then by purchases and donations, and now (1886) contains more than 1,000,000 volumes, a remarkable collection of 50,000 "Rossica" (everything published in Russia), and 40,000 MSS., some of which are very valuable and unique. The library of the academy of sciences, also open every day, contains more than 500,000 volumes, 13,000 MSS., rich collections of works on Oriental languages, and valuable collections of periodical publications from scientific societies throughout the world. The library of the council of state is also open to the public; while several libraries of scientific societies and departments of the ministries, very rich in their special branches, are easily accessible. Those of the hydrographical department, the academy of art, the musical conservatory, the university (150,000 vols.), are especially valuable to the student. Nearly thirty private circulating libraries, which have to contend with many restrictions, supply the students for a small fee with everything printed in Russia, if not prohibited by Government. The museums of the Russian capital have a marked place among those of Europe. That of the academy of science, with more than 100,000 systematically classified natural history specimens; that of the Mineralogical Society, giving a full picture of the geology of Russia; the Asiatic museum, with its rich collections of Asiatic MSS. and coins; and several others are of great scientific value. The Hermitage Art Gallery contains a first-rate collection of the Flemish school, some pictures of the Russian school (the remainder being at the academy of arts), some good specimens of the

¹ Full mortality tables according to the separate diseases are given in the *Statistical Yearbook*. Very careful researches into the sanitary conditions of the city are given in the now suppressed *Sbornik Sudebnoi Meditsiny* (Mag. of Med. Jurisprudence) and *Zdorovye* (Health).

² Sukhomlinoff, "History of the Academy of Sciences," in its *Memoires* (Russian), vol. xxvi., 1876, and the same year in its *Memoires* in German.

³ Trautvetter, "History of the Botanical Garden," in *Memoirs* of the same, 1879, vol. ii.

Italian, Spanish, and old French schools, and especially invaluable treasures of Greek and Scythian antiquities, as also a good collection of 200,000 engravings. The old Christian and old Russian arts are well represented at the museum of the academy of arts. Besides these there are many other museums—pedagogical, medical, engineering, agricultural, forestry, marine, technical.

The press is represented by about 120 periodicals, including those of the scientific societies; the right of publishing political papers is a monopoly in the hands of the very few editors who are able to procure the necessary authorization. The publication of literary and scientific works, after having developed rapidly in 1859-69, is now greatly on the decrease owing to the oppressive measures of the censorship. In the development of the Russian drama St Petersburg has played a far less important part than Moscow, and the stage at St Petersburg has never reached the same standard of excellence as that of the older capital. On the other hand, St Petersburg is the cradle of Russian opera and Russian music. There are only four theatres of importance at St Petersburg—all imperial—two for the opera and ballet, one for the native drama, and one for the French and German drama.

St Petersburg is much less of a manufacturing city than Moscow or Berlin. The annual production of all the manufactures in the government of St Petersburg, chiefly concentrated in or around the capital, was in 1879 valued at £16,768,600 out of £110,294,900 for the empire, against £19,500,000 in the government of Moscow. The chief manufactured goods are cottons (£3,073,000) and other textile fabrics (altogether £3,762,500), machinery (£2,355,800), rails (£1,342,300), tobacco and spirits (about £1,200,000 each), leather, sugar, stearine candles, copper and gum wares (from £850,000 to £450,000 each), and a variety of smaller articles. The minor trades are greatly developed. No exact statistics of the internal trade can be given, except for the import and export of articles of food. In 1883 31,176,000 cwts. of grain and flour were imported by rail or river, of which 18,680,450 were re-exported and 2,809,900 sent to the interior. The exports in 1882 were valued at £1,864,980 from St Petersburg and at £6,557,017 from Cronstadt, the aggregate thus being £8,421,997, in which articles of food, chiefly corn, represented £4,214,812, raw and half raw produce £4,009,446, and manufactured wares £197,520. The value of the imports was—to St Petersburg £8,616,883 and to Cronstadt £116,316. Among the total imports articles of food were valued at £1,941,393, raw and half raw produce at £4,009,090 (chiefly coal), and manufactured wares at £1,082,698. Cronstadt and St Petersburg were visited in the same year by 2195 ships of 951,000 tons (730 ships, 152,730 tons, from Great Britain). The coasting trade was represented by 702 vessels (119,300 tons) entered. The commercial fleet numbered only 43 steamers (14,000 tons) and 49 sailing vessels (8200 tons).

Six railways meet at St Petersburg. Two run westwards along both banks of the Gulf of Finland to Hangöudd and to Port Baltic; two short lines connect Oranienbaum, opposite Cronstadt, and Tsarskoye Selo (with Pavlovsk) with the capital; and two great trunk-lines run south-west and south-east to Warsaw (with branches to Riga and Smolensk) and to Moscow (with branches to Novgorod and Rybinsk). All are connected in the capital, except the Finland Railway, which has its station on the right bank of the Neva. Moreover, the Neva is the great channel for the trade of St Petersburg with the rest of Russia, by means of the Volga and its tributaries. The importance of the traffic may best be seen from the following figures, showing in cwts. the amount imported by different channels:—

	Corn and flour.	Firewood.	All kinds of wares.
Neva	11,061,000	20,891,000	59,331,000
Baltic Railway	311,000	801,000	8,532,000
Moscow Railway	12,558,000	482,000	21,056,000
Warsaw Railway	812,000	157,000	2,353,000

No less than 1,162,230 pieces together with 7,337,000 cwts of timber were supplied in the same year *via* the Neva. The aggregate exports by rail and the Neva amounted to 11,382,000 cwts.

The average income of the St Petersburg municipality was £581,425 in 1880-82 (£577,856 in 1884),—that is, 13·7s. (6·84 roubles) per inhabitant, as against 35·8s. at Berlin and 98·2s. at Paris. The indirect taxes yield but 1s. per inhabitant (57s. at Paris). The average expenses for the same years reached £574,479 (£572,162 in 1884), distributed as follows:—20 per cent. of the whole for the police (10 at Paris and 27·5 at Berlin), 8 for administration, 16 for paving, 7 for lighting, 5 for public instruction, 2·6 for charity, and 3 for the debt (7 at Berlin and 37 at Paris). The municipal affairs are in the hands of a municipality, elected by three categories of electors (see RUSSIA), and is practically a department of the chief of the police. The city is under a separate governor-general, whose authority, like that of the chief of police, is all the more unlimited since it has not been accurately defined by law.

St Petersburg is surrounded by several fine residences, mostly imperial palaces with large and beautiful parks. Tsarskoye Selo, 16

miles to the south-east, and Peterhof, on the Gulf of Finland, are summer residences of the emperor. Pavlovsk has a fine palace and parks, open to the public, where summer concerts attract thousands of people. Oranienbaum is now a rather neglected place. Pulkova, on a hill 5 miles from St Petersburg, is well known for its observatory; while several villages north of the capital, such as Pargolovo, Murino, &c., are visited in summer by the less wealthy inhabitants.

History.—The region between Lake Ladoga and the Gulf of Finland was inhabited in the 9th century by Finns and some Slavonians. Novgorod and Pskoff made efforts to retain their dominion over this region, so important for their trade, and in the 13th and 14th centuries they built the forts of Koporye (in the present district of Peterhof), Yam (now Yamburg), and Oryeshek (now Schlüsselburg) at the point where the Neva issues from Lake Ladoga. They found, however, powerful opponents in the Swedes, who erected the fort of Landskrona at the junction of the Okhta and the Neva, and in the Livonians, who had their fortress at Narva. Novgorod and Moscow successively were able by continuous fighting to maintain their supremacy over the region south of the Neva throughout the 16th century; but early in the 17th century Moscow was compelled to cede it to Sweden, which erected a fortress (Nyönschanz) on the Neva at the mouth of the Okhta. In 1700 Peter I. began his wars with Sweden. Oryeshek was taken in 1702, and next year Nyönschanz. Two months later (29th June 1703) Peter I. laid the foundations of a cathedral to St Peter and St Paul, and of a fort which received his own name (in its Dutch transcription, "Piterburgh"). Next year the fort of Cronslott was erected on the island of Kotlin, as also the admiralty on the Neva, opposite the fortress. The emperor took most severe and almost barbarous measures for increasing his newborn city. Thousands of people from all parts of Russia were removed thither and died in erecting the fortress and building the houses. Great numbers of artisans and workmen were brought to St Petersburg to form the Myeshchanskaya villages, which raised the population to 100,000 inhabitants. All proprietors of more than "500 souls" were ordered to build a house at St Petersburg and to stay there in the winter. The construction of stone-houses throughout the rest of Russia was prohibited, all masons having to be sent to St Petersburg. After Peter I.'s death the population of the capital rapidly decreased; but foreigners continued to settle there. Under Elizabeth a new series of compulsory measures raised the population to 150,000, which figure was nearly doubled during the reign of Catherine II. Since the beginning of the present century the population has steadily increased (364,000 in 1817, 468,600 in 1837, 491,000 in 1856, and 667,000 in 1869). The chief embellishments of St Petersburg were effected during the reigns of Alexander I. (1801-25) and Nicholas I. (1825-55).

When Peter I., desirous of giving a "European" capital to his empire, laid the first foundations of St Petersburg on the marshy islands of the Neva, in land not fully conquered and remote from the centres of Russian life, it is hardly possible that he could have foreseen the rapid development it has since undergone: it has now a population approaching a million and commands more than one-sixth of the foreign trade and manufactures of Russia. In point of fact, there is no capital in Europe so disadvantageously situated with regard to its own country as St Petersburg. Desolate wildernesses begin at its very gates and extend for hundreds of miles to the north and east. To the south it has the very thinly peopled regions of Pskoff and Novgorod,—the marshy and woody tracts of the Valdai Heights. For 400 miles in each of these three directions there is not a single city of any importance; and towards the west, on both shores of the Gulf of Finland, are foreign peoples who have their own centres of gravitation in cities on or nearer to the Baltic. With the provinces of Russia the capital is connected only by canals and railways, which have to traverse vast tracts of inhospitable country before reaching them. But St Petersburg possesses, on the other hand, one immense advantage in its site, which has proved of great moment, especially in the present century of development of international traffic. Ruled by the idea of creating a new Amsterdam—that is, a meeting-place for traders of all nationalities—and a great export market for Russia, Peter I. could have selected no better place. St Petersburg has been for nearly 150 years the chief place of export for raw produce from the most productive parts of Russia. The great central plateau which forms the upper basins of all the chief Russian rivers had no other outlet to the sea than the estuary of the Neva. The natural outlet might indeed have been the Black Sea; but the rivers to the southward are either interrupted by rapids like the Dnieper, or are shallow like the Don; while their mouths and the entire coast-region remained till the end of the 18th century in the hands of Turkey. As for the Caspian, it faced Asia, and not Europe. The commercial outlet of the central plateau was thus the reverse of the physical. From the earliest years of Russian history trade had taken this northern direction. Novgorod owed its wealth to this fact; and as far back as the 12th century the Russians had their forts on Lake Ladoga and the Neva. In the 14th and 15th centuries they already exchanged their wares with the Dantzic merchants at Nu or Nü,—

the then name for what is now Vasilyevskiy Island. By founding St Petersburg Peter I. only restored the trade to its old but discarded channels. The system of canals for connecting the upper Volga and the Dnieper with the great lakes of the north completed the work; the commercial mouth of the Volga was transferred to the Gulf of Finland, and St Petersburg became the export harbour for more than half Russia. Foreigners hastened thither to take possession of the growing export trade, to the exclusion of the Russians; and to this circumstance the Russian capital is indebted for its cosmopolitan character. But its present extensive and west-European aspect has not been achieved, nor is it maintained, without a vast expenditure of the national resources. It cost hundreds of thousands of human lives before the marshy islands at the mouth of the Neva could be rendered fit to receive a million inhabitants and be brought into connexion with the remainder of Russia; and very many more are annually sacrificed for the maintenance of this capital on its unhealthy site, under the 60th parallel, hundreds of miles distant from the centres of Russian life.

The development of the railway system and the rapid colonization of southern Russia now operate, however, adversely to St Petersburg. Its foreign trade is not actually decreasing, but the very rapid growth in the exports of Russia within the twenty years before 1886 was entirely to the benefit of other ports more highly favoured by nature, such as Riga and especially Libau, while the rapid increase of population in the Black Sea region is tending to shift the Russian centre of gravity: new centres of commercial, industrial, and intellectual life are being developed at Odessa and Rostoff. The revival of Little Russia is another influence operating in the same direction.

Another important factor in the growth of the influence of St Petersburg on Russian life was the concentration of all political power in the hands of an absolute Government and in the narrow circles surrounding the chief of the state. As Yuri Dolgorukiy felt the necessity of creating for a new phase of national history—that of a centralized state—a new capital, Moscow, free from the municipal and republican traditions of the old Russian towns, so Peter I. felt the necessity of again creating a fresh capital for a third phase of the country's progress,—a capital where the rising imperial power would be free from the control of the old boyar families. St Petersburg fully answers to this need. For more than a century and a half it was the real centre of political life and of political thought, impregnated with the conception of a powerful central Government. In so strongly centralized a state as Russia was, and still is, and for the phase of life which the empire has passed through during the last two centuries, it mattered little whether the capital was some hundred miles away from the natural centres of life and without the support of a dense and active surrounding population. Bureaucracy, its leading feature, was simply reinforced by the remoteness of the capital. But these circumstances are at present undergoing a change. Since the abolition of serfdom and in consequence of the impulse given to Russian thought by this reform, the provinces are coming more and more to dispute the right of St Petersburg to guide the political life of the country. It has been often said that St Petersburg is the head of Russia and Moscow its heart. The first part at least of this saying is true. In the development of thought and in naturalizing in Russia the results of west European reflection St Petersburg has played throughout the present century a prominent part. Attracting to itself from the provinces the best intellects of the country, it has powerfully contributed towards familiarizing the reading public with the teachings of west European science and philosophy, and towards giving to Russian literature that liberality of mind and freedom from the trammels of tradition that have so often been noticed by west Europeans. St Petersburg has no traditions, no history beyond that of the palace conspiracies, and nothing in its past can attract the writer or the thinker. But, as new centres of intellectual movement and new currents of thought develop again at Moscow and Kieff or arise anew at Odessa and in the eastern provinces, these places claim the right to their own share in the further development of intellectual life in Russia; and it would not be surprising if the administrative and intellectual centre of the empire, after its migrations successively from Kieff, Novgorod, and Pskoff to Moscow, and thence to St Petersburg, were again to follow a new movement towards the south.

ST PIERRE. See RÉUNION, vol. xx. p. 493.

ST PIERRE. See MARTINIQUE, vol. xv. p. 586.

SAINT-PIERRE, CHARLES IRÉNÉE CASTEL, ABBÉ DE (1658-1743), a French writer of much ingenuity and influence, who is not unfrequently confounded with the author of *Paul et Virginie*, was born near Barfleur on the 18th of February 1658. His father was bailli of the Cotentin, and Saint-Pierre, who was educated by the Jesuits, appears to have had an easy entrance to the best literary and political society of the capital. He was presented to the

abbacy of Tours, which a century before the poet Desportes had held, and was elected to the Academy in 1695. But in 1718, in consequence of the political offence given by his *Polysynodie*, he suffered the very rare penalty of expulsion from that body. He died at Paris in 1743.

Saint-Pierre's works (collected shortly before his death in eighteen volumes and originally published chiefly in the second and third decades of the 18th century) are almost entirely occupied with an acute and inventive, though generally visionary, criticism of politics, law, and social institutions. They had a great influence on Rousseau, who has left elaborate examinations of some of them, and has reproduced not a few of their ideas in his own work. The titles are almost sufficient to show their nature. The chief are *Projet de Paix Perpetuelle* (appositely published at Utrecht in 1713) and *Poly-synodie* (a severe stricture on the Government of Louis XIV., with projects for the administration of France by a system of councils for each department of government), together with a crowd of memorials and projects for stopping duelling, for equalizing taxation, for treating mendicancy, for reforming education and spelling, &c. Unlike the later reforming abbés of the *philosophe* period, Saint-Pierre was a man of very unworldly character and quite destitute of the Frondeur spirit. He was also a man of not a little intellectual power, and, as in the case of every such man who gives his fancy free course in the construction of political Utopias, not a few of his wishes and ideas have been realized in course of time. But it is difficult to give him much credit for practical grasp of politics.

SAINT-PIERRE, JACQUES HENRI BERNARDIN DE (1737-1814), French man-of-letters, was born at Havre on 19th January 1737 and was educated at Caen. After a fashion commoner with English than with French boys, he took an early fancy to the sea, and his uncle, a ship captain, gave him the opportunity of gratifying it. But a single voyage to Martinique was enough for him and he went back to school. He next wanted to be a missionary; but his parents, who had probably taken the measure of his enthusiasms from his sea experiences, objected, and he became an engineer. He served in the army, but was dismissed for insubordination, and, after quarrelling with his family, was in some difficulty. But in 1761 he obtained an appointment at Malta, which also he did not hold long. The most rolling of stones, he appears at St Petersburg, at Warsaw, at Dresden, at Berlin, holding brief commissions as an engineer and rejoicing in romantic adventures. But he came back to Paris at the age of thirty even poorer than he set out. He then passed two years in literary work, supporting himself in an unknown fashion, and in 1768 (for he seems to have been as successful in obtaining appointments as in losing them) he set out for the Isle of France (Mauritius) with a Government commission and remained there three years, returning home in 1771. These wanderings supplied Bernardin with the whole of what may be called his stock-in-trade, for, though he lived more than forty years longer, he never again quitted France. He was very poor, and indeed it is not easy to discover from his biographers what he lived upon, for, though he was an unwearied solicitor of employments and "gratifications," he received but little, and his touchy and sensitive temperament frequently caused him to quarrel with what little he did receive. On his return from Mauritius he was introduced to the society of D'Alembert and his friends, and continued to frequent it. But he took no great pleasure in the company of any literary man except Rousseau, of whom in Jean Jacques's last years he saw much, and on whom he formed both his own character and still more his style to a considerable degree. His first work of any importance, the *Voyage à l'Île de France*, appeared in 1773 and gained him some reputation. It is the soberest and therefore the least characteristic of his books. The *Études de la Nature*, which made his fame and assured him of literary success, did not appear till ten years later, his masterpiece *Paul et Virginie* not till 1787, and his other masterpiece (which, as much less sentimental and showing not a little humour, some persons may be allowed to prefer), the *Charmière Indienne*, not till 1790. In 1792 he married

a very young girl, Félicité Didot. For a short time in 1792 he was superintendent of the Jardin des Plantes and again for a short time professor of morals at the École Normale in 1794. Next year he became a member of the Institute. After his first wife's death he married, in 1800, when he was sixty-three, another young girl, Désirée de Pelleport, and is said to have been very happy with her. He still continued to publish, and was something of a favourite with Napoleon. On the 21st of January 1814 he died at Éragny near Pontoise, where he had in his last years chiefly lived and where he had a house, so that he cannot have been ill off.

It has been hinted that Bernardin de Saint-Pierre's personal character was not entirely amiable; it may be added that his literary character has not in all English eyes sufficed to atone for it. Englishmen, and not Englishmen only, have been found to pronounce *Paul et Virginie* gaudy in style and unhealthy, not to say unwholesome, in tone. Perhaps Bernardin is not fairly to be judged by this famous story, in which the exuberant sensibility of the time finds equally exuberant expression. The *Chaumière* and some passages in the *Études de la Nature* proper may be thought to exhibit the real merits of his style to greater advantage. The historic estimate (the sole estimate that is of much worth in comparative literary criticism) at once disengages the question from its difficulties. Where Bernardin is of merit and importance is in his breaking away from the dull and arid vocabulary and phrase which more than a century of classical writing had brought upon France, in his genuine and vigorous preference of the beauties of nature to the mere charms of drawing-room society, and in the attempt which he made, with as much sincerity as could fairly be expected from a man of his day, to reproduce the aspects of the natural world faithfully. After Rousseau, and even more than Rousseau, Bernardin was in French literature the apostle of the return to nature, and, though in him and his immediate follower, Chateaubriand, there is still much mannerism and unreality, he should not and will not lack the credit due.

Aimé Martin, disciple of Bernardin and the second husband of his second wife, published a complete edition of his works in 18 volumes (Paris, 1818-20), afterwards increased by additional correspondence, &c. *Paul et Virginie*, the *Chaumière Indienne*, &c., have been separately reprinted in innumerable forms.

ST PIERRE AND MIQUELON, two islands 10 miles off the south coast of Newfoundland (see vol. xvii. pl. V.), at the entrance of Fortune Bay, are, with five lesser islets, the last remnant of the North American colonies of France. Both are rugged masses of granite, with a few small streams and lakelets, a thin covering of soil, and scanty vegetation. Miquelon (area, 45,542 acres) consists of Great Miquelon in the north and Little Miquelon, Langlade, or Langley in the south; previous to 1783 they were separate islands divided by a navigable channel, but they have since become connected by a dangerous sandbar. St Pierre (6420 acres) has a good harbour and roadstead, the latter, protected by Île aux Chiens, affording shelter, except in north-east storms, to the largest vessels. The small but busy town of St Pierre climbing the steep hill above the harbour is mainly built of wood; but it has a cathedral (of wood), an English chapel, a governor's residence, and various administrative offices, including the American terminus of the French Atlantic cable. Cod-fishing, to which the settlement owes its prosperity, was prosecuted in the five years 1878-82, on an average, by 4560 fishermen (mainly from Dunkirk and other French ports), and produced 3876 tons of dried and 157,754 tons of undried cod, with 450 tons of cod-liver oil. The total exports and imports were valued, respectively, at 9,218,278 and 4,441,817 francs in 1865, and 17,164,153 and 11,062,617 francs in 1883. The foreign trade in 1883 was valued at 10,218,473 francs. The population of the islands was 5564 (town of St Pierre 4365) in 1883; but the number is often above 10,000 in the fishing-season.

St Pierre and Miquelon, with 3000 inhabitants, were ceded to England along with Newfoundland in 1713; but on the English conquest of Canada they were assigned to France as a fishery dépôt. Destroyed by the English in 1778, restored to France in 1783, again depopulated by the English in 1793, recovered by France in 1802 and lost in 1803, the islands have remained an undisputed French possession since 1816.

ST PIERRE-LÈS-CALAIS, a suburb of CALAIS (q.v.), with a population of 30,786 in 1881.

ST POL DE LÉON, a town of France, in the arrondissement of Morlaix and department of Finistère, not far from the shores of the English Channel, 13½ miles north-west of Morlaix by the railway to Roscoff. This quiet episcopal city, old but modernized, is mainly of interest on account of its cathedral and the church of Notre Dame, though it also contains an episcopal palace (1712-50), a seminary (1691), and a hospital (1711). The cathedral, classed as an historical monument, belongs largely to the 13th century. Besides the west front, with its portico and its two towers with granite spires 180 feet high, the principal points of architectural interest are the traceried window of the south transept (with its glass) and the rectangular apse, and in the interior the stalls of the choir (16th century) and the fascicled pillars and vault-arches of the nave. On the right of the high altar is a wooden shrine containing the bell of St-Pol de Léon (6 lb 10 oz. in weight), which has the repute of curing headache and diseases of the ear, and at the side of the main entrance is a huge baptismal font, popularly regarded as the stone coffin of Conan Mériadec, king of the Bretons. Notre Dame de Creizker has a 15th-century spire, 252 feet high, which crowns the central tower. The north porch is a fine specimen of the flamboyant style. The population of the town in 1881 was 3739 and of the commune 6659.

St Pol de Léon, or *Fanum Sancti Pauli Leonini*, was formerly a place of considerable importance. The barony of Léon, in the possession of the dukes of Rohan, gave them the right of presiding in the provincial states alternatively with the duke of La Trémouille, baron of Vitré.

ST QUENTIN, a manufacturing town of France, the chef-lieu of an arrondissement and in population (45,697 in 1881) the largest town in the department of Aisne, stands on the right bank of the Somme, at the junction of the Somme Canal with the St Quentin Canal (which unites the Somme Canal with the Scheldt), 95½ miles north-east of Paris by the railway to Brussels and Cologne, with branch lines to Guise (on the Oise) and Epéhy on the Flanders and Picardy railway. Built on a slope, with a southern exposure, the town is crowned by the collegiate church of St Quentin, one of the finest Gothic buildings of the north of France, which was erected between 1114 and 1477, and has, like some English cathedrals, the somewhat rare peculiarity of double transepts. The length of the church is 436 feet and the height of the nave 131. The magnificent clerestory windows are supported by a very elegant triforium. The baptismal chapel contains a fine stone retable. The choir has a great resemblance to that of Rheims, and, like the chapels of the apse, has been decorated with polychromic paintings. Under the choir is a crypt occupying the site of an older crypt constructed in the 9th century, of which only the three vaults with the tombs of St Quentin and his fellow-martyrs remain. The town-house of St Quentin is a splendid building of the 15th and 16th centuries, with a flamboyant façade, adorned with curious sculptures. Behind the central gable rises a bell-tower with chimes. The council-room is a fine hall with a double wooden ceiling and a huge chimneypiece half Gothic half Renaissance. The old buildings of the Bernardines of Fervagues now provide accommodation for the courts, the learned societies, the school of design, the museum, and the library, and contain a large hall for public meetings. St Quentin is the centre of an industrial district which employs 130,000 workmen in 800 factories, and manufactures the fortieth part of the cotton imported into France, producing goods to the value of about £3,500,000, mainly calicoes, percales (glazed cottons), cretonnes, jaconas, twills, piqués, muslins, cambrics, gauzes, wool-muslins, Scotch cashmeres, and merinos. Other in-

dustries are the making of embroideries by machinery and by hand, turning billiard-balls, and engine-building.

St Quentin, the *Augusta Vermanduorum* of the Romans, stood at the meeting-place of five roads of military importance. In the 3d century it was the scene of the martyrdom of Caius Quintinus, who had come as a preacher of Christianity, and in the reign of Dagobert the martyr's tomb became under the influence of St Eloi a place of pilgrimage. After it had been thrice ravaged by the Normans the town was surrounded by walls in 883. It became under Pippin, grandson of Charlemagne, one of the principal domains of the county of Vermandois, and in 1103 was constituted a commune. In 1195 it was incorporated with the royal domain and about the same time received an increase of its privileges. From 1420 to 1471 St Quentin was occupied by the Burgundians. Its capture by the Spaniards on the day of St Lawrence, 1557, was the success which Philip II. of Spain commemorated by building the Escorial. Two years later the town was restored to the French, and in 1560 it was assigned as the dowry of Mary Stuart. The fortifications erected under Louis XIV. were demolished between 1810 and 1820. During the Franco-Prussian War St Quentin repulsed the German attacks of 8th October 1870; and on 19th January 1871 it was the centre of the great battle fought by General Faidherbe, one of the last episodes of the campaign.

ST SEBASTIAN. See SAN SEBASTIAN.

ST SERVAN, a cantonal town of France, in the department of Ille-et-Vilaine, on the right bank of the Rance to the south of St Malo, from which it is separated by a creek at least a mile wide (see ST MALO). In population (10,691 inhabitants in 1881; 12,867 in the commune) St Servan is slightly the smaller town of the two. It is not enclosed by walls, and with its new houses, straight wide streets, and numerous gardens forms quite a contrast to its neighbour. In summer it attracts a number of seaside visitors. The floating dock will when finished have an area of 27 acres and one mile of quays. The creek on which it opens is dry at low water, but at high water is 30 to 40 feet deep. Another port on the Rance, to the south-west of the town at the foot of the tower of Solidor, is used by the local guard-ship. This tower, erected in the close of the 14th century by Duke John IV. for the purpose of contesting the claims of Josselin de Rohan, bishop of St Malo, to the temporal sovereignty of the town, consists of three distinct towers formed into a triangle by loop-holed and machicolated curtains. At the north-west point of St Servan stands the "city fort" and near by are the ruins of the cathedral of St Peter of Aleth, the seat of a bishopric from the 6th to the 12th century. The church is modern (1742-1842).

The northern quarter of St Servan, called "the City," occupies the site of the city of Aleth, which at the close of the Roman empire supplanted Corseul as the capital of the Curiosolites. Aleth was a bulwark of Druidism in those regions and was not Christianized till the 6th century, when St Malo became its first bishop. On the removal of the bishopric to St Malo Aleth declined; but the houses that remained standing became the nucleus of a new community, which placed itself under the patronage of St Servan, apostle of the Orkneys. In 1758 the place was occupied by Marlborough. It was not till 1789 that St Servan became a separate commune from St Malo with a municipality and police of its own.

SAINT-SIMON, CLAUDE HENRI, COMTE DE (1760-1825), the founder of French socialism, was born at Paris on 17th October 1760. He belonged to a younger branch of the family of the celebrated duke of that name. His education, he tells us, was directed by D'Alembert. At the age of nineteen he went as volunteer to assist the American colonies in their revolt against Britain. From his youth Saint-Simon felt the promptings of an eager ambition. His valet had orders to awake him every morning with the words, "Remember, monsieur le comte, that you have great things to do"; and his ancestor Charlemagne appeared to him in a dream foretelling a remarkable future for him. Among his early schemes was one to unite the Atlantic and the Pacific by a canal, and another to construct a canal from Madrid to the sea. He took no part of any importance in the Revolution, but amassed a little fortune by land speculation,—not on his own account,

however, as he said, but to facilitate his future projects. Accordingly, when he was nearly forty years of age he went through a varied course of study and experiment, in order to enlarge and clarify his view of things. One of these experiments was an unhappy marriage, which, after a year's duration, was dissolved by the mutual consent of the parties. Another result of his experiments was that he found himself completely impoverished, and lived in penury for the remainder of his life. The first of his numerous writings, *Lettres d'un Habitant de Genève*, appeared in 1803; but his early writings were mostly scientific and political. It was not till 1817 that he began in a treatise entitled *L'Industrie* to propound his socialistic views, which he further developed in *L'Organisateur* (1819), *Du Système Industriel* (1821), *Catéchisme des Industriels* (1823). The last and most important expression of his views is the *Nouveau Christianisme* (1825). For many years before his death in 1825 (at Paris on 19th May) Saint-Simon had been reduced to the greatest straits. He was obliged to accept a laborious post for a salary of £40 a year, to live on the generosity of a former valet, and finally to solicit a small pension from his family. In 1823 he attempted suicide in despair. It was not till very late in his career that he attached to himself a few ardent disciples.

As a thinker Saint-Simon was entirely deficient in system, clearness, and consecutive strength. But his great influence on modern thought is undeniable, both as the historic founder of French socialism and as suggesting much of what was afterwards elaborated into Comtism. Apart from the details of his socialistic teaching, which are vague, inconsistent, and unsystematic, we find that the ideas of Saint-Simon as to the reconstruction of society are very simple. His opinions were conditioned by the French Revolution and by the feudal and military system still prevalent in France. In opposition to the destructive liberalism of the Revolution he insisted on the necessity of a new and positive reorganization of society. So far was he from advocating fresh social revolt that he appealed to Louis XVIII. to inaugurate the new order of things. In opposition, however, to the feudal and military system, the former aspect of which had been strengthened by the restoration, he advocated an arrangement by which the industrial chiefs should control society. In place of the mediæval church the spiritual direction of society should fall to the men of science. What Saint-Simon desired, therefore, was an industrialist state directed by modern science. In short, the men who are fitted to organize society for productive labour are entitled to bear rule in it. The social aim is to produce things useful to life; the final end of social activity is "the exploitation of the globe by association." The contrast between labour and capital so much emphasized by later socialism is not present to Saint-Simon, but it is assumed that the industrial chiefs, to whom the control of production is to be committed, shall rule in the interest of society. Later on the cause of the poor receives greater attention, till in his greatest work, *The New Christianity*, it becomes the central point of his teaching and takes the form of a religion. It was this religious development of his teaching that occasioned his final quarrel with Comte. Previous to the publication of the *Nouveau Christianisme*, Saint-Simon had not concerned himself with theology. Here he starts from a belief in God, and his object in the treatise is to reduce Christianity to its simple and essential elements. He does this by clearing it of the dogmas and other excrescences and defects which have gathered round both the Catholic and Protestant forms of it, which he subjects to a searching and ingenious criticism. "The new Christian organization will deduce the temporal institutions as well as the spiritual from the principle that all

men should act towards one another as brethren." Expressing the same idea in modern language, Saint-Simon propounds as the comprehensive formula of the new Christianity this precept—"The whole of society ought to strive towards the amelioration of the moral and physical existence of the poorest class; society ought to organize itself in the way best adapted for attaining this end." This principle became the watchword of the entire school of Saint-Simon; for them it was alike the essence of religion and the programme of social reform.

During his lifetime the views of Saint-Simon had very little influence; and he left only a very few devoted disciples, who continued to advocate the doctrines of their master, whom they revered as a prophet. An important departure was made in 1828 by Bazard, who gave a "complete exposition of the Saint-Simonian faith" in a long course of lectures at Paris in the Rue Taranne. In 1830 Bazard and Enfantin were acknowledged as the heads of the school; and the fermentation caused by the revolution of July of the same year brought the whole movement prominently before the attention of France. Early next year the school obtained possession of the *Globe* through Pierre Leroux, who had joined the school, which now numbered some of the ablest and most promising young men of France, many of the pupils of the *École Polytechnique* having caught its enthusiasm. The members formed themselves into an association arranged in three grades, and constituting a society or family, which lived out of a common purse in the Rue Monsigny. Before long, however, dissensions began to arise in the sect. Bazard, a man of logical and more solid temperament, could no longer work in harmony with Enfantin, who desired to establish an arrogant and fantastic sacerdotalism with lax notions as to marriage and the relation of the sexes. After a time Bazard seceded and many of the strongest supporters of the school followed his example. A series of extravagant entertainments given by the society during the winter of 1832 reduced its financial resources and greatly discredited it in character. They finally removed to Menilmontant, to a property of Enfantin, where they lived in a communistic society, distinguished by a peculiar dress. Shortly after the chiefs were tried and condemned for proceedings prejudicial to the social order; and the sect was entirely broken up (1832). Many of its members became famous as engineers, economists, and men of business. The idea of constructing the Suez Canal, as carried out by Lesseps, proceeded from the school.

In the school of Saint-Simon we find a great advance both in the breadth and firmness with which the vague and confused views of the master are developed; and this progress is due chiefly to Bazard. In the philosophy of history they recognize epochs of two kinds, the critical or negative and the organic or constructive. The former, in which philosophy is the dominating force, is characterized by war, egotism, and anarchy; the latter, which is controlled by religion, is marked by the spirit of obedience, devotion, association. The two spirits of antagonism and association are the two great social principles, and on the degree of prevalence of the two depends the character of an epoch. The spirit of association, however, tends more and more to prevail over its opponent, extending from the family to the city, from the city to the nation, and from the nation to the federation. This principle of association is to be the keynote of the social development of the future. Hitherto the law of humanity has been the "exploitation of man by man" in its three stages, slavery, serfdom, the proletariat; in the future the aim must be "the exploitation of the globe by man associated to man." Under the present system the industrial chief still exploits the proletariat, the members of which, though nominally free, must accept his terms under pain of starvation. This state of things is consolidated by the law of inheritance, whereby the instruments of production, which are private property, and all the attendant social advantages are transmitted without regard to personal merit. The social disadvantages being also transmitted, misery becomes hereditary. The only remedy for this is the abolition of the law of inheritance, and the union of all the instruments of labour in a social fund, which shall be exploited by association. Society thus

becomes sole proprietor, intrusting to social groups and social functionaries the management of the various properties. The right of succession is transferred from the family to the state. The school of Saint-Simon insists strongly on the claims of merit; they advocate a social hierarchy in which each man shall be placed according to his capacity and rewarded according to his works. This is, indeed, a most special and pronounced feature of the Saint-Simon socialism, whose theory of government is a kind of spiritual or scientific autocracy, degenerating into the fantastic sacerdotalism of Enfantin. With regard to the family and the relation of the sexes the school of Saint-Simon advocated the complete emancipation of woman and her entire equality with man. The "social individual" is man and woman, who are associated in the exercise of the triple function of religion, the state, and the family. In its official declarations the school maintained the sanctity of the Christian law of marriage. On this point Enfantin fell into a prurient and fantastic latitudinarianism, which made the school a scandal to France, but many of the most prominent members besides Bazard refused to follow him. Connected with these doctrines was their famous theory of the "rehabilitation of the flesh," deduced from the philosophic theory of the school, which was a species of Pantheism, though they repudiated the name. On this theory they rejected the dualism so much emphasized by Catholic Christianity in its penances and mortifications, and held that the body should be restored to its due place of honour. It is a vague principle of which the ethical character depends on the interpretation; and it was variously interpreted in the school of Saint-Simon. It was certainly immoral as held by Enfantin, by whom it was developed into a kind of sensual mysticism, a system of free love with a religious sanction.

An excellent edition of the works of Saint-Simon and Enfantin was begun by survivors of the sect in Paris (1865), and now numbers forty vols. See Reybaud, *Études sur les Réformateurs modernes* (7th edition, Paris, 1884); Janet, *Saint-Simon et le Saint-Simonisme* (Paris, 1878); A. J. Booth, *Saint-Simon and Saint-Simonism* (London, 1871). (T. K.)

SAINT-SIMON, LOUIS DE ROUVRAY (or ROUVROY), DUC DE (1675-1755), was born at Versailles on 16th January 1675. He was the son of Claude de Saint-Simon, who represented a family which had been established for many centuries at La Ferté Vidame, between Mortagne and Dreux, and which claimed descent from Charlemagne. Claude de Saint-Simon had been a page of Louis XIII., and, gaining the king's favour as a sportsman, had received various preferments and was finally created *duc et pair*. This peerage is the central fact in Saint-Simon's history, and it is impossible to understand him without understanding it. To speak, as one of his few biographers in English has spoken, of "a young duke of recent creation," and of the apparent absurdity of such a young duke taking the aristocratic views which characterized Saint-Simon through life, is to show the most deplorable ignorance of the facts. The French peerage under the old *régime* was a very peculiar thing, difficult to comprehend at all, but quite certain to be miscomprehended if any analogy of the English peerage, such as is implied in the observation just quoted, is imported into the consideration. No two things could be more different in France than ennobling a man and making him a peer. No one was made a peer who was not ennobled, but men of the noblest blood in France and representing their houses might not be, and in most cases were not, peers. Derived at least traditionally and imaginatively from the *douze pairs* of Charlemagne, the peers were supposed to represent the chosen of the noblesse, and gradually, in an indefinite and constantly disputed fashion, became associated with the parlement of Paris as a quasi-legislative (or at least law-registering) and directly judicial body. But the peerage was further complicated by the fact that not persons but the holders of certain fiefs were made peers. Strictly speaking, neither Saint-Simon nor any one else in the same case was made a peer, but his estate was raised to the rank of a *duché pairie* or a *comté pairie* as the case might be. If all analogies were not deceptive, the nearest idea of a French peerage of the old kind may be obtained by an English reader if he takes the dignity of a Scotch or Irish representative peer, then supposes that dignity to be made hereditary, and then limits the heritableness of it not merely to descent

but to the tenure in direct succession of certain estates. It must of course be understood that the peers were not elected but nominated. Still they were in a way a standing committee representative of the entire body of nobles, and it was Saint-Simon's lifelong ideal and at times his practical effort to convert them into a sort of great council of the nation. These remarks are almost indispensable to illustrate his life, to which we may now return. His mother, Claude de Saint-Simon's second wife, was Charlotte de l'Aubespine, who belonged to a family not of the oldest nobility but which had been distinguished in the public service at least since the time of Francis I. Her son Louis was well educated, to a great extent by herself, and he had had for godfather and godmother no less persons than Louis XIV. and the queen. After some tuition by the Jesuits (especially by Sanadon, the editor of Horace), he betook himself in 1692, at the age of seventeen, to the career of arms, entering the *mousquetaires gris*. He was present at the siege of Namur, and next year his father died. He still continued in the army and was present at the battle of Neerwinden. But it was at this very time that he chose to begin the crusade of his life by instigating, if not bringing, an action on the part of the peers of France against Luxembourg, his victorious general, on a point of precedence. He fought, however, another campaign or two (not under Luxembourg), and in 1695 married Gabrielle de Durfort, daughter of the *maréchal de Lorges*, under whom he latterly served. He seems to have regarded her with a respect and affection not very usual between husband and wife at the time; and she sometimes succeeded in modifying his aristocratic crotchets. But as he did not receive the promotion he desired he flung up his commission in 1702. Louis, who was already becoming sensitive on the point of military ill-success, and who was not likely to approve Saint-Simon's litigiousness on points of privilege, took a dislike to him, and it was only indirectly and by means of establishing interest with the dukes of Burgundy and Orleans that he was able to keep something of a footing at court. He was, however, intensely interested in all the transactions of Versailles, and by dint of a most heterogeneous collection of instruments, ranging from dukes to servants, he managed to obtain the extraordinary secret information which he has handed down to us about almost every event and every personage of the last twenty years of the "grand monarque." His own part appears to have been entirely subordinate. He was appointed ambassador to Rome in 1705, but the appointment was cancelled before he started. At last he attached himself to the duke of Orleans and, though this was hardly likely to conciliate Louis's good will to him, it gave him at least (what was of the first importance in that intriguing court) the status of belonging to a definite party, and it eventually placed him in the position of tried friend to the acting chief of the state. He was able, moreover, to combine attachment to the duke of Burgundy with that to the duke of Orleans. Both attachments were no doubt all the more sincere because of his undying hatred to "the bastards," that is to say, the illegitimate sons of Louis XIV. It does not appear that this hatred was founded on moral reasons or on any real fear that these bastards would be intruded into the succession. The true cause of his wrath was that they had precedence of the peers.

The death of Louis seemed to give Saint-Simon a chance of realizing his hopes. The duke of Orleans was at once acknowledged regent and Saint-Simon was of the council of regency, but no steps were taken to carry out his favourite vision of a France ruled by the nobles for its good (it must always be understood that Saint-Simon's ideal was in no respect an aristocratic tyranny except of the beneficent kind), and he had little real influence with

the regent. He was indeed gratified by the degradation of "the bastards," and in 1721 he was appointed ambassador to Spain to arrange for the marriage (not destined to take place) of Louis XV. and the infanta. His visit was splendid; he received the *grandeeship*, and, though he also caught the smallpox, he was quite satisfied with the business. After his return he had little to do with public affairs. His own account of the cessation of his intimacy with Orleans and Dubois, the latter of whom had never been his friend, is, like his own account of some other events of his life, obscure and rather suspicious. But there can be little doubt that he was practically ousted by the favourite. He survived for more than thirty years; but little is known of his life. His wife died in 1743, his eldest son a little later; he had other family troubles, and he was loaded with debt. When he died, at Paris on 2d March 1755, he had almost entirely outlived his own generation (among whom he had been one of the youngest) and the prosperity of his house, though not its notoriety. This last was in strange fashion revived by a distant relation born five years after his own death, Claude Henri, Comte de Saint-Simon, the subject of the preceding article.

It will have been observed that the actual events of Saint-Simon's life, long as it was and high as was his position, are neither very numerous nor very noteworthy. If nothing more had been known about him than was known at the time of his death he would certainly not have deserved mention at length here. Saint-Simon is, however, an almost unique example of a man who has acquired great literary fame entirely by posthumous publications. He was an indefatigable writer, and not merely from the time he left the army but much earlier he began to set down in black and white all the gossip he collected, all his interminable legal disputes of precedence, and a vast mass of unclassified and almost unclassifiable matter. Most of his manuscripts came into the possession of the Government, and it was long before their contents were published in anything like fulness. Extracts and abstracts, however, leaked out and parts of the manuscript were sometimes lent to privileged persons, so that some notion of the unique value of Saint-Simon got abroad within twenty or thirty years of his death. Partly in the form of notes on Dangeau's *Journal*, partly in that of original and independent memoirs, partly in scattered and multifarious tracts and disquisitions, he had committed to paper an amount of matter which has probably never been exceeded by any one except a professional journalist, if indeed the parallel will hold even there. The new edition now publishing of the *Memoirs* with the notes on Dangeau is estimated to contain thirty large octavo volumes. Besides this, M. Drumont, M. Faugère, and other independent workers are bringing out series of *Œuvres Inédites* of a less gossiping and more technical character found in different receptacles of the public archives. But the mere mass of these productions is their least noteworthy feature, or rather it is most remarkable as contrasting with their character and style. The voluminous writer is usually thought of as least likely to be characterized by an original and sparkling style. Saint-Simon, though careless and sometimes even ungrammatical, ranks among the most striking memoir writers of France, the country richest in memoirs of any in the world. His pettiness, his absolute injustice to his private enemies and to those who espoused public parties with which he did not agree, the bitterness which allows him to give favourable portraits of hardly any one, his omnivorous appetite for gossip, his lack of proportion and perspective, are all lost sight of in admiration of his extraordinary genius for historical narrative and character-drawing of a certain sort. He has been compared to Tacitus, and for once the comparison, so often made and generally so ludicrously out of place, is just. In the midst of his enormous mass of writing phrases scarcely inferior to the Roman's occur frequently, and here and there passages of sustained description equal for intense concentration of light and life to those of Tacitus or of any other historian. As may be expected from the vast extent of his work, it is in the highest degree unequal. But he is at the same time not a writer who can be "sampled" easily, inasmuch as his most characteristic phrases sometimes occur in the midst of long stretches of quite uninteresting matter. Hence he has been even since his discovery more praised than read, and better liked by critics than by the general reader. A few critical studies of him, especially those of Sainte-Beuve, are in fact the basis of much, if not most, that has been written about him. Yet no one is so little to be taken at second-hand. Even his most famous passages, such as the account of the death of the dauphin or of the bed of justice where his enemy the duke of Maine was degraded, will not give a fair idea of his talent. These are his gallery pieces,

his great "machines," as French art slang calls them. Much more noteworthy as well as more frequent are the sudden touches which he gives. The bishops are "cuistres violets"; M. de Caumartin "porte sous son manteau toute la fatuité que M. de Villeroy étale sur son baudrier"; another politician has a "mine de chat fâché"; a third is hit off as "comptant faire" ("he would still be doing," though Saint-Simon certainly did not know that phrase). In short, the interest of the *Memoirs*, independent of the large addition of positive knowledge which they make, is one of constant surprise at the novel and adroit use of word and phrase. It is not superfluous to inform the English reader that some of Macaulay's most brilliant portraits and sketches of incident are adapted and sometimes almost literally translated from Saint-Simon.

The 1st edition of Saint-Simon (some scattered pieces may have been printed before) appeared in 1788. It was a mere selection in three volumes and was much out down before it was allowed to appear. Next year four more volumes made their appearance, and in 1791 a new edition, still further increased. The whole, or rather not the whole, was printed in 1829-30 and reprinted some ten years later. The real creator of Saint-Simon, as far as a full and exact text is concerned, was M. Chéruef, whose edition in 20 volumes dates from 1856 and was reissued again revised in 1872. So immense, however, is the mass of Saint-Simon's MSS. that still another recension has been found necessary, and is now being published by M. de Boislisle in the series of *Grands Écrivains*, but with M. Chéruef's sanction and assistance. Even this, as above noted, will not exhaust available Saint-Simoniana, and it may be doubted whether it will be possible for many years to place a complete edition on the shelves. It must, however, be admitted that the matter other than the *Memoirs* is of altogether inferior interest and may be pretty safely neglected by any one but professed antiquarian and historical students. For criticism on Saint-Simon there is nothing better than Sainte-Beuve's two sketches in the 3d and 15th volumes of the *Causeries du Lundi*. The latter was written to accompany M. Chéruef's 1st edition. In English by far the most accurate treatment is in a recent Lothian prize essay by E. Cannan (Oxford and London, 1885). (G. S. A.)

ST THOMAS, one of the Danish West India Islands, lies 36 miles east of Porto Rico (Spanish) and 40 north-west of St Croix (Danish), with its principal town (Charlotte Amalie) in 18° 20' 27" N. lat. and 64° 55' 40" W. long. It is 13 miles long from east to west, with an average breadth of 3, and is estimated to have an area of 33 square miles. The highest point, West Mountain, is 1586 feet above the sea. Previous to the abolition of slavery in 1848 the island was covered with sugar plantations and dotted with substantial mansions; but now a few vegetables, a little fruit, and some guinea grass are all that it produces. Greengroceries are imported from the United States, poultry and eggs from the neighbouring islands. Nor is the exceptional position which St Thomas has hitherto enjoyed as a commercial dépôt any longer secure; the value of the imports in 1880 was less than one-half of what it was in 1870, and the merchants of Venezuela, Porto Rico, San Domingo, Hayti, &c., who used to purchase in St Thomas, now go direct to the markets of the United States and Europe. The Royal Mail Company, which at an early date chose the island as the principal rendezvous for its steam-packets in that part of the world, and whose example was followed by other important lines, removed its headquarters to Barbados in 1885. The harbour lies about the middle of the south coast and is nearly landlocked; its depth varies from 36 to 18 feet. A floating dock, 250 feet in length, was completed in 1875; there is in addition a steam-slip capable of taking up a vessel of 1200 tons. Along the north side of the harbour lies Charlotte Amalie, popularly known as St Thomas, the only town on the island. In 1880 the inhabitants of the island numbered 14,389 (males 5757, females 8632), of whom about a sixth are white, of various nationalities; the rest have nearly all more or less of Negro blood. English has gradually become almost the exclusive language of the educated classes, and is used in the schools and churches of all the various communities. The curious Creole speech of the Negroes, which contained a mixture of broken Dutch, Danish, English, &c., though it was reduced to writing by the Moravian missionaries subsequent to 1770, is rapidly dying out.¹ About a third of the population are Roman Catholics, and the rest mainly Protestants of the Lutheran, Dutch Reformed, Moravian, and English Episcopal Churches. The Jewish community, 500 or 600 strong, has a synagogue. There are in the town two

hospitals, a public reading-room and library, a Government college (1877), a Roman Catholic college (St Thomas), a Moravian school, and a small theatre. A quarantine lazaretto is maintained on Lighthouse or Mühlenfeldt Point. The general health of the town is good. The climate varies little all the year round, the thermometer seldom falling below 70° or rising above 90°. In the "hurricane" months—August, September, and October—south winds, accompanied by sultry heat, rain, and thunder, are not uncommon; throughout the rest of the year the wind blows between east and north. Earthquakes are not unfrequent, but they do little damage in comparison with cyclones, which sometimes sweep over the island.

St Thomas was discovered by Columbus in 1493, and at that time was inhabited by two tribes, the Caribs and the Arrowauks. In 1657 it was colonized by the Dutch, and after their departure for New York it was held by the English in 1687. The Danish West India and Guinea Company took possession in 1671, and some eight years later began the introduction of slave labour. It was succeeded in 1685 by the so-called Brandenburg Company, the principal shareholders of which were Dutch. The colony was strengthened by French refugees from St Christopher's after the revocation of the edict of Nantes. The neutrality of Denmark led to the prizes of the various belligerents being brought to its port for sale. In 1754 the king of Denmark took the management of the colony into his own hands, and in 1764 he threw open the port to vessels of all nations. The neutrality of Denmark again favoured it in the war of 1792; and it became the only market in the West Indies from which the products of the colonies could be conveyed to the north of Europe. In 1801 the island was held by the British for ten months, and it was again in their possession from the latter part of 1807 to 1815. At that time the harbour was three or four times a year the rendezvous for homeward-bound English ships, from 200 to 400, as the case might be, which waited there for their convoys. The South American War of Independence led a number of Spaniards to settle at St Thomas. A great but temporary stimulus was given to its commerce during the American Civil War. In 1871 the Danish Government removed the headquarters of their West India possessions from St Croix to St Thomas.

ST THOMAS (Portuguese, *São Thomé*), a volcanic island in the Gulf of Guinea (West Africa), lies immediately north of the equator and in 6° 40' E. long. From the Gaboon, the nearest point of the mainland, the distance is 166 miles, and from the Cameroons 297. The extreme length of the island is 32 miles and the breadth from west to east 21; the area is estimated at 355 square miles. From the coast it rises pretty uniformly towards the lofty and verdant mountains, in the midst of which the peak of St Thomas towers to a height of 6000 feet. At least a hundred streams great and small rush down the mountain-sides through deep-cut ravines, many of them forming beautiful waterfalls, such as those of Blu-blu, &c., on the Agua Grande. The bi-seasonal climate of the tropics obtains a comparatively normal development on the island, which, however, has a very evil repute of unhealthiness, probably owing to the fact that the chief town occupies a peculiarly malarial site on the coast. The first object of European cultivation in St Thomas was sugar, and to this the colony owed its prosperity in the 16th century; but now it is quite displaced by coffee and cocoa, introduced in the beginning of the 19th century. In 1879-80 the export of coffee was 3,778,580 lb and of cocoa 1,026,746 lb. Vanilla and cinchona bark both succeed well, the latter between 1800 and 3300 feet of altitude. Though nearly the whole surface of the island is fitted for cultivation, only about a fifth part is really turned to account. Along with Principe, St Thomas forms a Portuguese province, to which are attached the little island of Rolas and the petty fort of Ajuda on the Guinea coast.

The town of St Thomas, the capital of the province, is situated on the north-east coast of the island, and the neighbouring districts form the only well-peopled region. In 1878 the population in the island was 18,266, of whom 1200 were white. The great bulk consisted of a mixture of Negroes from various parts of the West Coast, mainly introduced as slaves, and now all using a Negro Portuguese—"lingua de S. Thomé." On the south-west coast are

¹ See specimens and analysis by Dr E. Pontoppidan, in *Ztschr. f. Ethnol.*, Berlin, 1881.

about 1200 Angolares, descendants of a shipload of Angola slaves wrecked at Sete Pedras in 1544, who still retain their Bunda speech and peculiar customs.

St Thomas was discovered about the close of 1470 by the Portuguese navigators João de Santarem and Pero de Escobar, who in the beginning of the following year discovered Annobom ("Good Year"). They found St Thomas uninhabited. The first attempts at colonization were João de Paiva's in 1485; but nothing permanent was accomplished till 1493, when a body of criminals and of young Jews torn from their parents to be baptized were sent to the island, and the present capital was founded by Alvaro de Carminha. Considerable progress had been made by the 16th century; but in 1567 the settlement was attacked by the French, and in 1574 the Angolares began those raids which only ended with their subjugation in 1693. In 1595 there was a slave revolt; and from 1641 to 1644 the Dutch, who had plundered the capital in 1600, held possession of the island. The French did great damage in 1709; and in the course of the century internal anarchy reduced St Thomas to a deplorable state.

See Dr Greeff's papers in *Petermann's Mittheilungen*, 1884, and *Globus*, 1882, vol. xlii.

SAINT-VICTOR, PAUL DE (1827-1883), one of the chief masters of a very ornate style in recent French literature, was born at Paris in 1827 and died there in 1883. He was of noble birth and inherited the title of count, but rarely used it, his political principles being democratic. Saint-Victor began as a dramatic critic on the *Pays* in 1851 and subsequently wrote in many journals. In 1870, during the last days of the second empire, he was made inspector-general of fine arts. Almost all Saint-Victor's work consists of reprinted articles, the best known, and on the whole the best, being the collection entitled *Hommes et Dieux* (1867). His death interrupted the publication of an elaborate work, partly reprinted, partly developed from formerly printed papers, entitled *Les Deux Masques*, in which the author intended to survey the whole dramatic literature of ancient and modern times. Saint-Victor's actual critical faculty was considerable, though rather one-sided; but his position in French literature is likely to be, in an inferior degree, something like that of Mr Ruskin in English. He owed a good deal to Théophile Gautier, but he carried ornateness to a pitch far beyond Gautier's, —a pitch which may sometimes deserve the epithet "barbaric."

ST VINCENT, an island in the West Indies, discovered by Columbus in 1498, is situated in 13° 10' N. lat. and 60° 57' W. long., 100 miles to the west of Barbados; it is 18 miles in length, 11 in breadth, and has an area of 132 square miles. Volcanic hills cross the island from north to south, intersected by beautiful and fertile valleys. In the north-west is the Souffriere, a volcanic mountain (3000 feet), of which the last violent eruption was in 1812; the crater is 3 miles in circumference and 500 feet in depth. The climate is humid and tolerably healthy (average rainfall nearly 80 inches). In 1627, when Charles I. granted St Vincent to the earl of Carlisle, it was peopled by Caribs; in 1672 it was given to Lord Willoughby, and in 1722 was granted, along with other islands, to the duke of Montagu by George I. After hostilities with the French and Caribs, it passed definitively to Great Britain in 1783. Immigrants were afterwards introduced and plantations cultivated; the chief products are sugar, rum, molasses, and arrowroot. The capital is Kingstown (population, 5593), the total population of the island being 42,200, including 2700 Europeans and 30,000 Africans. The island was formerly under the general government of the Windward Islands, Barbados being headquarters; but in 1885 Barbados was made a separate government, and Grenada, St Vincent, Tobago, and St Lucia were placed under a governor. The legislative council of St Vincent is composed of official members and others nominated by the crown. In 1883 the revenue and expenditure were respectively £34,509 and £32,962, the debt being £2840. The tonnage entered and cleared was 172,989, the imports

and exports being valued at £148,286 and £166,752 respectively (sugar exports, 9250 tons).

ST VINCENT, SIR JOHN JERVIS, EARL (1734-1823), a distinguished naval officer, was born at Meaford, Staffordshire, on 9th January 1734. His father was counsel and solicitor to the admiralty and treasurer of Greenwich hospital. Young Jervis was destined for the law, but early showed such a strong predilection for the sea that he ran away from school in order to become a sailor. Accordingly in 1748 he was placed on board the "Gloucester" under Commodore Townsend. Six years later he rose to be lieutenant, and in 1759 he distinguished himself so much at the siege and capture of Quebec that he was promoted to the rank of commander. In the following year he was made a post-captain. He commanded the "Foudroyant" in July 1778, when the memorable *rencontre* took place between Admiral Keppel and Count d'Orville, and bore a very distinguished part in that action. In 1782, while in command of the same vessel, he captured the French ship "Pégase," of 74 guns and 700 men, off Brest Harbour, and was rewarded for his exploit by being made Knight Companion of the Bath. In 1784 he entered parliament as member for Launceston, and he afterwards sat for Yarmouth. Conjointly with Sir Charles Grey, Jervis was appointed to command an expedition sent out in 1793 against the French Caribbee islands, and, though the rainy season and the yellow fever prevented the full success of the British, they were able to obtain possession of Martinique and St Lucia, and to hold Guadaloupe for a short time. In 1795 Jervis became full admiral and succeeded Lord Hood in command of the British fleet in the Mediterranean, where he rendered important service in blockading the French fleet in Toulon, and protecting English trade in the Levant. On 14th February 1797 he won his most celebrated victory. With only fifteen ships of the line, seven frigates, and two sloops he encountered off Cape St Vincent a Spanish fleet of twenty-six sail of the line, twelve frigates, and a brig, and completely defeated it, capturing four of the enemy's largest ships. For this great triumph, which had a most important effect on the prosecution of the war, Jervis was created a peer by the title of Earl St Vincent. He still further distinguished himself some months later by his resolute and sagacious conduct in repressing a mutiny in his fleet when off Cadiz. In June 1799 he resigned his command in consequence of ill-health, but was shortly afterwards placed at the head of the Channel fleet. On the formation of the Addington ministry in 1801 he was made first lord of the admiralty, and in that important office, which he held for three years, the great capacity for business with which he was endowed by nature shone forth in all its lustre. By means of the celebrated commission of naval inquiry he was enabled to expose a vast extent of corruption in the public service and to lay the foundation of a system of economical administration. He grappled boldly with the monstrous and deep-rooted abuses brought to light, and by his vigour, honesty, and energy succeeded in rectifying them. In 1806, at the age of seventy-two, Lord St Vincent was again called upon to take the command of the Channel fleet and to head an expedition to the court of Portugal, in which he displayed great talents and address. Advanced age and impaired health led to his final retirement from public life in 1807, but he survived till 13th March 1823, when he died in his ninetieth year.

See Brenton, *Life of Earl St Vincent*; Lord Brougham, *Statesmen of the Times of George III.*

ST VITUS'S DANCE,¹ or CHOREA, a disorder of the

¹ This name was originally employed in connexion with those remarkable epidemic outbursts of combined mental and physical excitement which for a time prevailed among the inhabitants of some parts of Germany in the Middle Ages. It is stated that sufferers from

nervous system occurring for the most part in children, and characterized mainly by involuntary jerking movements of the muscles throughout almost the entire body. It is to be regarded as a functional nervous disorder of wide extent, the manifestations of which appear not merely in disturbance affecting the motor apparatus but in various associated morbid phenomena of cerebral origin. Among the predisposing causes age is important, chorea being essentially an ailment of childhood and more particularly of the period in which the second dentition is taking place. The greater number of the cases occur between the ages of nine and twelve. It is not often seen in very young children nor after puberty; but there are many exceptions to this rule. It is twice as frequent with girls as with boys. Hereditary predisposition to nervous troubles is apt to find expression in this malady in youth, more especially if the general health becomes lowered. Of exciting causes strong emotions, such as fright, ill-usage or hardship of any kind, insufficient feeding, overwork or anxiety, are among the most common; while, again, some distant source of irritation, such as teething or intestinal worms, appears capable of giving rise to an attack. It is an occasional but rare complication of pregnancy. The connexion of chorea with rheumatism is now universally recognized, and is shown not merely by its frequent occurrence before, after, or during the course of attacks of rheumatic fever in young persons, but even independently of this by the liability of the heart to suffer in a similar way in the two diseases.

The symptoms of St Vitus's dance are in some instances developed suddenly as the result of fright, but much more frequently they come on insidiously. They are usually preceded by changes in the temper and disposition, the child becoming sad, irritable, and emotional, while at the same time the general health is somewhat impaired. The first thing indicative of the disease is a certain awkwardness or fidgetiness of manner together with restlessness, the child being evidently unable to continue quiet, but frequently moving the limbs into different positions. In walking, too, slight dragging of one limb may be noticed. The convulsive muscular movements usually first show themselves in one part, such as an arm or a leg, and in some instances they may remain localized to that limited extent, while in all cases there is a tendency for the disorderly symptoms to be more marked on one side than on the other. When fully developed the phenomena of the disease are very characteristic. The child when standing or sitting is never still, but is constantly changing the position of the body or limbs in consequence of the sudden and incoördinate action of muscles or groups of them. The shoulder is jerked up, the head and trunk twisted about, the limbs crossed suddenly and changed again, the fingers keep moving restlessly, while the face is distorted with grimaces, frowning and smiling irregularly. These symptoms are aggravated when purposive movements are attempted or when the child is watched. Speech is affected both from the incoördinate movements of the tongue and from phonation sometimes taking place during an act of inspiration. The taking of food becomes a matter of difficulty, since much of it is lost in the attempts to convey it to the mouth, while swallowing is also interfered with owing to the irregular action of the pharyngeal muscles. When the tongue is protruded it comes out in a jerky manner and is immediately withdrawn, the jaws at the same time closing suddenly and sometimes with convulsive dancing mania were wont to resort to the chapels of St Vitus (more than one in Swabia), the saint being believed to possess the power of curing them. The transference of the name to the disease now under consideration was a manifest error, but so closely has the association now become that the original application of the term has been comparatively obscured.

siderable force. In locomotion the muscles of the limbs act incoördinately and there is a marked alteration of the gait, which is now halting and now leaping, and the child may be tripped by one limb being suddenly jerked in front of the other. In short, whether at rest or in motion the whole muscular system is seen to be deranged in its operations, and the term "insanity of the muscles" not inaptly expresses the condition, for they no longer act in harmony or with purpose, but seem, as Trousseau expresses it, each to have a will of its own and to be exercising this for different objects at one time. The muscles of organic life (involuntary muscles) appear scarcely, if at all, affected in this disease, as, for example, the heart, the rhythmic movements of which are not as a rule impaired. But the heart may suffer in other ways, especially from inflammatory conditions similar to those which attend upon rheumatism and which frequently lay the foundation of permanent heart-disease. In severe cases of St Vitus's dance the child comes to present a distressing appearance from the constant restlessness and disorderly movement, and the physical health declines. Usually, however, there is a remission of the symptoms during sleep. The mental condition of the patient is more or less affected, as shown in emotional tendencies, irritability, and a somewhat fatuous expression and bearing, but this change is in general of transient character and ceases with convalescence.

This disease occasionally assumes a very acute and aggravated form, in which the disorderly movements are so violent as to render the patient liable to be injured and to necessitate forcible control of the limbs or the employment of anæsthetics to produce unconsciousness. Such cases are of very grave character, if, as is common, they are accompanied with sleeplessness, and they may prove rapidly fatal by exhaustion. In the great majority of cases of St Vitus's dance, however, complete recovery is to be anticipated sooner or later, the symptoms usually continuing for from one to two months, or even sometimes much longer.

The nature of this disease has given rise to much discussion and there still remains considerable difference of opinion as to its true pathology. The fact that the vast majority of cases recover would seem to show that there could have been no profound change in the structural integrity of the nerve-centres, while in those instances where a fatal result takes place *post-mortem* examination reveals no constant morbid condition. A theory supported by high authority has referred the cause of the malady to the plugging up of minute blood-vessels in the motor-centres of the brain (a condition not unlikely to occur in rheumatic inflammation affecting the lining membrane of the heart), and such a change has been seen in a few instances. In a still larger number, however, no appearances of this kind have been observed, but simply vascular changes of a congestive character widely diffused throughout the central nervous system, accompanied with evidences of slight inflammatory action. Dr Dickinson, whose views, founded upon carefully conducted investigations, are those most widely accepted, concludes as follows: "We see in chorea a widely distributed hyperæmia [*i.e.*, congestion] of the nervous centres, not due to any mechanical mischance, but produced mainly by causes of two kinds,—one a morbid, probably a humoral influence, which may affect the nervous centres as it affects other organs and tissues; the other, irritation in some mode usually mental but sometimes what is called reflex, which especially belongs to and disturbs the nervous system, and affects persons differently, according to the inherent mobility of their nature."

For the treatment of St Vitus's dance the remedies proposed have been innumerable, but it is doubtful whether any of them have much control over the disease, which

under suitable hygienic conditions tends to recover of itself. These conditions, however, are all-important, and embrace the proper feeding of the child with nutritious light diet, the absence of all sources of excitement and annoyance, such as being laughed at or mocked by other children, and the rectification of any causes of irritation and of irregularities in the general health. For a time, and especially if the symptoms are severe, confinement to the house or even to bed may be necessary, but as soon as possible the child should be taken out into the open air and gently exercised by walking. Of medicinal remedies the most serviceable appear to be zinc, arsenic, and iron, especially the last two, which act as tonics to the system and improve the condition of the blood. They should be continued during the whole course of the disease and convalescence, if they do not disagree. As sedatives in cases of sleeplessness, bromide of potassium and chloral are of use. Many other agents, such as conium, belladonna, strychnia, the salts of silver, &c., have been recommended, but they do not seem to possess any special advantages. In long-continued cases of the disease much benefit will be obtained by a change of air as well as by the employment of moderate gymnastic exercises. Bearing in mind the weakened condition of the muscles as the result of the choreic movements, the employment of friction and of electricity is also likely to be beneficial. After recovery the general health of the child should for a long time receive attention, and care should be taken to guard against excitement, excessive study, or any exhausting condition, physical or mental, from the fact that the disease is apt to recur and that other nervous disorders still more serious may be developed from it.

In the rare instances of the acute form of this malady, where the convulsive movements are unceasing and violent, the only measures available are the use of chloral or chloroform inhalation to produce insensibility and muscular relaxation, but the effect is only palliative and does not prevent the fatal result which in most such cases quickly supervenes.

ST UBES. See SETUBAL.

SAIS. See EGYPT, vol. vii. p. 768.

SALADIN. See EGYPT, vol. vii. pp. 753-754.

SALAMANCA, a province of Spain, which until 1833 formed part of that of Leon, is bounded on the N. by Zamora and Valladolid, on the E. by Avila, on the S. by Caceres, and on the W. by Portugal. It has an area of 4940 square miles. The population in 1877 was 285,500; but by the year 1886 it was estimated that it had decreased to about 270,000. Salamanca belongs almost entirely to the basin of the Douro, its principal rivers being the Tormes, which follows the general slope of the province towards the north-west, and after a course of 135 miles flows into the Douro, which forms part of the north-west boundary; the Yeltes and the Agueda, also tributaries of the Douro; and the Alagon, an affluent of the Tagus. The northern part of the province is flat, and at its lowest point (on the Douro) is 488 feet above sea-level. The highest point (in the Sierra de Peña de Francia) is 5692 feet above the sea. The rainfall is irregular; but where it is plentiful the soil is productive and there are good harvests of wine, oil, hemp, and cereals of all kinds. The corn harvest is always good, rain or no rain. The principal wealth of the province consists in the forests of oak and chestnut, which cover the hills in its southern part. Sheep and cattle also find good pasturage there; and wool and merino of medium quality are grown. Gold is found in the streams, and iron, lead, copper, zinc, coal, and rock crystal in the hills, but owing to the difficulties of transport and other causes the mines are only partially developed. The manufactures of the province are few and

mostly of a low class, intended for home consumption, such as frieze, coarse cloth, hats, and pottery. The cloth manufactories of Bejar turn out a material of superior quality. The tanning of hides is carried on pretty extensively, and cork and flour are exported *via* Santander and Barcelona. The province is traversed by a railway line to Portugal, passing Medina del Campo and Ciudad Rodrigo to Figueira da Foz. Administratively the province is divided into eight *partidos judiciales*, and it has 388 *ayuntamientos*; of these last only two besides Salamanca, the capital, have a population exceeding 5000,—Bejar (11,099) and Ciudad Rodrigo (6856). It is represented in the cortes by three senators and seven deputies. Apart from that of Leon the province has little history till the Peninsular War, when the battles of Ciudad Rodrigo, Fuentes de Oñoro, and Salamanca were fought on its soil.

SALAMANCA (*Salmantica*, *Elmantica*), the capital of the above province, lies on the banks of the Tormes, 172 miles north-west of Madrid by rail. The river is here crossed by a bridge 500 feet in length built on twenty-six arches, fifteen of which are of Roman origin, while the remainder date from the 16th century. The town was of importance in times as remote as 222 B.C., when it was captured by Hannibal from the Vettones; and it afterwards became under the Romans the ninth station on the *Via Lata* from Merida to Zaragoza. It passed successively under the rule of the Goths and the Moors, till the latter were finally driven out about 1055. The city is still much the same in outward appearance as when its tortuous streets were thronged with students. The university was naturally the chief source of wealth to the town, the population of which in the 16th century numbered 50,000. Its decay of course reacted on the townsfolk, but it fortunately also arrested the process of modernization, so that the city retains most of its old features and is now one of the most picturesque in Spain. The ravages of war alone have wrought serious damage, for the French in their defensive operations at the siege almost destroyed the western quarter. The ruins still remain, and give an air of desolation which is not borne out by the real condition of the inhabitants, however poverty-stricken they may appear. The magnificent Plaza Mayor, built by Andres Garcia de Quiñones at the beginning of the 18th century, and capable of holding 20,000 people to witness a bullfight, is one of the finest squares in Europe. It is surrounded by an arcade of ninety arches on Corinthian columns, one side of the square being occupied by the municipal buildings. The decorations of the façades are in the Renaissance style, and the plaza as a whole is a fine sample of plateresque architecture. But the old and new cathedrals (see below) are the chief objects of interest in the city.

In the Middle Ages the trade of Salamanca was not insignificant, and the stamped leather-work produced there is still sought after. Its manufactures are now of little consequence, and consist of china, cloth, and leather. The transport trade of the town is, however, of more importance, and shows signs of increasing. But any great revival can only take place when communication with the coast is considerably improved, a result which will no doubt be promoted by the recent opening of the line to the coast of Portugal. The population within the municipal boundaries in 1877 was 18,007, and in 1886 was estimated at about 20,000.

The old cathedral is a cruciform building of the 12th century, begun by Bishop Gerónimo, the confessor of the Cid. Its style of architecture is that Late Romanesque which prevailed in the south of France, but the builder showed much originality in the construction of the dome, which covers the crossing of the nave and transepts. The inner dome is made to spring, not from immediately above the arches, but from a higher stage of a double arcade pierced

with windows. The thrust of the vaulting is borne by four massive pinnacles, and over the inner dome is an outer pointed one covered with tiles. The whole forms a most effective and graceful group. On the vault of the apse is a fresco of Our Lord in Judgment by Nicolas Florentino. The reredos, which has the peculiarity of fitting the curve of the apse, contains fifty-five panels with paintings mostly by the same artist. There are many fine monuments in the south transept and cloister chapels. An adjoining building, the Capilla de Talavera, is used as a chapel for service according to the Mozarabic rite, which is celebrated there six times a year. On the north of and adjoining the old church stands the new cathedral, built from designs by Juan Gil de Ontañon. Begun in 1513 under Bishop Francisco de Bobadilla, but not finished until 1734, it is a notable example of the late Gothic and Plateresque styles. Its length is 340 feet and its breadth 160 feet. The interior is fairly Gothic in character, but on the outside the Renaissance spirit shows itself more clearly, and is fully developed in the dome. Everywhere the attempt at mere novelty or richness results in feebleness. The main arch of the great portal consists of a simple trefoil, but the label above takes an ogee line, and the inner arches are elliptical. Above the doors are bas-reliefs, foliage, &c., which in exuberance of design and quality of workmanship are good examples of the latest efforts of Spanish Gothic. The church contains paintings by Navarrete, Becerra, and Morales, and some overrated statues by Juan de Juni. The treasury is very rich, and amongst other articles possesses a custodia which is a masterpiece of goldsmith's work, and a bronze crucifix, of undoubted authenticity, which was borne before the Cid in battle. The tower is too unsafe to allow of the ringing of its great bell, which weighs over 23 tons. The interest of Salamanca centred in its university, founded by Alfonso IX. about 1200 and for four centuries one of the chief seats of European learning. Of the university buildings the façade of the library (80,000 volumes, exclusive of MSS.) is a peculiarly rich example of late 15th-century Gothic. The cloisters are light and elegant; the grand staircase ascending from them has a fine balustrade of foliage and figures. The Colegio de Nobles Irlandeses, formerly Colegio de Santiago Apostol, was built in 1521 from designs by Ibarra. The double arcaded cloister is a fine piece of work of the best period of the Renaissance. The Jesuit College is an immense and ugly Renaissance building begun in 1614 by Juan Gomez de Mora. The Colegio Viejo, also called San Bartolomé, was rebuilt in the 18th century, and now serves as the governor's palace. The convent of Santo Domingo, sometimes called San Esteban, shows a mixture of styles from the 13th century onwards. The church is Gothic with a plateresque façade of great lightness and delicacy. It is of purer design than that of the cathedral; nevertheless it shows the tendency of the period. The reredos, one of the finest Renaissance works in Spain, contains statues by Salvador Carmona, and a curious bronze statuette of the Virgin and Child on a throne of champlévé enamel of the 12th century. The chapter-house, built by Juan Moreno in 1637, and the staircase and sacristy are good examples of later work. The convent of the Augustinas Recoletas, begun by Fontana in 1616, is in better taste than any other Renaissance building in the city. The church is rich in marble fittings and contains several fine pictures of the Neapolitan school, especially the Conception by Ribera over the altar. The convent of the Sancti Spiritu has a good door by Berruguete. There is also a rather effective portal to the convent of Las Dueñas. The church of S. Marcos is a curious circular building with three eastern apses; and the churches of S. Martin and S. Matteo have good early doorways. Many of the private houses are untouched examples of the domestic architecture of the prosperous times in which they were built. Such are the Casa de las Conchas, the finest example of its period in Spain; the Casa de la Sal, with a magnificent courtyard and sculptured gallery; and the palaces of Maldonado, Monterey, and Espinosa. (H. B. B.)

SALAMANDRA. In the nomenclature of zoology this name designates a genus of animals belonging to the vertebrate class *Amphibia*. The genus was first defined under this name by Laurenti.¹ It will be seen on referring to the taxonomic synopsis of the class given at the end of the article AMPHIBIA that the genus *Salamandra* belongs to the first tribe *Mecodontia* of the fifth division *Salamandrida*. The diagnosis of the genus is as follows:—no fronto-squamosal arch in the skull; tongue large, adherent below, free at the sides and slightly so behind; toes five; tail cylindrical. There are three species, distinguished as follows:—(1) *S. maculosa*, Laurenti, tail not so long as rest of body, colour black with yellow spots; (2) *S. atra*, Laurenti, tail not so long as rest of body, colour uniform black; (3) *S. caucasica*, Waga, tail longer than rest of

body. In all the species the body is plump and rounded, and there is no dorsal crest or fin; the head is depressed, its greatest width being at the angle of the jaws; the snout is rounded. The vent is a longitudinal slit, the borders of which in the male are slightly swollen. The skin is smooth and shining; at the junction of the head and neck is a pronounced fold of skin called the gular fold. The swollen patches of skin behind the tympana, caused by the presence of large cutaneous glands, and known as parotids, are well developed and exhibit the openings of the glands as distinct pores. Similar gland-openings form a series along either side of the body. In the first two species there is also a longitudinal series of warts on each side; these are wanting in *S. caucasica*. Depressions of the skin between the vertebræ are present, and are known as costal grooves. The palatine teeth-series are S-shaped, and the anterior ends of the two series do not meet.² *S. maculosa* is the largest of the three species, attaining a length of 7 to 8½ inches. *S. atra* is about 4½ and *S. caucasica* about 6 inches in length.

The genus is confined to the western sub-region of the palæarctic region, extending over almost the whole of Europe, especially the central and southern parts, and occurring also in Algiers and Syria. The spotted species is the commonest and most widely distributed, being found in nearly all parts of Germany, France, Italy, and Spain. The genus is entirely absent from the British Islands. The black salamander, *S. atra*, is confined to the Alps of Central Europe, and there only occurs between the limits of 2500 to 10,000 feet of altitude; it is found in the mountains of South Germany, France, Switzerland, and Austria. *S. caucasica* is only known from one specimen, which was obtained from the Caucasus and was sent to the Paris Museum by Dr Waga.³

The food of *Salamandra* consists of worms and insects, and, like British frogs and toads, the animals can only exist in damp shady localities. As in all *Salamandrida*, the process of reproduction is commenced by a true copulation, which takes place in spring and summer. The seminal fluid is passed into the female cloaca, where it is received into a tube-shaped receptaculum seminis. The eggs are thus fertilized in the oviduct, but the development takes place under somewhat different conditions in the two species *S. maculosa* and *S. atra*. Both species are viviparous; in the former thirty to forty eggs undergo development in the oviducts at one time, and they are brought forth and deposited in stagnant or sluggishly-flowing water when they have reached a stage similar to that of adult *Perennibranchiata*, the newly-born larvæ having long feather-like external gills and a length of 12 to 15 mm. (one-third to one-half an inch). After a period of aquatic life, the larvæ pass through a metamorphosis: the limbs appear; the gill slits close up; and the young animals, having reached the adult condition, leave the water for a terrestrial life. In *S. atra* only the two lowest eggs which pass into the oviducts, one in the duct of each side, undergo development. The rest of the eggs fuse into a mass of yolk material and are devoured by the two developing larvæ. In this way the larvæ are provided with nutriment during the later stages of development, for in this species they are retained within the body of the mother until they have reached the air-breathing condition and are in all respects similar to the parents. This peculiarity in the process of reproduction bears an obvious relation to the physical conditions of the habitat of *S. atra*. In the elevated regions that the species inhabits stagnant and

² For a figure of *S. maculosa*, see Latreille, *Hist. Nat. des Sal. de France*, Paris, 1800, pl. i.; Daudin, *Hist. Nat. d. Reptiles*, pl. xcvi. f. 1. For *S. atra*, see Laur., *op. cit.*, pl. i. f. 2.

³ See Waga, *Rev. Mag. Zool.*, 1876, p. 326.

¹ *Synopsis reptilium emendata*, &c., Vienna, 1768.

sluggish waters are wanting, and therefore the process of reproduction that occurs in *S. maculosa* is rendered impossible. The black *Salamandra* has become adapted to its environment (1) by the slight changes in colour and structure which distinguish it from the spotted, and (2) by a modification in its reproductive processes, which eliminates the aquatic stage of existence from the life-history of the individual. It is to be noted that the stage characterized by the presence of pinnate external gills is exhibited by the larva during its development in the oviduct, and the gills doubtless there perform their function. Fräulein von Chauvin¹ made the experiment of taking the larvæ of *S. atra* from the pregnant female when they were in the branchiate condition, and placing them in water to see if they would survive and pass through their metamorphosis under these circumstances. On one occasion the experiment was perfectly successful in the case of one specimen; the rest of the larvæ died.

The tailed *Amphibia* of Europe have from the very earliest times down to the present day been almost universally known in popular language as salamanders, and identified in the popular mind with the salamander of myth and fable.² Besides the species of *Salamandra* there are, according to Boulanger (*Brit. Mus. Cat.*, 1881), eighteen other species of *Urodela* in Europe, of which fourteen belong to the genus *Triton* (*q.v.*). *Chioglossa lusitanica*, Bocage, is distinguished by having a tongue supported anteriorly by a protractile median pedicle and free everywhere else, and by having its tail cylindrical at the base but compressed at the end. It occurs in Spain and Portugal. *Salamandrina perspicillata*, Tschudi, occurs in Italy; like *Chioglossa*, it belongs to the *Mecodonta* and is distinguished by the following characters:—tongue large, subtriangular, free everywhere except on anterior median line; toes four; tail slightly compressed; a strong bony fronto-squamosal arch. *Spelerpes fuscus*, Strauch, occurs in Italy and in France in the Alpes Maritimes.

SALAMIS, in modern times called by the people Κολούρι (a ring-shaped cake), and by purists Σαλαμίς, is an island in the Saronic Gulf, off the coast of Attica, Greece. It is said to have been called in ancient times by other names,—Sciras, which associates it with the worship of Athena Sciras; Cychreia, which connects it with the Eleusinian cultus and the sacred serpent (Κυχρείδης ὄφις) of Demeter; and Pityussa. There was a small stream, Bocarus or Bocalia, in the island. The city, which bore the same name as the island, was originally situated on the south coast opposite Ægina, but was afterwards transferred to a promontory on the east side nearer Athens. The transference corresponds to a total change in the

political relations of Salamis. It was originally connected, not with Attica, but with Ægina and with Megara, the competitors of Athens in the struggle for supremacy in the Saronic Gulf. The most prominent heroes of the island, Telamon, Ajax, and Teucer, were Æacidæ from Ægina. But about the end of the 7th century B.C. the war between Athens and Megara for the possession of Salamis was, under the guidance of Solon, determined in favour of Athens. A line of the *Iliad* (ii. 558) is said to have been interpolated by the Athenians in support of their claim to the island, while the Megarian version of the passage was quite different. The priestess of Athena Polias might not eat Attic cheese, but it was lawful for her to eat foreign or Salaminian cheese. Salamis, having come so late into the hands of the Athenians, retained, like Eleusis, more local independence than the other demes. The island remained subject to Athens in later history, except during the period 318 to 232 B.C., when it was abandoned to the Macedonian rule. The name of Salamis is famous chiefly on account of the great sea-fight, 480 B.C., in which the allied Greeks defeated the Persians under Xerxes. The battle took place beside the town of Salamis and the island of Psytaleia, at the south-eastern end of the straits.

A city on the east coast of Cyprus, near the river Pedæus, said to have been founded by the Salaminian Teucer, son of Telamon, was also called Salamis.

SALDANHA, João Carlos Saldanha de Oliveira e Daun (1791-1876). See PORTUGAL, vol. xix. pp. 553-554.

SALE, an urban sanitary district of Cheshire, England, on the Bridgewater Canal and the Mersey, about 5 miles south of Manchester. At the beginning of the 19th century the greater part of the township was still waste and unenclosed. It owes its increase in population to the neighbourhood of Manchester and contains a number of handsome villas belonging to the wealthier classes. The Moorsland pleasure-grounds in the neighbourhood cover 10½ acres. There are national and British schools and a literary institute. Market gardening is extensively carried on. The population of the urban sanitary district (area, 2006 acres) in 1871 was 5573, and in 1881 it was 7915.

SALE is one of the forms of CONTRACT (*q.v.*). The law of contract is accordingly applicable as a whole to the law of sale. But the importance of the contract of sale demands a fuller treatment. The law of the United Kingdom and of the United States is based upon the Roman law in its later stage, as modified by the prætors and by legislation. But there are some considerable differences. In Roman law sale originally meant nothing more than barter; but the introduction of coined money converted the contribution of one of the contracting parties into price (*pretium*), as distinguished from article of sale (*merx*) contributed by the other (see ROMAN LAW, vol. xx. pp. 700-701). Sale fell under the head of consensual contracts, *i.e.*, those in which the *causa* or that which made the contract enforceable was consent. In all contracts of this class (except *mandatum*) consent really denoted valuable consideration. The law in the case of movables and immovables was as far as might be the same. The price must be definite. Reduction of the terms to writing was optional; if a writing was used, either party was at liberty to withdraw before the completion of the writing. If earnest or deposit (*arrha*)—often a ring, sometimes a part of the price—was given, it was by the legislation of Justinian made the measure of forfeit on rescission, the buyer losing what he had given as *arrha*, the seller restoring double its value. The seller did not warrant title; his contract was not *rem dare*, to give the thing, but *præstare emptori rem habere licere*, to

¹ See *Zeitschr. f. wiss. Zoologie*, vol. xxvii. p. 534, and C. von Siebold, *ibid.*, p. 536; M. v. Chauvin, *ibid.*, vol. xxiv.

² Aristotle (*H. A.*, v. 19) cites the salamander, which "when it walks through fire extinguishes it," as a proof that some animal frames are incombustible, and Ælian (*Nat. An.*, ii. 31) will have it that those who work with forges are familiar with this fact and when their bellows fail to quicken the flame know to look for a salamander and put things right by killing it. According to this form of the fable the salamander, as Ælian expressly says, is not born of fire, nor does it live therein. On the contrary, according to Pliny (*H. N.*, x. 67 sq., xxix. 4) it is of a cold complexion and emits a cold venom like aconite, but so virulent that even bread baked with wood of a tree on which a salamander has crept is poisonous. The touch of its saliva even on the foot, says Pliny, causes the hair to fall out. So Dioscorides speaks of salamander prepared in oil as a depilatory; comp. Petronius, c. 107, and Burman's notes, and for late survivals in Europe of the belief in a deadly lizard, identified with the salamander, Bochart, *Hierozoicon*, bk. iv. c. 1. That the salamander extinguishes fire appears also in the *Physiologus* (*q.v.*), and so became a common part of mediæval animal lore; but the Arabic *Physiologus* (Land, *Anec. Syr.*, iv. 166) speaks instead of a stone that quells fire. This stone is asbestos, the salamander of Marco Polo (i. 215, Yule), of whose fibres a sort of incombustible cloth was made, which was represented in the East as made of the hair of the salamander or of its plumage; for the Arabs mixed up the salamander fable with that of the PHœNIX (*q.v.*) and were not sure whether it was beast or bird. In later story the salamander is represented as born and living in fire and so the name is used by cabalistic moderns for the spirits of that element. Salamander's wool or hair as a name for asbestos occurs in Bacon and other English writers. Francis I. chose as his emblem a salamander with the motto, "J'y vis et ie l'éteins."

guarantee the buyer possession; the transfer was of *vacua possessio*, not of property. The buyer was secured by a covenant *duplex stipulatio* against eviction by a superior title, limited to double the price where there was no fraud by the seller. There was a warranty of quality by the seller. He was bound to suffer rescission or to give compensation at the option of the buyer if the thing sold had undisclosed faults which hindered the free possession of it. The damages to which he was liable differed according as he was guilty of bad faith (*dolus*) or not. If guilty he was liable for all consequential damage, if innocent only for the diminution in the value of the thing sold by reason of its unsoundness. Thus, if a seller knowingly sold an infected sheep and the whole flock caught the disease and died, he would be liable for the value of the flock; if he was ignorant of the defect, he would be liable only for the difference in value between a sound and an unsound sheep. Mere overpraise did not amount to *dolus*; nor was inadequacy of price in itself a ground of rescission. When the agreement was complete it was the duty of the seller to deliver the thing sold (*rem tradere*). In case of a sale on credit, the delivery must be made at the time appointed. Prior to delivery the seller must take due care of the thing sold, the care which a reasonably prudent householder (*bonus paterfamilias*) was expected to exercise. Delivery did not pass property in the full sense of the word, but rather *vacua possessio* secured by *duplex stipulatio*. Risk of loss (*periculum rei venditæ*) after agreement but before delivery fell upon the buyer. On the other hand, he was entitled to any advantage accruing to the thing sold between those dates. It was the duty of some one to pay the price; the obligation was discharged if payment were made by the debtor or by any other person, whether authorized or not by the debtor, and even against his will. The duties of buyer and seller might be varied by agreement, the only restriction being that the seller could not by any agreement be relieved from liability for *dolus*.

Sale in English law may be defined to be "a transfer of the absolute or general property in a thing for a price in money" (Benjamin, *On Sales*, p. 1). The words "absolute or general" are inserted because there may be both a general and a special property in certain cases, and a transfer of the special property would not be a sale. The above definition, though applied in the work cited only to sales of personalty, seems to be fully applicable to sales of any kind of property. The rules as to legality, capacity of parties, assent, and fraud depend upon the law of CONTRACT (*q.v.*), of which sale is a particular instance. Incapacity is either absolute or relative, the latter being a bar only in the individual case, *e.g.*, the incapacity of a person in a fiduciary position (see TRUST). The capacity of parties tends to become more extended as law advances; thus in England the Roman Catholic, the alien, and the married woman have all been relieved within a comparatively recent period from certain disabilities in sale and purchase which formerly attached to them.

In England, for historical reasons (see REAL ESTATE), there is a considerable difference in the law as it affects real and personal estate. The main principles of law are perhaps the same, but the sale of real estate is a matter of greater expense and intricacy than the sale of personal estate, and depends to a large extent upon legislation inapplicable to the latter. It appears, therefore, better to treat the two kinds of sale separately.

Real Estate.—At common law it was not necessary that there should be written evidence of a contract of sale. The publicity of the feoffment obviated the necessity of writing, which was not essential to the validity of a feoffment until the Statute of Frauds (see FEOFFMENT). The earliest statute making a written instrument essential to

a sale appears to be the Statute of Enrolments (27 Hen. VIII. c. 16). The bargain and sale operating under the Statute of Uses, and enrolled under the Statute of Enrolments in the High Court of Justice or with the *custos rotulorum* of the county, is no longer in use; a bargain and sale at common law is a mode of conveyance sometimes used by executors exercising a power of sale. Such a bargain and sale must be by deed since 8 and 9 Vict. c. 106, but need not be enrolled. There was no comprehensive legislative enactment dealing with all cases of sale of real estate until section 4 of the Statute of Frauds. Since that date a contract for the sale of real estate must be in writing (see FRAUD, where the provisions of the Act are set out). Sales by auction are within the statute, the auctioneer being the agent of both parties (see AUCTION). In an ordinary case of the sale of real estate the contract is formally drawn up on the basis of particulars and conditions of sale, which ought fairly to represent the actual state of the property. The statute, however, is satisfied by informal agreements, such as letters, if they contain the means of determining the property, the parties, and the price. The price must be a sum of money. If it is another estate, the contract is one of exchange; if no consideration passes, it is a gift. The price may be left to be determined by a third person, as by arbitration. For the way in which payment of the price may be made, see PAYMENT. The formation of a binding contract of sale is the most important stage in the transfer of real estate. From the moment at which the parties are bound by the contract the sale is made; the purchaser has the equitable estate in the subject-matter of the contract (see EQUITY), the vendor holding in trust for him, subject to the payment of the purchase money, for which the vendor¹ has a lien. The price becomes personal estate of the vendor and the land real estate of the purchaser. The latter has the right to accidental benefits and the burden of accidental losses accruing before completion of the purchase. The rights defined by the contract descend to the representatives of a deceased vendor or purchaser. In most cases the personal representative of a deceased vendor may convey the property under 44 and 45 Vict. c. 41, s. 4. After the contract it becomes the duty of the vendor to deliver an abstract of title, to satisfy the purchaser's reasonable requisitions as to any question arising on the title of the purchaser, and to pay a deposit, usually ten per cent. of the price fixed, within a certain time, the remainder being paid on completion,—that is, the execution of the conveyance and payment of the balance of the price. He also prepares the conveyance, which since 8 and 9 Vict. c. 106 must be by deed. The costs of execution of the conveyance are paid by the vendor. Any of these duties may be varied by special agreement. The sale is not in ordinary cases avoided because the purchaser is in default in payment of the purchase money on the day appointed. The purchaser does not forfeit his rights if he be ready to complete within a reasonable time after the day fixed for completion and to pay interest on the sum overdue. This rule is an old doctrine of equity, and is generally expressed by saying that time is not of the essence of the contract. As a general rule, any real estate is capable of sale, unless it is altogether *extra commercium*, as a church or public building. There are, however, a few exceptions introduced by the legislature, such as estates tail not barred, estates which by Act of Parliament are inalienable (see REAL ESTATE), and crown lands, of which all grants for more than thirty-one years are in general void by 1 Anne st. 1, c. 7. Sales of pretended titles to land are void by 32

¹ "Vendor" and "purchaser" are the words always used to denote the parties to a contract of sale of real estate. Where the sale is of personal estate, "buyer" and "seller" may be used as well.

Hen. VIII. c. 9. The sale of land to be held in mortmain would be void as contrary to the policy of the Mortmain Acts (see CHARITIES, CORPORATION). The rights and liabilities of vendors and purchasers have been considerably affected by recent legislation, the principal Acts dealing with the subject being the Vendor and Purchaser Act, 1874, and the Conveyancing Act, 1881. A period of forty years has been substituted for the period of sixty years previously necessary as the root of title,—that is to say, in most cases an abstract showing title for forty years is sufficient. In an abstract of title to leaseholds, the title is to commence with the lease or underlease, in an abstract of title to enfranchised lands, under a contract to sell the freehold, with the deed of enfranchisement. Recitals twenty years old are evidence, except so far as they can be proved to be inaccurate, and recitals of documents dated prior to the commencement of the abstract are to be taken as correct, and their production is not to be required. The expenses of evidence required in support of the abstract and not in the vendor's possession are thrown upon the purchaser. The Conveyancing Act, 1881, further protects the purchaser by implying in a conveyance by a beneficial owner on sale for valuable consideration covenants for right to convey, quiet enjoyment, freedom from encumbrances, and further assurance. In a conveyance of leaseholds a covenant for the validity of the lease is implied. These covenants protect the purchaser much in the same way as the implied warranty in the sale of personalty. The Act also gives the mortgagee, where the mortgage is by deed, the power of sale generally inserted in mortgage deeds (see MORTGAGE).

The remedies of the vendor are an action for the price or for specific performance according to circumstances. There is also a remedy by mandamus against public companies refusing to complete. Specific performance is a remedy introduced by the Court of Chancery to enforce contracts for the sale or purchase of real estate, it being considered that in such cases the common law action for damages was an insufficient remedy. Strictly, it is only an exercise by the court of its jurisdiction over trustees, the vendor being after the contract, as has been said, a trustee for the purchaser. By the Judicature Act, 1873, actions of specific performance are specially assigned to the Chancery Division. A county court has jurisdiction where the purchase money does not exceed £500. In spite of the Statute of Frauds, specific performance may in some cases be decreed where a parol contract has been followed by part performance and where the position of the parties has been materially altered on the faith of the contract. Actions for the price or for specific performance are subject to the purchaser's right to compensation for deficiency of quality or quantity or of the vendor's interest in the property. The question whether in a particular case the purchaser is entitled to rescind the contract or only to compensation is often a very difficult one. The remedies of the purchaser are an action for specific performance, for rescission of the contract or for damages (in case of fraud), for a return of the deposit, or for expenses. On the principle of *caveat emptor*, the sale is not avoided by mere commendatory statements, statements of opinion, or non-disclosure of patent defects. Non-disclosure of latent defects or material misrepresentation of facts, on the faith of which the purchaser entered into the contract, will as a rule be a ground for rescission or for damages, and this irrespective of fraud, as a contract for the sale of land is a contract *uberrimæ fidei*. Where the sale goes off or the vendor without fraud fails to make a good title, the purchaser can only recover the deposit, if any, and any expenses to which he may have been put; he cannot recover damages for the loss of his bargain. Certain frauds by a

vendor or his solicitor or agent in order to induce the purchaser to accept a title render the offender guilty of a misdemeanour, as well as liable to an action for damages (22 and 23 Vict. c. 35, s. 24). By the Vendor and Purchaser Act, 1874, either a vendor or a purchaser of real or leasehold estate in England may obtain on a summary application the decision of a judge of the Chancery Division on any question connected with the contract, not being a question affecting its existence or validity. (See Sugden, *Vendors and Purchasers*; Dart, *Vendors and Purchasers*; Fry, *Specific Performance*.)

Personal Estate.—At common law, as in the case of real estate, writing was not essential to the validity of a contract of sale. The common law is thus stated by Blackstone: "A contract of sale implies a bargain, or mutual understanding and agreement between the parties as to terms; and the law as to the transmutation of property under such contracts may be stated generally as follows. If the vendor says the price of the goods is £4 and the vendee says he will give £4, the bargain is struck; and, if the goods be thereon delivered or tendered, or any part of the price be paid down and accepted (if it be but a penny), the property in the goods is thereupon transmuted and vests immediately in the bargainee; so that in the event of their being subsequently damaged or destroyed he and not the vendor must stand to the loss. This supposes (it will be observed) the case of a sale for ready money; but, if it be a sale of goods to be delivered forthwith, but to be paid for afterwards, the property passes to the vendee immediately upon the striking of the bargain without either delivery on the one hand or payment on the other" (Stephen, *Commentaries*, vol. ii. bk. ii. pt. ii. ch. v.). Earnest may have been originally the same as the Roman *arrha*; it was never, however, part payment, as *arrha* might have been,—in fact, the Statute of Frauds specially distinguishes it from part payment. The giving of earnest has now fallen into disuse. The price need not be fixed; if not fixed, a reasonable price will be presumed. Though writing was in no case necessary at common law, it has become so under the provisions of various Acts of Parliament, prominent among which is the Statute of Frauds, ss. 4 and 17 (see CONTRACT, FRAUD). Section 17 of the Statute of Frauds was extended to executory contracts of sale by Lord Tenterden's Act, 9 Geo. IV. c. 14. The sale of horses in market overt must be entered in a book kept by the toll-keeper (2 and 3 Ph. and M. c. 7, 31 Eliz. c. 12). The sale of ships must by the Merchant Shipping Act, 1854, be made by bill of sale in a certain form. Contracts for the sale of shares in a joint-stock banking company are void unless the contract sets forth in writing the numbers of the shares on the register of the company or (where the shares are not distinguished by numbers) the names of the registered proprietors (29 and 30 Vict. c. 29). Bills of sale of goods must be in writing in a certain form and registered under the Bills of Sale Acts, 1878 and 1882.¹ As a general rule the property in goods passes by the contract of sale. This general rule is subject to the following important exceptions: (1) where the vendor is to do anything to the goods for the purpose of putting them into that state in which the purchaser is bound to accept them, the property does not pass until performance of the necessary acts; (2) the same is the case where the goods are to be weighed, tested, or measured; (3) where the purchaser is bound to do anything as a condition on which the passing of the property depends, the property does not pass until the condition is fulfilled, even though the goods may be actually in the possession of the buyer; (4) where an executory contract for the

¹ Bills of sale have been included here solely on account of their name; they are in reality mortgages.

sale of goods is made, the property does not pass until appropriation of specific goods by the vendor in completion of the contract; (5) where the vendor reserves to himself the *jus disponendi* or future power of dealing with the goods, as by making a bill of lading deliverable to his order, the property does not pass until the *jus disponendi* is exercised in favour of the purchaser; (6) where there is fraud on the part of the vendor or purchaser, the sale is voidable, not void; it may be affirmed and enforced or rescinded. In sales of personalty, unlike sales of real estate, time is usually of the essence of the contract. A sale of goods may be accompanied by an express warranty or collateral contract as to the title to or quality of the goods. No special form of words is necessary to create a warranty, nor need it be in writing. An implied warranty of title—that is, an affirmation that the vendor has a right to sell—exists certainly in executory contracts of sale. It most probably exists in executed contracts,¹ the exceptions to the rule having in recent times become by judicial decision more numerous than the cases falling under the old rule, that there was no such warranty. Warranty of quality exists either by statute or at common law. The Merchandise Marks Act, 1862, implies a warranty from the existence of trade-marks on chattels that the trade-mark is genuine, and from the existence of any statement respecting number, quantity, weight, place, or country that such statement is not in any material respect false. The rules as to warranty of quality at common law cannot be better stated than in the language of the clear and full judgment of the Court of Queen's Bench in *Jones v. Just* (*Law Reports*, 3 Queen's Bench, 197).

"First, where goods are *in esse* and may be inspected by the buyer, and there is no fraud on the part of the seller, the maxim *caveat emptor* applies, even though the defect which exists in them is latent and not discoverable on examination, at least where the seller is neither the grower nor the manufacturer. The buyer in such case has the opportunity of exercising his judgment upon the matter, and if the result of the inspection be unsatisfactory, or if he distrusts his own judgment, he may if he chooses require a warranty. In such a case it is not an implied term of the contract of sale that the goods are of any particular quality or are merchantable. So in the case of the sale in a market of meat which the buyer had inspected, but which was in fact diseased and unfit for food, although that fact was not apparent on examination and the seller was not aware of it, it was held that there was no implied warranty that it was fit for food, and that the maxim *caveat emptor* applied. Secondly, where there is a sale of a definite existing chattel specifically described, the actual condition of which is capable of being ascertained by either party, there is no implied warranty. Thirdly, where a known described and defined article is ordered of a manufacturer, although it is stated to be required by the purchaser for a particular purpose, still if the known described and defined thing he actually supplied there is no warranty that it shall answer for the particular purpose intended by the buyer. Fourthly, where a manufacturer or dealer contracts to supply an article which he manufactures or produces, or in which he deals, to be applied to a particular purpose, so that the buyer necessarily trusts to the judgment or skill of the manufacturer or dealer, there is in that case an implied warranty that it shall be reasonably fit for the purpose to which it is to be applied. In such a case the buyer trusts to the manufacturer or dealer, and relies upon his judgment and not upon his own. Fifthly, where a manufacturer undertakes to supply goods manufactured by himself or in which he deals, but which the vendee has not had the opportunity of inspecting, it is an implied term in the contract that he shall supply a merchantable article. And this doctrine has been held to apply to the sale of an existing barge by the dealer which was afloat but not completely rigged and furnished; there, inasmuch as the buyer had only seen it when built and not during the course of the building, he was considered as having relied on the judgment and skill of the builder that the barge was reasonably fit for use."

The case of sale by sample is peculiar to personalty.

In such a sale the vendor warrants the quality of the bulk to be equal to that of the sample. There are certain kinds of sale which are governed by special legislation, chiefly on grounds of public policy. A sale contrary to the provisions of any of the Acts is generally void in the same way as though it were illegal at common law, on the principle of the maxim *Ex turpi causa non oritur actio*. The sale of certain public offices is forbidden by 5 and 6 Edw. VI. c. 16, 49 Geo. III. c. 126, and other Acts dealing with special offices. A sale by a tradesman in the way of his ordinary business upon Sunday is illegal under 29 Car. II. c. 7. The same is the case with the sale of intoxicating liquors during prohibited hours, whether on Sundays or week days (31 and 38 Vict. c. 49, s. 6). No action can be brought to recover any debt alleged to be due in respect of the sale of any ale, &c., consumed on the premises where sold (30 and 31 Vict. c. 142). The sale of game in the close season or by an unlicensed person is forbidden by 1 and 2 Will. IV. c. 32. The sale of spirits to a person apparently under the age of sixteen is made penal by 35 and 36 Vict. c. 94, s. 7. These cases are only given as examples; there are numerous other enactments dealing with, *inter alia*, sales of anchors and chain cables, adulterated food and drugs, explosives, and poisons. Every sale by weight or measure must be according to one of the imperial weights or measures ascertained by the Weights and Measures Act, 1878; if not so made, the sale is void (41 and 42 Vict. c. 49, s. 19).

The remedies of the vendor are of two kinds, judicial against the purchaser, extra-judicial against the goods. Judicial remedies are either by action for non-acceptance where the property has not passed or by action for the price where it has passed. The extra-judicial are (1) a lien for the price, so that, in the absence of agreement to the contrary or assent to a sub-sale, the vendor need not deliver the goods until the price is paid; (2) the right of stoppage *in transitu*. This right is universally acknowledged by the commercial law of civilized nations. It arises on the insolvency of the purchaser before the goods have reached his possession, and is defeasible only by transfer, whether by way of sale or pledge, of the bill of lading or other document of title to a *bona fide* indorsee for value. The protection afforded at common law to the *bona fide* transferee has been extended by the Bills of Lading Act, 1855, and by the Factors Act, 1877. There is no general right of resale by the vendor on default of the purchaser. The remedies of the buyer are an action for damages for non-delivery, for conversion, for breach of warranty, for misrepresentation, &c., according to circumstances. He has also a remedy analogous to specific performance under the Mercantile Law Amendment Act, 1856. The Act gives power to the court or a judge, in an action for breach of contract to deliver specific goods, to order execution to issue for the delivery of the goods without giving the defendant the option of retaining them upon paying the damages assessed. The buyer has further a right to reject goods where they are different in kind or quality from those which he had a right to expect. He is entitled to keep them for a sufficient time to give them a fair trial. It should be noticed that the effect of misrepresentation in the sale of real and personal property is not the same. As a rule innocent misrepresentation of facts does not give a right to rescind the sale, since a representation is, like an express warranty, not an integral part of the contract. A representation may, however, if so intended by the parties, become a condition a breach of which will avoid the sale. See Story's, Blackburn's, and Benjamin's treatises on the sale of personal property, especially Benjamin's, which is now the recognized textbook on the subject.

¹ An executed contract passes title, an executory gives a right. A purchase for ready money in a shop is an executed contract, an order for a certain chattel to be made is an executory contract. The consideration for such a contract is the express or implied promise to pay for the chattel on completion.

It may be useful to recapitulate shortly the main points of difference between Roman and English law. They have all been noticed in the preceding part of this article. (1) *Arrha* was not the same as earnest. (2) Written contracts were not necessary in Roman law under any circumstances. (3) There was no warranty of title in Roman law: the transfer was of *vacua possessio*, not of ownership; in England there is a warranty of title (unless the parties otherwise intend) on sales of personalty, but not on sales of real property, though the covenants for title practically amount to a warranty. (4) There was a warranty of quality extending to undisclosed defects in Roman law beyond anything recognized by English law. (5) By Roman law the property did not pass until *traditio*; even then it was only property in a modified sense; it was rather *vacua possessio* secured by *duplex stipulatio*; by English law the property in specific ascertained goods vests by the contract in the buyer. (6) A sale by a person who was not the owner was not good in Roman law; it is good in certain cases in English law (see below).

There are certain kinds of sale which it is proposed to consider separately on account of the exceptional circumstances in which they stand.

Compulsory Sale.—As a general rule sale is a matter of contract between the parties, and no one can be forced to sell against his will. But in this, as in other matters, the right of the state comes in. Under the powers of the Lands Clauses and other Acts the state, exercising its right of eminent domain, may force an owner to sell for the purpose of public improvements,—such as railways. The power of compulsory sale is less common where the interests of the state are not involved; an example occurs in the Partition Act, 1868, under which the court may order a sale instead of a division, even though some of the parties interested dissent.

Judicial Sale.—Under this head may be grouped all those sales which are made under the authority and by the direction of a court of justice. In regard to real property the most important example is the sale by order of the Chancery Division. Such a sale may be ordered either under the original jurisdiction of the court or under the provisions of certain Acts of Parliament, such as the Lunacy Regulation Act, 1853, the Partition Act, 1868, the Settled Estates Act, 1877, or the Settled Land Act, 1882 (see SETTLEMENT). The Conveyancing Act, 1881, provides for freeing any land from encumbrances on sale by the court, on payment into court of a sum to meet the encumbrance. The Act also makes the order for sale conclusive in favour of a purchaser in almost every case. The abstract of title in a sale by the court is submitted to one of the conveyancing counsel of the Chancery Division, and the particulars and conditions are settled in judges' chambers. The sale is generally by public auction, the auctioneer being appointed by the judge. The regulations for the conduct of sales by the court will be found in the Rules of the Supreme Court, 1883, Ord. li. r. 1-13.

The Bankruptcy Act, 1883, gives power to a trustee acting under the authority of a court of bankruptcy to sell all or any part of the property of a bankrupt by public auction or private contract. Similar rights are given by the Scotch Bankruptcy Act, 1856. Judicial sales of the property of a debtor in Scotland are regulated by 19 and 20 Vict. c. 92. The term "judicial sale" does not seem to be used as a technical term in English as it is in Scotch law. In admiralty actions a vessel may be sold under a commission of appraisement and sale issued by the court. The practice is now regulated by Ord. li. r. 14-16. Similar powers may be exercised in an action of sett in Scotland. A common instance of a judicial sale is the sale by a sheriff of an execution debtor's goods under a writ of *feri facias* or *venditioni exponas*. Where the execution is for a sum above £20 the sale is, unless the court otherwise orders, to be by public auction. Where the sheriff has seized and a claim by interpleader is set up, the court may order a sale of the whole or part of the goods (Rules of the Supreme Court, 1883, Ord. lvii. r. 12). The same rules (Ord. l. r. 2) give a valuable power to the court or a judge of ordering a sale of any goods of a perishable nature, or such as for any reason it may be desirable to have sold at once.

Sale by Persons not Owners.—English law in general agrees with the rule in Dig. l. 17, 54, "*Nemo plus juris ad alium transferre potest quam ipse haberet*," and a purchaser takes his purchase subject to informalities in the title. To this rule there are several exceptions, in which title may be given by persons who are limited owners or not owners at all. An example of sale by a limited owner is a sale by a tenant for life under the powers given by the Settled Land Act, 1882. Under the same head would fall sales by persons having a qualified right of sale under particular circumstances, such as a sheriff, the master of a ship in a foreign port, or

a pawnee in default of payment (see PLEDGE). Sales by persons not owners at all must as a rule, in order to be valid, be made to purchasers ignorant of the defect of title on the part of the vendor. In the case of real estate a *bona fide* purchaser for valuable consideration without notice, actual or implied, of any adverse title is protected. This is on the principle that equity assists the person in possession of the legal estate. In the case of personal property title may be passed by a person not owner under the Factors Acts and in the case of stolen goods. The effect of the Factors Acts is to enable title to be given by the vendor or vendee or any person on his behalf while he is in possession of the documents of title (see FACTORS). The law as to the sale of stolen goods will be found under THEFT.

Pre-emption.—This is a right of purchasing some particular property given to some particular person in priority to the public. It is conferred either by agreement between parties or by law. Thus by the Lands Clauses Act, 1845, before the promoters of an undertaking dispose of superfluous lands not required for the purposes of the undertaking they must (with certain exceptions) first offer to sell the same to the person then entitled to the lands from which the same were originally severed. In the United States pre-emption is very important in its connexion with the homestead law (see HOMESTEAD). In international law the right is exercisable by a belligerent nation over property not strictly contraband, but which would still be of advantage to the enemy. The goods are not seized and condemned, but purchased by the capturing nation at a reasonable compensation. The right of pre-emption is given to the admiralty by 27 and 28 Vict. c. 25, s. 38 (see CONTRABAND). The old crown prerogative of purveyance and pre-emption was a right of buying up provisions and other necessities for the royal household at a valuation even without the consent of the owner, and also of impressing horses and carriages for the king's service on the public roads upon paying a settled price to the proprietor. The right was relinquished by the Act abolishing the feudal tenures (12 Car. II. c. 24).

Scotland.—The law of Scotland follows the Roman law more closely than does English law. Thus in Scotch as in Roman law the contract of sale is called a consensual contract; the sale is not complete until delivery, and market overt does not afford any protection. Writing is essential to the sale of heritable property, not by any statute, as in England, but by the ancient unwritten law. *Rei interventus* may, however, in some cases, like part performance in England, supply the place of writings. The vendor is bound on completion to supply a sufficient progress of titles. In addition to the protection afforded to the purchaser by the progress of titles the statutory form of warrandice in 31 and 32 Vict. c. 101, s. 8 implies, unless specially qualified, absolute warrandice as regards the lands and writs and evidents, and warrandice from fact and deed as regards the rents,—that is to say, that a good title to the land has been conveyed, and that the grantor has not done and will not do anything contrary to the writ as regards the rents (see Watson, *Law Dict.*, s.v. "Warrandice"). In the case of movables writing is not necessary for a good contract of sale, except where the sale is of a ship, or the parties agree to reduce the terms to writing. The Mercantile Law Amendment (Scotland) Act, 1856 (19 and 20 Vict. c. 60), has made important changes in the law of Scotland. "The statute was passed for the purpose of assimilating the law of Scotland to that of England" (Lord Watson, in *M'Bain v. Wallace*, *Law Reports*, 6 Appeal Cases, 588). By section 1 goods after sale but before delivery are not attachable by the creditors of the seller. By section 2 the sub-purchaser may demand that delivery be made to him instead of to the original purchaser, without prejudice to the right of retention of the seller. By section 3 the seller of goods may attach the goods while in his own possession at any time prior to the date when the sale of such goods shall have been intimated to him. By section 5 the English principle of *caveat emptor* is introduced: "where goods shall be sold the seller, if at the time of the sale he was without knowledge that the same were of defective or of bad quality, shall not be held to have warranted their quality or sufficiency, but the goods, with all faults, shall be at the risk of the purchaser, unless the seller shall have given an express warranty of the quality or sufficiency of such goods, or unless the goods have been expressly sold for a specified and particular purpose, in which case the seller shall be considered, without such warranty, to warrant that the same are fit for such purpose." The right of retention corresponds closely to the right of lien in England, but rests upon the simpler ground of undivested property (see Watson, *Law Dict.*, s.v. "Sale"). Criminal liability for fraud seems to be carried farther in Scotland than in England (see FRAUD).

United States.—The law as to the sale of real estate agrees generally with English law. It is considerably simplified by the system of REGISTRATION (*q.v.*). The covenant of warranty, unknown in England, is the principal covenant for title in the United States. It corresponds generally to the English covenant for quiet enjoyment. The right of judicial sale of buildings under a mechanic's lien for labour and materials is given by the law of many States.

The sale of public lands is regulated by Act of Congress (*Revised Statutes*, 2353-2379). In the law of sale of personal property American law is also based upon English law. The principal differences are that the law of market overt (see THEFT) is not recognized by the United States, and that an unpaid vendor is the agent of the vendee to resell on non-payment, and is entitled to recover the difference between the contract price and the price of resale. The law of Louisiana (*Civil Code*, § 3194) gives the unpaid vendor a still greater right in his preferential claim for the price against the creditors of the purchaser, if the property still remains in the latter's possession. Warranty of title is not carried as far as in England. United States decisions draw a distinction between goods in the possession and goods not in the possession of the vendor at the time of sale. There is no warranty of title of the latter. The Statute of Frauds has been construed in some respects differently from the English decisions. The differences will be found in Mr Benjamin's work. As to unlawful sales, it has been held that a sale in a State where the sale is lawful is valid in a State where it is unlawful by statute, even though the goods are in the latter State. (J. Wt.)

SALEIYER (in Mancassarese *Siláyara*, in Buginese *Silája*), also called *Tana-dowang* ("Land of Shrimps"), is a Dutch island separated from the south coast of Celebes (East Indies) by a strait 8 miles wide, which in the west monsoon is used by vessels bound for the Moluccas, the Philippines, and China. With a length of 46 miles and general breadth of 9, the area is estimated at 315 square miles. Along the east side of the island is a belt of volcanic rock; the west side is of limestone or coralline formation. The highest point seems to be Haru on the east coast, but estimates of its altitude vary from 1000 to 3000 feet. There are no navigable rivers, and many of the streams dry up in the west monsoon. Besides most of the ordinary tropical fruits, the cultivated plants comprise Indian corn, barley, potatoes, tobacco, coffee, and indigo, and among the trees are cocoanut and areng palms, *kanari*, ebony, and teak (the last considered the property of the Dutch Government). Horses, buffaloes, goats, and sheep are kept, and pigs and deer exist in a wild state. The population of Saleiyer and dependencies, mainly a mixed race of Mancassars, Buginese, and natives of Luvu and Buton, was in 1869 55,147, and in 1880 66,276. They use the Mancassar language, are for the most part nominally Mahomedans (though many heathen customs survive), and support themselves by agriculture, fishing, seafaring, trade, the preparation of salt (on the south coast), and the weaving of clothing materials. Field work is largely performed by a servile class. Raw and prepared cotton, tobacco, trepang, tortoise-shell, cocoanuts and cocoanut oil, and salt are the principal articles of export.

The island is divided into nine regencies:—Tanette, Batammata (Batangmata; including the former regency of Onto), Buki, Mare-Mare, Bonéya—all five in the north—Bontobangung, Balla-bulo, Layolo, and Barambarang—in the south. Panggiliyang or Benteng on the west coast, often called also Saleiyer, is the capital of the island. It stands in 6° 3' 3" S. lat. and 120° 31' 48" E. long., and possesses the best harbour on the whole coast, being protected by Pulo Pasi or Hog Island (also Sariwa or Pulo Babi). To the Saleiyer group belong a variety of small islands, for the most part uninhabited—Tana Jampéya (the largest of all with a good anchorage at Maringi Bay), Gowang, Malimbu, &c. Previous to the Dutch occupation the Saleiyers were subject to the king of Ternate.

SALEM, a British district of India, in Madras presidency, lying between 11° 1' and 12° 57' N. lat. and 77° 32' and 79° 5' E. long. It embraces an area of 7653 square miles, and is bounded on the N. by Mysore and North Arcot, on the S. by Coimbatore and Trichinopoly, on the E. by Trichinopoly and South and North Arcot, and on the W. by Coimbatore and Mysore. Except towards the south, the district is very hilly, with large plains lying between the several ranges. Salem is described as consisting of three distinct tracts of country, known as the Tálaghát, the Báramahál, and the Bálaghát. The Tálaghát is situated below the Eastern Ghats on the level of the Carnatic generally; the Báramahál includes the whole Salem face of the Ghats and a wide tract of country at their base; and the

Bálaghát is situated above the Ghats on the tableland of Mysore. The western part of the district is very mountainous, some of the ranges attaining an elevation of between 5000 and 6000 feet. Amongst the chief ranges are the Shevaroyes, the Kalráyans, the Melagiris, the Kollimalais, the Pachamalais, and the Yelagiris. The chief rivers are the Cauvery with its numerous tributaries, and the Pennar and Palar; the last, however, only flows through a few miles of the Tirupatúr *táluk*, situated in the north-western corner of the district. The forests are of considerable value and their area is roughly estimated at 2251 square miles. The geological structure of the district is mostly gneissic, with a few irruptive rocks in the form of trap dykes and granite veins. Magnetic iron ore is common in the hill regions, and corundum and chromate of iron are also obtainable. The qualities of the soil differ very much; in the country immediately surrounding the town of Salem a thin layer of calcareous and red loam generally prevails, through which quartz rocks appear on the surface in many places. The climate, owing to the great difference of elevation, varies considerably; on the hills it is cool and bracing, and for a great part of the year very salubrious; the average rainfall is about 38 inches. Salem has about 1400 miles of road, and the length of railway line within the district is 134 miles.

In 1881 the population was 1,599,595 (males 778,483, females 821,112); Hindus numbered 1,531,855, Mohammedans 51,092, and Christians 16,567. Besides Salem (see below), the capital, the district contains three other towns with a population exceeding 10,000 each, viz., Daringambadi (15,426), Tirupatúr (14,278), and Shendamangalam (12,575). Of the total area of the district only 1,283,190 acres were under cultivation in 1883-84; but of these 187,403 acres were twice cropped. The staple crops are rice and ragi; other important crops are pulses and seeds. The chief industry is weaving, which is carried on in almost every large town and village. Carpets of great beauty and superior workmanship are made in the Salem jail. Good iron and steel are made, but only on a small scale. The gross revenue of the district in 1883-84 was £260,364, the land-tax contributing £211,062 of the amount. Though Salem has no connected history, there are few parts of Southern India that contain more spots of interest for English students. As at present composed it was acquired by the treaty of peace with Tipu Sultan in 1792 and the partition treaty of Mysore in 1799. By the former the Tálaghát and Báramahál were ceded, and by the latter the Bálaghát, or what is now the Osúr *táluk*.

SALEM, chief town of the above district, situated in 11° 39' 10" N. lat. and 78° 11' 47" E. long., is a busy trading place, with a considerable weaving industry. It is tolerably well built and is prettily situated on the river Tirumanimuttar, 900 feet above sea-level, in a long valley enclosed by the Shevaroy hills, which are 6 miles distant. The population of the town in 1881 was 50,667 (males 24,584, females 26,083).

SALEM, a city of the United States, capital of Essex county, Massachusetts, is built on a peninsula between North and South rivers, in 42° 31' 18" N. lat. and 70° 53' 53" W. long., 16 miles north by east of Boston, on the eastern division of the Boston and Maine Railroad. In the latter part of the 18th and the early part of the 19th century Salem was the seat of a flourishing foreign commerce, especially with the East Indies; but, its comparatively shallow harbour failing to accommodate the larger vessels of modern times, it has been supplanted by Boston and has to content itself with a good share of the coasting trade. Its industrial activity has, on the other hand, increased, and it now possesses steam cotton-mills, jute-factories, extensive tanneries, and various minor manufactories. The main interest, however, of Salem consists in its historical and literary associations and the institutions by which they are represented. Best known of these institutions is the Peabody Academy, founded in 1867 with funds provided by the well-known philanthropist. The academy at once purchased and refitted the East India Marine Hall, origin-

ally built in 1824 by the East India Marine Society (1799), which consisted of captains and supercargoes who had doubled either Cape Horn or the Cape of Good Hope; and the building now contains under the trusteeship of the academy the collections of the old East India Museum and those of the Essex Institute, illustrating the zoology, natural history, and archaeology of the county. The ethnographical collections, such as that dealing with Corea, are especially valuable. The *American Naturalist* has been the organ of the academy since 1867. The Peabody Institute, not to be confounded with the academy, is in the village of Peabody (Danvers), about 2 miles distant from Salem and about midway between the house in which the philanthropist was born and the grave, in Harmony Grove cemetery, in which he was buried. Plummer Hall, a fine building in Essex Street, erected in 1856 out of funds left to the Salem Athenæum by Miss Plummer, contains the libraries of the Athenæum, the Essex Institute (founded in 1848 by the union of the Essex Historical and the Essex County Natural History Societies), and the Essex South District Medical Society, making an aggregate of 50,000 volumes. Behind this hall is the frame of the oldest church edifice in New England, erected in 1634 for Roger Williams. Other buildings of note in Salem are a State normal school, the city hall, the court-houses, the custom-house, in which Nathaniel Hawthorne once acted as surveyor of the port, and several of the private houses (such as "Dr Grimshawe's house," the dwelling occupied for several years by Dr Peabody, Mrs Hawthorne's father) which, while not exactly prototypes, have lent much of their verisimilitude to the localities of Hawthorne's fiction. The novelist was born at 21 Union Street. Salem had 24,117 inhabitants in 1870, and 27,563 in 1880.

Naumkeag (Eel Land) was the Indian name of the district in which Salem stands, and is still used familiarly by the inhabitants. The first house was built by Roger Conants from Cape Ann in 1626, and two years later a settlement was formed by John Endicott and called Salem, "from the peace they had and hoped in it." In 1630 Governor John Winthrop introduced a large body of colonists from England, including the brave and beautiful Arabella Johnson, daughter of the earl of Lincoln, who died shortly afterwards. In 1661 the Quakers were persecuted at Salem, and in 1692 the town was the scene of Cotton Mather's terrible proceedings against witchcraft: nineteen persons were hanged on Gallows Hill and Giles Cory was pressed to death. It was in Salem that in 1774 the house of representatives of Massachusetts resolved themselves into a sovereign political power. The town obtained a city charter in 1836. Few cities of the United States have given more eminent men to the world. Timothy Pickering, secretary of state (1795-1800), General Israel Putnam, F. T. Ward of China celebrity, John Rogers and W. W. Story the sculptors, Bowditch and B. Peirce the astronomers and mathematicians, Maria S. Cummins the novelist, W. H. Prescott the historian, and Nathaniel Hawthorne.

SALEM, a city of the United States, the county seat of Salem county, New Jersey, on a small stream of the same name, by which it has steam communication with Philadelphia (on the Delaware), 44 miles distant to the north-north-east by rail. While Salem depends mainly on the agricultural prosperity of the surrounding district, it also contains foundries and machine-shops, fruit-canning establishments, glass-ware factories, oil-cloth factories, &c. The population was 3052 in 1850, 4555 in 1870, and 5056 in 1880.

A colony settled on the site of Salem in 1641 was replaced by a Swedish fort, and this passed through the Dutch to the English. One of the Quakers who in 1673 bought Lord Berkeley's half of New Jersey gave the place its present name and restored the settlement, which in 1682 was declared a port of entry. In 1778 the town was plundered by Colonel Manhood.

SALEM, a city of the United States, the capital of Oregon, in Marion county, on the east bank of Willamette river, 53 miles south of Portland by the Oregon and California Railroad. It lies in a fertile prairie district, adorned with copses, and possesses a good source of water-power in Mill Creek. The capitol, a rather imposing edifice

with a tower 180 feet high, erected in 1875-76, occupies a fine site above the city; other public buildings are the Willamette University (Methodist), which grants degrees in medicine, science, and general literature, the opera-house, the Roman Catholic school for girls, the State penitentiary, and State schools for the deaf and dumb and the blind. Lumber, woollen goods, flour, leather, brass castings, furniture, linseed oil, and building materials are the chief articles of manufacture and trade. The population was 2538 in 1880. Settled in 1834, incorporated in 1853, Salem became the State capital in 1860.

SALEP (Arab. *sahleb*, Gr. *σρχυς*), a drug extensively used in the East as a nervine restorative and fattener, and also much prescribed in paralytic affections, probably owed its original popularity to the belief in the so-called "doctrine of signatures." In Europe it is chiefly used as a demulcent drink, but is also supposed to possess nutrient properties; it may be employed with advantage in inflammatory conditions of the mucous membrane, as in bronchitis, diarrhoea, cystitis, and other urinary disorders. It consists of the tuberous roots of various species of *Orchis* and *Eulophia*, which are decorticated, washed, heated until horny in appearance, and then carefully dried. The most important constituent of salep is a kind of mucilage which it yields to cold water to the extent of 48 per cent. This mucilage in its chemical reactions is more nearly allied to cellulose than to gum, since when dry it is readily soluble in ammoniacal solution of copper; when boiled with nitric acid it yields oxalic but not mucic acid. Salep also contains sugar and albumen, and when fresh traces of a volatile oil; dried at 100° C. it yields 2 per cent. of ash, chiefly the phosphates and chlorides of potassium and calcium.

Salep was formerly imported into Europe from the Levant, but in 1760 the French chemist Geoffroy discovered its true nature and showed how it might be prepared from the species of *Orchis* indigenous to France. That used in Germany is obtained from plants growing wild in the Taunus Mountains, the Westerwald, the Rhön, the Odenwald, and Franconia. Grecian salep is chiefly collected in Macedonia. In Asia Minor the tubers are collected near Melassa and Mughla, and about 330 tons are annually exported from Smyrna. The salep of the Bombay market, which is imported principally from Persia, Cabul, and northern India, occurs in three forms, palmate, large ovoid, and small ovoid tubers on strings, all more or less horny and translucent. Salep is also produced on the Nilgiri (Neilgherry) Hills and in Ceylon. Besides the above-mentioned forms, elongated cylindrical tubers, usually in pairs and undecorticated, are occasionally met with. The palmate tubers are the most highly esteemed, being valued at ten rupees per pound. This variety is known in the Bombay market as Persian salep. It is probably derived chiefly from *O. latifolia*, L., although *O. maculata*, L., *O. saccifera*, Brongn., and *O. conopsea*, L., also afford palmate tubers. The species known to yield ovate salep are *O. mascula*, *O. Morio*, *O. pyramidalis*, *O. ustulata*, *O. militaris*, *O. coriophora*, L., and *O. longicurris*, Link. All these species are natives of the greater part of central and southern Europe, Turkey, the Caucasus, and Asia Minor, *O. latifolia* extending to western India and Tibet and *O. conopsea* to the Amur, in the extreme east of Asia. Salep is not easily reduced to powder, being both hard and tough, and is therefore usually ground between millstones. This difficulty is said to be lessened if the salep is first soaked in cold water until soft and then rapidly dried. As the powder does not mix readily with water, the authors of *Pharmacographia* (2d ed. p. 656) recommend that it should be first mixed with 1½ parts of rectified spirits of wine (brandy or other strong spirit would answer equally well), 40 parts of cold water being then added quickly and the mixture boiled. In these proportions salep affords a thick jelly.

SALERNO, a city of Italy and the chief town of a province of its own name (formerly Principato Citeriore), is beautifully situated on the west coast 34 miles south-east of Naples, and presents a fine appearance with the ruins of its old Norman castle on an eminence 905 feet above the sea and its background of graceful limestone hills. The town walls were destroyed in the beginning of the 19th century; the seaward portion has given place to the Corso Garibaldi, the principal promenade. Among the conspicuous buildings are the theatre, the prefecture, and the

mistakable evidence of a connexion between the Sigambri and the Salii¹ that the latter are by some regarded as the descendants of the Sigambri whom Tiberius removed in 8 B.C. from their home on the right bank of the Rhine; and it is argued that he did not transform them into the Gugerni, nor place them on the Merwede, a stream and locality near Dordrecht and Zwijndrecht, but transplanted them into the region now called the Veluwe, between the Utrecht Vecht and the Eastern Yssel, where the Romans probably made of them what the Batavi had been for years past—their allies—perhaps on the same condition as the latter, who merely furnished the Romans with men and arms. This accounts for the Sigambrian cohort in the Thracian War in 26 A.D. Some think, however, that the Salians were a separate tribe of the Franks who merely coalesced with the Sigambri (comp. Watterich, *Die Germanen des Rheins*; Waitz, *Verfass.*, ii. 24). In 431 the Frankish (Salic) king Chlodio (Chlojo, Chlogio), said to have been a son (or the father) of Merovech, the founder of the Merovingian dynasty (Greg. Tur., ii. 9), took Cambrai and advanced his dominion as far as the Somme (Greg., *ib.*; Sid. Apoll., v. 211 *sq.*), though still acknowledging Roman supremacy. Childerich reigned from 457 to 481, and resided at Tournai, where his grave was discovered in 1653. His son Clovis (Chlovis, Chlodovech) in 486 extended his empire to the Seine (Greg. Tur., ii. 43, 27). For an account of him, see vol. ix. pp. 528, 529.

We have very few means of ascertaining when the Salic Law² was compiled, and how long it remained in force. Our knowledge of the code is derived—(i.) from ten texts, preserved in a comparatively large number of manuscripts, chiefly written in the 8th and 9th centuries; (ii.) from allusions to a Salic Law in various charters and other documents. But the Latin texts do not contain the original Salic Law. This is clear (a) from the allusions we find in them to a “Lex Salica” and “Antiqua Lex,” which can hardly be anything but references to another and earlier Lex Salica; (b) from a certain peculiarity and awkwardness in the construction of the Latin, which, though it is so-called Merovingian, and therefore very corrupt, would have been different if the texts were original compilations; (c) from a number of words, found in nearly every paragraph of certain groups of the MSS., and now known as “Malberg glosses,” which are evidently the remains of a vernacular Salic Law, and appear to have been retained in the Latin versions, in some cases because the translators seemed doubtful as to whether their Latin terms correctly rendered the meaning of the original, in other cases because these words had become legal terms, and indicated a certain fine. We do not know whether the original Frankish law-book was ever reduced to writing, or merely retained in, and handed down to posterity from, the memory of some persons charged with the preservation of the law. All that we know of such an original is contained in a couple of prologues (apparently later than the texts themselves) found in certain MSS. of the existing

Latin versions. One of them states that four men “in villis quæ ultra Renum sunt per tres mallos (judicial assemblies) convenientes, omnes causarum origines sollicitè discutiendo tractantes, iudicium decreverunt,” which must refer to a period before 358, as in that year the Salian Franks had already crossed the Rhine and occupied the Batavian island and Toxandria. Another prologue says that the Salic Law was compiled (*dictare*) while the Franks were still heathens (therefore before 496), and afterwards emended by Clovis, Childebert, and Chlotar. Nor can it be stated with certainty when the Latin translations which we now possess were made, but it must have been after Clovis had extended his power as far as the Loire (486-507), as in chapter 47 the boundaries of the Frankish empire are stated to be the Carbonaria Silva (in southern Belgium between Tournai and Liège) and the Loire.³

There exist five Latin recensions, more or less different. (i.) The earliest of the code (handed down in four MSS. with little difference, and very likely compiled shortly after Clovis extended his empire to the Loire) consists of sixty-five chapters (with the Malberg glosses). In the course of the 6th century a considerable number of chapters appear to have been added (under the title of “edicts” or “decrees”), some of which are ascribed to Clovis, and the remainder to his successors before the end of the century. One of them (chap. 78) may with some certainty be ascribed to Hilperic (c. 574). Some others seem to have originated with Childebert I. and Chlotar I. (whose joint reign lasted from 511 to 558), and are known collectively as “Pactus Childeberti et Chlotharii.” From internal evidence we may infer that this first version dates from a time when Christianity had not yet become general among the Franks. (ii.) Two MSS. contain a second recension, having the same sixty-five chapters (with the Malberg glosses) as the first, but with numerous interpolations and additions, which point to a later period. Especially may this be said of the paragraph (in chap. 13) which pronounces fines on marriages between near relatives, and which is presumed to have been embodied in the Lex Salica from an edict of Childebert II. issued in 596. In chapter 55 paragraphs six and seven speak of a “basilica,” of a “basilica sanctificata,” and of a “basilica ubi requiescunt reliquæ,” but it is more than doubtful whether we have here any evidences of Christianity, though a later recension (the fourth) altered “basilica” into “ecclesia,” the “reliquæ” into “reliquæ sanctorum,” and thereby gave a decidedly Christian aspect to the clause. (iii.) A third recension is contained in a group of nine MSS. (divided into two classes), three of which have the same text (with the Malberg glosses) as the MSS. of the first and second recensions, divided, however, systematically into ninety-nine chapters, while the other six MSS. have the same ninety-nine chapters, with very little difference, but without the Malberg glosses. This text seems to have been arranged in Pippin’s or Charlemagne’s reign (c. 765-779). The clause on marriages between near relatives mentioned above is not found in this recension. On the other hand, we find in chapter 55 (= 77) fines pronounced on the murder of a presbyter and deacon (no bishop yet mentioned), while the six MSS. of the second class do not contain chapter 99 (“De Chrenecruda”), but merely say that the symbolism described in that chapter had been observed in heathen times, and was to be no longer in force. (iv.) The fourth version (handed down in a great number of MSS., and embodying in seventy chapters substantially the whole of the previous versions) is usually called *Lex Salica Emendata*, as the text bears traces of having been emended (by Charlemagne), which operation seems to have consisted in

¹ “Detonsus Vachalim [the river Waal] bibat Sicamber” (Sid. Apoll., *Carmin.*, xiii. 31). “Ut Salius jam rura colat flexosque Sicambri In falcem curvent gladios” (Claudian, *De Laude Stilic.*, i. 222). According to the *Gesta Franc.*, c. 1, the Franks at one time inhabited the town of Sicambria. The earliest Frankish kings, who were undoubtedly kings of the Salian Franks, are often called Sigambri, and always with the object of honouring them. St Remigius, when he baptized Clovis, exhorted him, “Mitis depona colla Sicamber” (Greg. Tur., ii. 31). Venantius Fortunatus (vi. 4) says to King Childebert, “Cum sis progenitus clara de gente Sygamber.” For further evidence, comp. Waitz, *Verfass.*, ii. 22 *sq.*

² The origin of the name Salicus, Salius, is uncertain. It is not improbable that it was derived from the river Yssel, called in the Middle Ages Isloa, Hisloa, Isla, Isalia. The region about Deventer, in the east of Holland, is still called Salland, though it is nowhere expressly said that the Salians ever lived there.

³ Some explain *Ligeris* to be the river Leye, a branch of the Scheldt, in which case the compilation would fall between c. 453 and 486.

eliminating the Malberg glosses from the text, correcting the Latin, omitting a certain number of paragraphs, and inserting some new ones. In chapter 55 the bishop is mentioned with the presbyter and the deacon. (v.) Finally, we have a fifth text, which seems an amalgamation of the previous recensions, more especially of the second, third, and fourth, but here and there with considerable differences. It was published in 1557, at Basel, by Bas. Joh. Herold (*Originum ac Germanicarum Antiquitatum Libri*); but no trace of the Fulda and other MSS. which the editor says that he used has hitherto been found.

The Salic code consists of enactments regarding procedure in lawsuits (chaps. 1, 18, 26, 37, 46-53, 56, 57, 60), judicial fines and penalties for various kinds of theft and kidnapping (2-8, 10-12, 21-23, 27, 28, 33-35, 38-40, 55, 61), for offences, injuries, &c., to persons, animals, and property (9, 15-17, 19, 20, 24, 25, 29-32, 36, 41-43, 64, 65); it regulates the "wergeld" (a word found only in the text published by Herold; all the other texts have *teodis*, *teudis*=people, associate of the people) of all classes of persons living under the Salic Law (41-43, 54, 63), the share of the kindred in the composition for homicide (58-62), the devolution of property and inheritance (59), migration from one village to another (45), &c.

The Salic Law speaks of—(a) freeborn persons (*ingenuus Francus*, *Salicus Francus*), with a wergeld of 200 solidi, which was tripled when such a person served in the army, and the latter amount again tripled when the person killed was an officer of the king; (b) serfs (*leii* or *liti*), who enjoyed personal freedom though belonging to some master, and (c) *pueri regis* (probably serfs in the service of the king), both with a wergeld of 100 solidi; (d) the Roman population, not yet placed on the same footing with the Francus (*possessores* with a wergeld of 100 solidi; *tributarii*, perhaps=*coloni*, with a wergeld of 62½ solidi); (e) slaves (*servi*), with a wergeld of 30 solidi; and a variety of other persons belonging to one or other of these classes (*puer crinitus*, class a; *porcedrius*, *faber ferrarius*, *aurifex*, &c., class e). An aristocracy is not mentioned. The people lived together in villages (chap. 45); they exercised agriculture and reared cattle (2-5, 27, &c.); they hunted and fished (6, 33); vineyards and gardens were known to them (27, 6, &c.); and gold work and iron work are mentioned (10). The chief of the state was a king; his officers included the *grafio*, who was chief of a *pagus* (shire); *saccharo*, chief of a hundred (both with a wergeld of 600 solidi; the latter could also be a *puer regis*, in which case he had a wergeld of 300 solidi); *thunginus* or *centenarius*, chief of a hundred, but probably elected by the people from among themselves, as his wergeld seems to have been the ordinary one. The judicial assembly was called *mallus*, the place where it assembled *malloberg*, the party in a suit *gamallus*, the councillor of the assembly *rachineburgus*, an officer who had to advise upon the sentence to be pronounced, and to value the property in question.

The famous clause in the Salic Law by which, it is commonly said, women are precluded from succession to the throne, and which alone has become known in course of time as the Salic Law, is the fifth paragraph of chapter 59 (with the rubric "De Alodis"), in which the succession to private property is regulated. The chapter opens with four (five) paragraphs in which it is enacted that—(1) if a man died without male issue, his mother (so in first recension; the second to fifth have "pater aut mater") would succeed to the inheritance (in hereditatem succedat); (2) failing her (the father and mother), his brother (brothers) or sister (sisters); (3) failing these, the sister of the mother; (4) when there was no sister of the mother, the sisters (sister) of the father; and (5), failing these, the nearest relative. After this the fifth paragraph reads as follows:—

First recension.	Second recension.	Third recension.	Fourth recension.	Fifth recension.
De terra vero nulla in muliere [portio aut] hereditas non pertinebit, sed ad virilem sexum qui fratres fuerint tota terra pertineat.	De terra vero Salica in muliere nulla pertinet portio, sed qui fratres fuerint, et ad virilem sexum tota terra pertineat.	De terra vero Salica nulla in muliere hereditas transeat porcio, sed ad virilem sexum tota terra ¹ proprietatis sue possideant.	De terra vero Salica nulla portio hereditatis mulieris veniat sed ad virilem sexum tota terra hereditas perveniat.	De terra vero Salica, in mulierem nulla portio hereditatis transit, sed hoc virilis sexus acquirit, hoc est, filii in ipsa hereditate succedunt. Sed ubi inter nepotes aut pro nepotes post longum tempus de alode terre contentio suscitatur, non per stirpes sed per capita dividantur.

¹ Text B reads: "propietas perveniat."

It seems clear that the first four paragraphs of the chapter, which admit women to a share in the inheritance, refer to *private, movable* property, and that, by the fifth paragraph, the inheritance of *land* was exclusively confined to males. We know that this exclusion of women from landed property was hardly a rule anywhere in the Frankish empire, and certainly not in the 6th century, but it obtained more or less afterwards, especially during the feudal period, when all the owners of landed property (*i.e.*, the tenants of fiefs) were liable to military service. We do not know when this exclusion of women from landed property began first to be applied and extended to an exclusion from the succession of thrones, as we do not read of such a notion until the middle of the 14th century during the controversy between Edward III. and Philip of Valois, when it was alleged to be derived from the Salic Law. It will be observed that the word *Salica* is not found in the oldest existing recension, but appears first in the second text, which some would ascribe to the end of the 6th century. Nor is the word found in the corresponding paragraph (56,4) of the *Lex Ripuaria*, which was based on the Salic Law. This addition (retained in all the other recensions, also in the so-called *Lex Emendata*) was no doubt made for some purpose, but we do not know whether it was made by a scribe, nor what particular notion it was intended to convey, nor whether it was this special word which gave rise to the idea of women being precluded from the succession of thrones.

The various texts of the *Lex Salica*, arranged in parallel columns, with a commentary on the Malberg glosses, were published in 1880, under the title *Lex Salica: the Ten Texts with the Glosses, and the Lex Emendata*, ed. J. H. Hessel, with notes on the Frankish words in the *Lex Salica* by H. Kern, 4to, London, 1880; comp. also Geo. Waitz, *Das alte Recht der salischen Franken*, 8vo, Kiel, 1846; Rud. Sohm, *Die fränk. Reichs- und Gerichts-Verfassung*, 8vo, Weimar, 1871; Pardessus, *Loi Salique*, 4to, Paris, 1843.

Having treated of the Salic Law somewhat minutely, we need only say a few words about each of the other *leges barbarorum*, as they all present somewhat similar features, and hardly differ except in the time of their compilation, the amount of fines, the number and nature of the crimes, the number, rank, duties, and titles of the officers, &c.

(2) The *Ripuarian Law*, or Law of the Riparian Franks (*Lex Ripuaria* or *Riboaria*, *L. Ripuariorum* or *Ribuvariorum*, *L. Ripuariensis* or *Ribuariensis*), or inhabitants of the river-banks, was in force among the East or Rhenish Franks in the Provincia Ribuarica, also called Ducatus or Pagus Ribuaricus (see vol. ix. p. 723), of which Cologne was the chief town. It has much in common with the Salic Law; in fact, chapters 32-64 are, with the exception of some necessary modifications and additions, merely a repetition of the corresponding chapters of the Salic Law, and even follow the same arrangement, so that this part of the code is hardly anything but the Salic Law revised by order of the kings of Austrasia. Professor Sohm (whose edition, published in 1883 in *Mon. Germ. Hist.*, Legg., vol. v. part 2, is based on nearly forty MSS., written between the 8th and the 11th century) divides the eighty-nine chapters of this code into four distinct portions, ascribing the first portion (chaps. 1-31), which contains enactments not met with in the Salic Law, to the first part of the 6th century, the second (chaps. 32-64) to the second part of the same century (*c.* 575), the third (chaps. 65-79) to the 7th century, and the fourth (chaps. 80-89) to the beginning of the 8th century. This result practically agrees with the statements found in a prologue in certain MSS. (which contain some of the barbarian codes), where it is said that the "Leges Francorum (= *Lex Ripuariorum*), Alamannorum, et Bajuvariorum" were compiled at Châlons-sur-Marne at the dictation of Thierry I. (511-534), by wise men learned in the law of his kingdom, and that the codes were afterwards revised and amended by Childebert I., Chlotar I., and Dagobert. Charlemagne promulgated some additional chapters to the Riparian Law in 803 (*Mon. Germ. Hist.*, Legg., i. 117). We may here observe that the Salic and Riparian Laws were to some extent introduced into England by the Norman Conquest, as appears from the Laws of Henry I., where we find enactments "secundum Legem Salicam" and "secundum Legem Ripuariam"; comp. Leg. Hen. I., capp. 87, §§ 9, 10, 11 (word for word = *L. Sal.*, tit. 43), 89, 90 § 4 (= *L. Rip.*, 70), and 83 § 5 (= *L. Sal.*, tit. 55 § 4).

(3) With the Riparian Law the *Lex Francorum Chamavorum* is intimately connected. The two MSS. in which it is preserved call it "Notitia vel commemoratio de illa ewa (law) quæ se ad Amorem habet." Amor is the district called Hamarlant, Hamalant, Hammelant, Hamuland, in the 9th century. This name was derived from the Chamavi, a German state mentioned by Tacitus (*Ann.*, xiii. 55; *Germ.*, c. 33, 34), which afterwards constituted a part of the Frankish empire. In the 9th century Hamalant was a part of the Pagus Ribuariorum. The whole code consists of only forty-eight short paragraphs, which are apparently nothing but statements made in answer to the "missi dominici" whom Charlemagne despatched to the various nations of his empire to inquire into their condition and to codify their respective laws. It may therefore be ascribed to the beginning of the 9th century (802 or 803). Professor Sohm has published it as an appendix to the *Lex Ripuaria* (*Mon. Germ. Hist.*, Legg., vol. v. part 2, p. 269).

(4) The *Lex Alamannorum* was (according to the prologue mentioned above) first compiled by the East-Frankish king Thierry (511-534), and afterwards improved and renewed by Childebert I. (511-558), Chlotar I. (558), and Dagobert I. (622-638). Although not much reliance can be placed on this statement, the researches of Professor Merkel, who edited the code from forty-eight MSS. (*Mon. Germ. Hist.*, Legg., vol. iii.), show that some kind of code called Pactus (of which he published three fragments) was compiled for the Alamanni in the reign of Chlotar I. (537-561). Under Chlotar II. (613-622) a more complete code, consisting of seventy-five chapters, was compiled, which was revised under Dagobert (628) and augmented with chapters 76-97; it was again altered and augmented under the Alamannic duke Landfrid (d. 730), whose work Merkel calls *Lex Alamannorum Landfridana*, and finally augmented in the Carolingian period (hence called *Lex Alamannorum Karolina sive reformata*), perhaps early in the 9th century. The code consists of 97 (in some MSS. 98, 99, 105, and 107) chapters.

(5) The *Lex Bajuvariorum*, or *Pactus Bavavorum*, had the same origin as the *Lex Alamannorum*, if we accept the somewhat unreliable statement of the prologue spoken of above. It seems probable that some kind of code was compiled for the Bavarians during the reigns of Clovis's sons. Those paragraphs which treat of ecclesiastical affairs and the position of the Bavarian dukes towards the Frankish kings (tit. ii. chap. xx. § 3) have clearly been inserted in Dagobert's time, if not later. There is a great similarity between certain provisions of the Bavarian and the Alamannic codes, and also some paragraphs of the former have been derived from the earliest recension of the *Lex Wisigothorum*. Some additions were made by Duke Thassilo II. (763-775), some by Charlemagne (803), some by King Louis (c. 906), and, finally, some by Duke Henry II. (end of 10th century). The emperor Henry III. is alleged to have granted the law of the Bavarians to the Hungarians in 1044. It consists of twenty-one chapters, each containing several paragraphs. Professor Merkel distinguishes three different recensions of the code and various additions, which he edited in 1863 from thirty-five MSS. for the *Mon. Germ. Hist.*, Legg., iii. p. 183 sq.

(6) For the *Lex Frisionum*, see vol. ix. p. 789.

(7) The *Lex Anglorum et Werinorum, hoc est, Thuringorum*, consists of seventeen chapters. Early editions of this code contained some legal decisions identical with those of Judge Wlemarus in the appendix to the *Lex Frisionum* (L. Angl. Jud. Wlem., 1, 2, 6, 7 = L. Fris., 22, §§ 54, 55, 86; Addit., i. 18), from which circumstance it was inferred that the compilation, or at least the revision, of both codes took place at one and the same time (802-803). But Riehthofen, who edited the work in *Mon. Germ. Hist.* (Legg., v. p. 103), and who rejects these legal decisions of Wlemarus as not belonging to this code at all, is of opinion (p. 115) that the code was not written even at the end of the 9th century. Opinions have differed also as to the region where the law originated. Some ascribe it to the Angli and Werini, who inhabited the Holstein and Schleswig regions; others attribute it to Thuringia proper; and in more recent times it has been ascribed to Thuringia on the left bank of the Rhine (=South Holland, Brabant, &c.). It was also argued that the code must have originated in a region where Frisian and Frankish elements had become mixed, both in language and in law, and where the Frankish preponderated. That the code originated in South Holland was inferred from its agreement in some respects with the *Lex Chamavorum*, which originated in the region of the lower Rhine and the Yssel. And the law may have come to be in force among the allied tribes on the Elbe in northern Thuringia, even though it originated in South Holland. If it originated in Thuringia, it must have been transplanted to the Holstein and Schleswig regions; and it was used by the Danes, as is clear from Canute bringing it over to England when he conquered the country in 1013.¹ But in England the code was simply called "Lex Werinorum, h.e., Thuringorum," but no longer "Anglorum," as the Danes called the whole Anglo-Saxon popula-

tion which they had conquered "Angli," and the law which they found in force "Lex Anglorum" (Legg. Edw. Conf., c. 30). Hence it has been concluded that what was called in England *Lex Danorum* is nothing but the *Lex Werinorum*. When the Normans conquered England in 1066 they soon recognized that this *Lex Danorum* and the Law of the Norwegians (*Lex Noricorum* or *Norwegensium*), who had migrated to England in earlier times, were practically one and the same. Hence William I., declaring that the population which he had brought over with him from Normandy were also originally Norwegians, resolved to abrogate the Anglo-Saxon laws and to leave only that of the Danes in force (Legg. Edw. Conf., c. 30),—a plan which only the most persevering entreaties of the Anglo-Saxon barons could induce him to abandon. The latest edition of this code (1875) is by K. F. von Riehthofen, who is decidedly against the South Holland origin of the law.

(8) The *Lex Saxonum* consists of nineteen chapters or sixty-six articles or paragraphs, and appears to be composed of three essential parts, the oldest of which (arts. 1-23) seems to have existed before the later additions known as the *Capitulare Paderbornense* (de partibus Saxonie) of 785 (or 777) and the *Capitulare Saxonium* of 797 (in which a "Lex Saxonum" and "Ewa Saxonum" are referred to; comp. chaps. 33 and 7, 8, 10); the second part (arts. 24-60) must have been compiled after that date; and the third (arts. 61-66) was probably added in 798, when Charlemagne had removed a part of the Saxon nobility as hostages from their own country; while the whole was united into one code at the diet of Aix-la-Chapelle in 802-803 (Merkel, *Lex Saxonum*, Berlin, 1853). The enactments of this code are far more severe than those of any other of the barbarian laws, and it often inflicts capital punishment for crimes which the other laws punish with mere pecuniary fines, as, for instance, theft and incendiarism. This rigour Charlemagne softened by reserving to himself the right of asylum and pardon, but it was expressly retained and granted anew by Conrad II. (1024-1039). The code was edited in 1875 by Von Riehthofen in *Mon. Germ. Hist.*, Legg., v. p. 1 sq.

(9) The *Leges Anglo-Saxonum* are for a great part written in Anglo-Saxon, and as such may be reckoned among the most ancient monuments of the Teutonic language. They appeared mostly in the form of constitutions promulgated by the various kings (some-what like the Frankish capitularies), with the co-operation of an assembly of leading men ("sapientes," Beda, *H. E.*, ii. 5), and frequently also of the clergy (*concilium*, *synodus*). They may be divided into two classes,—secular and ecclesiastical laws. Sometimes they are mere judicial sentences (*dōm*) or treaties of peace (*frīð*). The earliest laws we have are those of Æthelbert, king of Kent (c. 561); then follow those of Hloðhaer (c. 678) and Eadric (c. 685), Wihtraed (c. 691), Ine (after 688), Ælfred (after 871), Eadward (after 901), Æthelstan (after 924), Eadmund (after 941), Edgar (after 959), Æthelred II. (after 978), the Danish Canute (after 1017), William the Conqueror (after 1066). Then follow two collections of laws, the so-called "Leges Edwardi Confessoris" and "Leges Henrici I.," which, drawing from the Anglo-Saxon Law, represent the modifications which had been made in the earliest laws during the Norman period, and the introduction of new elements derived from the Salic and Riparian Laws. Besides these there are a good many canons and other ecclesiastical ordinances enacted under the archbishops Theodore and Egbert and King Edgar, &c.; comp. ENGLAND, vol. viii. pp. 285, 303. There is an edition of these laws by B. Thorpe (fol., London, 1840), another by Dr Reinh. Schmid (*Die Gesetze der Angel-Sachsen*, 2d ed., 8vo, Leipsic, 1858).

(10) The compilation of the *Lex Burgundionum* is usually ascribed to Gundobald (d. 516), whence it is also called *Lex Gundobada* (corrupted *Gombata*, Fr. *Loi Gombette*). It consists, according to its first prologue, of a collection of constitutions enacted partly by the earlier kings of Burgundy, partly by Gundobald, and revised by a general Burgundian diet. This agrees with the statements contained in its second prologue, which itself may be regarded as an independent constitution or edict to the counts and judges regarding the introduction of the law. In the rubric which it bears in the MSS. it is said that it was promulgated at Lyons on 29th March in the second year of Gundobald (some MSS. read Sigismund). As the year of Gundobald's accession is supposed to be 465, the promulgation must have taken place in 467, or, if we assume that the year is meant in which Gundobald became sole king of Burgundy (478), the date of the law would be 480, while it would be 517 if we adopt the reading "Sigismund" of some of the MSS. But as the law in its present state contains decrees both of Gundobald and of Sigismund we can only regard the whole as a compilation effected by the latter. In early editions the law was divided into eighty-nine chapters, with two additamenta, the first of which (consisting of twenty chapters) was ascribed to Sigismund, the second (of thirteen chapters) to his brother and successor, the last king of the Burgundians, Godomar. But Professor Bluhme (who published the law in 1863, in *Mon. Germ. Hist.*, Legg., iii. 497) places chap. i. (*De causis itineribus et aliis servitutibus*) and chap. xix. (*De liberali causa*) of the first additamentum as chaps.

¹ Comp. *Canuti Constit. de Foresta*, c. 33, "Emendat secundum pretium hominis medforis, quod secundum Legem Werinorum, i.e., Thuringorum [=L. Angl. and Werin., i. 2] est 200 solidorum."

xvii. and xlv. in "Papianus"; chap. xx. as chap. cvi. (extravagant) and its remaining chapters as chapters lxxxix. to cv. The second additamentum is placed as chap. cvii., the old chap. lxxxix. as chap. cviii., and a new chapter cix. (a decree of Sigismund "De collectis" of 516) added. It was Gundobald's intention that his law should decide all cases between Burgundians and between them and Romans; in all other cases the latter would only use Roman law (comp. second preface), of which the Lex Burgundionum contains many traces, and even the Burgundians were allowed to use Roman law (comp. L. Burg., tit. 43, 60, 55 § 2). The Latinity of the Burgundian Law is purer than that of all the preceding barbarian codes, and we find in it a distinct tendency to treat Romans with greater leniency and to make them equal to the Burgundians in the eye of the law. Through Gundobald's political relations with Alaric II., the Lex Burgundionum influenced the West-Gothic legislation, of which traces are found in the Lex Wisigothorum and the interpretatio to Alaric's Breviarium. Charlemagne promulgated in 813 a Capitulare Aquisgranum (*Lion., Legg.*, i. 817) regarding the Lex Burgundionum, though the text was not altered. Agobart, bishop of Lyons, complained to Louis the Pious respecting certain abuses caused by the Burgundian Law (*Bouquet*, vi. 356), but no remedy was effected. On the other hand, towards the end of the 9th century the law had gradually fallen into disuse like all the other barbarian laws, though it is said that the emperor Conrad II. revived and confirmed it. See, besides Professor Bluhme's edition, Hubé, *Hist. de la formation de la loi Bourguignonne*, Paris, 1867.

(10a) In the second preface to the Lex Burgundionum (published in 502) the Roman subjects of the Burgundian king were promised a codification of their own laws. This work appears to have been promptly executed and was published under the title *Lex Romana Burgundionum*, perhaps before the compilation of the Breviarium Alarici (506). This collection is also known as *Papianus*, of which name (found already in MSS. of the 9th century) no satisfactory explanation has hitherto been offered, some, perhaps wrongly, supposing that it is a corruption of the name of Papinianus, the Roman jurist. It was published by Professor Bluhme as an appendix to the Lex Burgundionum (*Mon. Germ. Hist., Legg.*, iii. p. 579).

(11) As regards the *Lex Wisigothorum* (also called *Forum Judicum*, *Judicum Liber*, *Forum Judiciale*, &c.), we know with certainty from Isidore of Seville (*Hist. Goth. Hisp.*, 504) that Euric (466-483) was the first Gothic king who gave written laws to the West Goths. It would therefore be erroneous to ascribe (with Mariana, *Hist. de España*, v. 6) their first written laws to Euric's son, Alaric II., though it seems probable that the latter, by adding his own laws to those of his father, was really the first author of a West-Gothic codification. Isidore refers to the collection of laws (as it had been preserved up to the end of the 5th and the beginning of the 6th century) as the Laws of Euric, though we must assume that the statutes of the kings who succeeded Euric had already been added to his collection. Isidore also tells us (*Hist. Goth. Hisp.*, 606-624) that Leovigild (d. 586) revised Euric's Laws. As Isidore was bishop of Seville from 599 to 636, and may therefore be said to have been a contemporary of Leovigild, his testimony may be accepted as conclusive, though a much later but untrustworthy tradition would have it that the revision was executed by Leovigild's son, Reccared I. (the first Catholic king of the Goths), who died in 601, whereby the whole population of Spain was equalized in point of law. According to Spanish traditions of the 12th century, the West-Gothic collection of laws was again revised, under Sisenand, by the fourth council of Toledo (633), a revision on which Isidore seems to have exercised some influence. It is uncertain, however, whether the code was then systematically arranged and divided into twelve books, as we now have it, or whether this was done under Chindaswinth (d. 652) or under his son Receswinth (d. 672). The several books of the code are divided (in imitation of the codes of Theodosius and Justinianus) into tituli, and those again into chapters or constitutions. From Leovigild down to Egica (d. 701) and his son and coregent Witiza (d. c. 701, the last king of the Goths before the invasion of the Moors) every constitution bears the name of the king who promulgated it, while those dating from before Leovigild have the word "antiqua" prefixed to them instead of the name of a king. This designation is said to have been commenced by Erwig (680-687), who thereby wished to prevent the clergy from claiming the code as their work. Of the texts which existed before the fourth council of Toledo only one small fragment has come down to us, in a palimpsest preserved in the Paris National Library (No. 1278). Some regard this as the remainder of the supposed recension of Reccared I.; others regard it as a fragment of the Laws of Euric, though it could in no case be the Laws of Euric themselves, but at most their codification by Alaric II. The fragment was known to the Benedictines (*Nouv. Traité de Diplom.*, i. 483, iii. 52, 152, note 1), and was published in 1847 by Professor Bluhme (*Die Westgoth. Antiqua oder das Gesetzbuch Reccared's I.*, Halle). The text is undoubtedly older than those enactments which we find designated as "antiqua," so that it could hardly be placed later than the commencement of the

6th century, i.e., shortly after the compilation of the Breviarium Alarici (506). Hence the text called "antiqua" may be regarded as a modification of that of the Paris palimpsest, and was probably not made before the end of the 6th or the beginning of the 7th century. Roman law, which is so conspicuous in the later text, may already be traced in that of the palimpsest (taken from the Breviarium Alarici), and also in the "antiqua" constitutions, in which we find even traces of Justinian's law. The Lex Wisigothorum (the first code in which Roman law and Teutonic law were systematically combined) was no doubt regarded, after Leovigild and Reccared I., as a code for the Goths as well as for the Romans, without abolishing the Breviarium among the Romans. But King Chindaswinth ordained that the Lex Wisigothorum should be the sole code for both nations, prohibiting at the same time the use of the Roman law, thereby materially promoting the amalgamation of the two nations. It remained in force in Spain throughout the Middle Ages, and was translated into Spanish (Castilian) under Ferdinand III. (1229-1234, or 1241) under the title *Fuero Juzgo*, or *Fuero de Cordova*.

Editions: (1) *Fuero Juzgo en Latin e Castellano cotejado con los mas antiguos y preciosos Códices por la Real Academia Española*, Madrid, 1815, fol.; (2) in *Portugalia Monumenta Historica*, vol. i., Lisbon, 1850, fol.

(11a) Here also we may mention a *Lex Romana* compiled for the Roman population, just as in Burgundy. It is also known as *Liber Legum*, *Liber Legum Romanorum*, and as *Lex Theodosii* or *Corpus Theodosianum*. It received the latter name because the *Codex Theodosianus* served as its basis. It includes also excerpts from *novellæ* of Theodosius, Valentinian, Marcian, Majorian, Severus, and from the *Institutiones* of Gaius, the *Sententiæ* of Paulus, the *Codices Gregorianus* and *Hermogenianus*, &c. In a MS. of the 10th century it is called *Breviarium*, and the title *Breviarium Alarici* or *Alaricianum* has become general since the 16th century. The compilers of the Breviarium are not known, but it was published in the twenty-second year of Alaric II., i.e., on 5th February 506, at Aire (Aures) in Gascony. It was also used in other western provinces of the Roman empire, and was imitated, excerpted, and altered in other places. One recension, probably dating from the 9th century, is known (from the place where the MS. was found) as the *Lex Romana Utinensis*. The best edition is that of G. Haenel, *Lex Romana Wisigothorum*, Berlin, 1847.

(11b) We have also a code for the Eastern Goths compiled by command of Theodoric after 506, but before 526, and known as *Edictum Theodorici*. It consists of 155 chapters (with a few additions), which are in reality an epitome of Roman law. It was published in 1875, in *Mon. Germ. Hist.*, Legg., v. p. 145 sq., ed. by Professor Bluhme.

(12) *Leges Langobardorum*.—The first trace of Lombardic law is an edict of Rothar, consisting of 388 chapters, and promulgated at a diet held at Pavia on 22d November 643. This was followed by laws of Grimoald (668), nine chapters; Liutprand (713-735), six books; Ratchis (746), nine chapters; Aistulfus (c. 755), fourteen chapters. Additions were also made by Charlemagne and his successors down to Lothair II. In the manuscripts the texts are arranged, some in a chronological, some in a systematical order. The latter arrangement is already found in a MS. of the 9th century. The systematic collection, which was used chiefly in Bologna at lectures and for quotations and was known as *Lombarda* (*Liber Langobardæ s. Lombardæ*), appears to have been made in the 11th century. The text as it exists at present is very corrupt, as a number of glosses (some of great antiquity) and formulæ, added in the first instance by those who had to use the code to explain certain enactments of the law, afterwards found their way into the text. Towards the end of the 12th and down to the beginning of the 16th century various glosses and commentaries on the Lombardæ made their appearance. The first commentaries were those of Aripbrand and of Albertus (second half of 12th century). The later commentators (Carolus de Tocco, c. 1200; Andreas of Barulo, c. 1280; Blasius de Morcone of Naples, before 1338; Boherius and Johannes Nenna of Bari, c. 1540) refer frequently to Roman law. Of the Edictum Rotharis a Greek translation was made, of which only fragments have been preserved (comp. C. E. Zachariæ, *Fragmenta versionis Græcæ Legum Rotharis, Langob. regis*, ex. cod. Paris. Græc., No. 1348, Heidelberg, 1835).

Editions: (1) C. Baudouin a Vesme, *Edicta regum Langobardorum*, Turin, 1855, reprinted by J. F. Neugebauer, Munich, 1855, 1856; (2) *Mon. Germ. Hist., Legg.*, iv. (1888), by Fr. Bluhme and Alfr. Boretius; (3) Fr. Bluhme, *Edictus ceterisque Langobardorum leges*, Hanover, 1870; comp. Merkel, *Geschichte des Lombardenrechts*, Berlin, 1850.

(13) The *Leges Walliæ* do not belong to the Teutonic family of codes; but it is not out of place to mention them here. There is, comparatively speaking, no great distance of time between the *leges barbarorum* and the Laws of Wales, while the contents of the latter show a similar, nay almost the same, idea of law as the former; and, apart from the fact that Wales became permanently connected at the end of the 13th century with a Teutonic people, the Anglo-Saxons, it has been noticed that in Wales Roman and Germanic, but no traces of a specific Welsh law are found. King Howell Dda (i.e., the Good), who died in 948, is the originator of

the Welsh code.¹ In the preface it is stated that Howel, "seeing the laws and customs of the country violated with impunity, summoned the archbishop of Menevia, other bishops and the chief of the clergy, the nobles of Wales, and six persons (four laymen and two clerks) from each comot, to meet at a place called Y Ty Gwyn ar Dav, or the white house on the river Taw, repaired thither in person, selected from the whole assembly twelve of the most experienced persons, added to their number a clerk or doctor of laws, named Bllgywryd, and to these thirteen confided the task of examining, retaining, expounding, and abrogating. Their compilation was, when completed, read to the assembly, and, after having been confirmed, proclaimed." Howel caused three copies of them to be written, one of which was to accompany the court for daily use, another was deposited in the court at Aberfraw, and a third at Dinewr. The bishops denounced sentence of excommunication against all transgressors, and soon after Howel himself went to Rome attended by the archbishop of St David's, the bishops of Bangor and St Asaph, and thirteen other personages. The laws were recited before the pope and confirmed by his authority, upon which Howel and his companions returned home." All this could not have been effected before Howel had subjected Wales to his own rule, therefore not before 943. We have three different recensions of the code, one for Venedotia or North Wales, another for Dimetia or South Wales, a third for Gwent or North-East Wales. We do not know how far these recensions were uniform in the beginning; but a variance must have occurred shortly after, for the manuscripts in which the codes are preserved differ greatly from each other. The code was originally compiled in Welsh, but we have no older MSS. than the 12th century, and even the earliest ones (especially those of the Venedotia recension) contain many interpolations. The Latin translations of the code would seem to be very old, though even here we have no earlier MSS. (belonging to the Dimetia recension) than the 13th century. The Latin text is much shorter than the Welsh, but we do not know whether this abridgment was made on purpose, or whether the translation is an imitation of an earlier text. The texts present only a few traces of Roman law, which, however, are evidently additions of a later period. The whole body of Welsh laws was published in one volume by An. Owen under the direction of the commissioners on the public records (fol., London, 1841).

For further information on the barbarian codes, see Heinr. Zoepf, *Deutsche Rechtsgeschichte*, 8vo, Brunswick, 1860, vol. i. p. 8 sq., whose clear and able treatment of the subject has been taken as the basis of paragraphs 4-13 above; comp. also Stobbe, *Geschichte der deutschen Rechtsquellen*, 8vo, Brunswick, 1860. (J. H. H.)

SALICYLIC ACID, an organic acid found in nature, in the free state, in the flowers of the meadow-sweet (*Spiræa Ulmaria*, L.) and, combined with methylic ether, in the leaves of the wintergreen (*Gaultheria procumbens*, L.) and *Andromeda Leschenaultii*, in the bark of the sweet birch (*Betula lenta*, L.), and in several species of *Viola*. It was discovered in 1838 by Piria, who prepared it artificially by the decomposition of SALICIN (*q.v.*). It is remarkable as being the first organic compound occurring in nature which has been prepared artificially on the large scale as a commercial article. During the last few years it has been extensively used in medicine as a remedy for acute rheumatism, either alone or in the form of its sodium salt. Possessing powerful antiseptic properties and being poisonous only in large doses (the medicinal dose being from 5 to 30 grains), it is capable of manifold uses in the arts and manufactures. In the proportion of from 1 to 10 per cent. it prevents the development of bacteria in fluids containing them, and if added to the extent of 1 part in 60 it will destroy their life. It also kills *Torula*, and prevents the souring of beer and milk. It hinders the chemical changes brought about by the action of vegetable ferments or enzymes such as amygdalin and sinnigrin, and consequently can prevent the formation of essential oil of almonds or of oil of mustard, &c. Plants watered with its solution speedily die. The addition of a little of the acid to glue renders it more tenacious; skins to be used for making leather do not undergo decomposition if steeped in a dilute

solution; butter containing a small quantity of it may be kept sweet for months even in the hottest weather. It also prevents the mouldiness of preserved fruits and has been found useful in the manufacture of vinegar. Unless the perfectly pure acid be employed the addition of salicylic acid to articles of food must be considered dangerous, some persons being peculiarly susceptible to its action.

Salicylic acid is met with in commerce in two forms, "natural" and "artificial." The former occurs as handsome prismatic crystals resembling those of strychnin, but considerably larger, usually about half an inch in length; the latter is met with as light minute crystals bearing some resemblance to sulphate of quinine, but smaller. The natural acid is prepared by decomposing the volatile oil of wintergreen or of the sweet birch by a strong solution of potassium hydrate, and treating the resulting potassium salicylate with hydrochloric acid, which liberates the salicylic acid. The artificial acid is prepared according to Robbe's patent process by passing carbonic anhydride through sodium phenoxide (carbolate) heated in a retort, with certain precautions respecting temperature to prevent the formation of para-hydroxybenzoic acid. It is subsequently purified and recrystallized. An improvement has recently been made on this process by substituting sodium phenol for sodium phenoxide, the whole of the phenol being in this case converted into salicylic acid. Formerly this acid was met with in commerce contaminated with phenol, rosolic, and para-oxybenzoic acids, but is now prepared in a perfectly pure condition. The presence of the first-named impurity may be detected by its odour and by the melting-point being lower than when pure, the second by the pink tinge it communicates to the acid, and the third by its comparative insolubility in boiling chloroform, by the greater solubility of its calcium salt, and by its giving a yellow precipitate with ferric chloride. Salicylic acid when pure should be free from odour and should dissolve completely in alcohol, and its solution, when spontaneously evaporated without contact with air, should yield crystals having colourless points. It has a specific gravity of 1.45 and fuses at 155° C. (311° Fahr.); above that temperature it is converted into phenol and carbonic anhydride. Its chemical formula is $C_6H_4(OH)CO_2H$. It is soluble in 760 parts of cold water, in 4 of rectified spirits of wine, and in 200 of glycerin, also in olive and castor oils, in melted fats and vaseline. Alkaline salts of citric, acetic, and phosphoric acids render it more soluble in water, possibly from the base combining with it. An aqueous solution of salicylic acid gives a deep violet colour with ferric salts. The methyl, ethyl, and amyl ethers of the acid are used in perfumery, and the calcium salt if kept for some time and then distilled with water yields a liquid which has a strong odour of roses (Dingler, *Polytechn. Journ.*, ccxvii. p. 136).

When administered internally salicylic acid rapidly lowers the bodily temperature and reduces the pulse rate, blood pressure, and rapidity of respiration, causing death when given in excessive doses by paralysis of the respiratory organs. It is excreted in the urine partly as salicylic and partly as salicyluric acid, communicating to it a brown colour by reflected and a green one by transmitted light. When taken for some time it produces deafness, giddiness, headache, and noises in the ears, like quinine. Taken internally in medicinal doses it possesses the same properties as salicin and sodium salicylate (see below), but is much less used in medicine. Applied externally, it has a marked action on thickened epidermis, and is hence used for the cure of corns and warts, to relieve pain and destroy fœtor in ulcerated cancer, and also in certain skin diseases in which an antiseptic is useful, as in psoriasis, eczema, intertrigo, lupus, and ringworm. Taken as snuff it relieves hay fever.

Salicylate of sodium ($NaC_7H_5O_3$) is more frequently used in medicine than salicylic acid because less irritating to the mucous membranes. It is prepared by neutralizing a solution of sodium carbonate with salicylic acid. It occurs in commerce as small white crystalline plates with a slight pearly lustre, having a sweetish saline taste and mildly alkaline reaction. It is soluble in 1.5 parts of water and 6 of alcohol at 15° C. (59° Fahr.), but much more so in boiling water and alcohol. It is chiefly employed medicinally as a remedy for acute rheumatism, in which it lowers the temperature and allays pain. It is also useful in headache and in phlegmasia alba; its cholagogic action and its power of rendering the bile more fluid indicate its usefulness in the treatment of gall stones. It has been found of service in Menière's disease. Alcohol or other stimulants are often given with it to prevent the depressing influence on the heart's action which is caused by large doses. Ammonia is, however, unfit for this purpose (Martindale, *Extra Pharmacopœia*, 3d ed., p. 57). Like salicylic acid, it produces when given in full doses subjective auditory phenomena, but these symptoms are relieved by the use of ergot and hydrobromic acid. In a few persons it causes most disagreeable visions whenever the eyes are shut, and in others it has even produced delirium. In its action on bacteria it is about one-third less powerful than salicylic acid.

¹ There is no historical foundation for the legendary laws of a prince Dymal (or Dyvnwal) Moel Mud, nor for the Laws of Marsia, which are said to belong to a period before the Roman invasion, even so early as 400 years before Christ. An English translation by the side of the Welsh text of the so-called triads of Dyvnwal Moel Mud is given by Owen, *The Ancient Laws of Wales*, London, 1841, p. 630.

SALIERI, ANTONIO (1750–1825), dramatic composer, was born at Legnano, Italy, August 19, 1750. In 1766 he was taken to Vienna by a former "Kapellmeister" named Gassmann, who introduced him to the emperor Joseph, and fairly prepared the way for his subsequent success. His first opera, *Le Donne Letterate*, was produced at the Burg-Theater in 1770. On Gassmann's death in 1774, he received the appointment of Kapellmeister and composer to the court; and on the death of Bonno in 1788 he was advanced to the dignity of "Hofkapellmeister." He held his offices with honour for fifty years, though he made frequent visits to Italy and Paris, and composed for many important European theatres. His *chef d'œuvre* was *Tarare* (afterwards called *Asur, Re d'Ormus*), a work which was preferred by the public of Vienna to Mozart's *Don Giovanni*, though it is, in reality, quite unworthy of comparison with that marvellous inspiration. It was first produced at Vienna, June 8, 1787, and strangely enough, considering the poverty of its style, it was revived at Leipsic in 1846, though only for a single representation. His last opera was *Die Neger*, produced in 1804. After this he devoted himself to the composition of church music, for which he had a very decided talent. Salieri lived on friendly terms with Haydn, but was a bitter enemy to Mozart, whose death he was suspected of having produced by poison; but no particle of evidence was ever forthcoming to give colour to the odious accusation. He retired from office, on his full salary, in 1824, and died at Vienna May 7, 1825. None of Salieri's works have survived the change of fashion. He gave lessons in composition both to Cherubini and Beethoven; the latter dedicated to him his Three Sonatas for Piano-forte and Violin, *Op.* 12.

SALII. See **MARS**.

SALISBURY, or NEW SARUM, a city and municipal and parliamentary borough, the county town of Wiltshire, England, is situated in a valley at the confluence of the Upper Avon, the Wily, the Bourne, and the Nadder, on the Great Western and South Western Railways, 80 miles west-south-west of London. The city at the beginning was regularly laid out by Bishop Poore and still retains substantially its original plan. In the centre is the market-place, a large and handsome square, from which the streets branch off at right angles, forming a series of quadrangles facing a thoroughfare on each side, and enclosing in the interior a space for courts and gardens. The streams flowed uncovered through the streets till the visitation of cholera in 1849 led to their being arched over. The cathedral of St Mary was originally founded on the hill fortress of Old Sarum by Bishop Herman, when he removed the see from Sherborne between 1075 and 1078. The severe drought in 1834 caused the old foundations to be discovered. Its total length was 270 feet; the nave was 150 feet by 72, the transept 150 feet by 70; and the choir was 60 feet in length. In 1218 Bishop Poore procured a papal bull for the removal of the cathedral to New Sarum. For this various reasons have been given,—the despotism of the governor, the exposure to high winds which drowned the voice of the officiating priest, the narrow space for houses, and the difficulty of procuring water. Until the Reformation service still continued to be performed in the old church. A wooden chapel of St Mary was commenced at New Sarum in the Easter-tide of 1219, and the foundations of the new cathedral were laid by Bishop Poore, 28th April 1220. It was dedicated at Michaelmas 1258, the whole cost having amounted to 40,000 marks, or £26,666. The cloisters, of great beauty, and the late Early English chapter-house were added by Bishop Walter de la Wyle (1263–74). The tower from near the ridge was built in the Decorated style by Bishop Wyville about 1331,

and the spire was added between 1335 and 1375. It is the highest in England (404 feet), and is remarkable both for its beauty of proportion and the impression it conveys of lightness and slenderness. The chapel built by Bishop Beauchamp (1450–82), that built by Lord Hungerford in 1476, and the fine campanile were all ruthlessly demolished by the architect James Wyatt, 1782–1791. The cathedral as a whole is a unique specimen of Early English, having the advantage of being practically completed as it now stands within a remarkably short period. For lightness, simplicity, grace, and unity of design it is not surpassed in England. It is in the form of a Greek or double cross, and comprises a nave of ten bays with aisles and a lofty northern porch; two transepts, one of three and the other of two bays, while both have eastern aisles for chapels; a choir of three bays with aisles; a presbytery of three bays with aisles; and a lady-chapel of two bays. The total length of the building is 449 feet, the length of the nave being 229 feet 6 inches, of the choir 151 feet, and of the lady-chapel 68 feet 6 inches, while the principal transept has a length of 203 feet 10 inches, and the eastern transept of 143 feet. The width of the nave is 34 feet 4 inches, and of the principal transept 50 feet 4 inches. The library, built by Bishop Jewel (1560–71), contains about 5000 volumes and several MSS. of great interest. In the close, occupying an area of half a square mile, and possessing a finely-shaded mall, are the episcopal palace, an irregular structure begun by Bishop Poore but of various dates, the deanery house, and other buildings. The three parish churches are St Martin's, with square tower and spire, and possessing a Norman font and portions of Early English in the choir; St Thomas's (of Canterbury), founded in 1240 as a chapel to the cathedral, and rebuilt in the 15th century, a handsome building in the Perpendicular style; and St Edmund's, founded as the collegiate church of secular canons in 1268, but subsequently rebuilt in the Perpendicular style and lately restored at a cost of £6000. The residence of the college of secular priests is now occupied by the modern ecclesiastical college of St Edmund's, founded in 1873. St John's chapel, founded by Bishop Bingham (1228–46), is now occupied by a dwelling-house. There is a beautiful chapel attached to the St Nicholas hospital, founded in the reign of Richard II. The poultry cross, or high cross, an open hexagon with six arches and a central pillar, was erected by Lord Montacute before 1335. In the market-place is Marochetti's statue to Lord Herbert of Lea. The principal secular buildings are the court-house, the market-house, the Hamilton Hall, the county jail, and the theatre. Among the specimens of ancient domestic architecture still remaining may be mentioned the banqueting hall of J. Halle, wool merchant, built in 1470, and Audley House, belonging also to the 15th century, and repaired in 1881 as a diocesan church house. There are a large number of educational and other charities, including the bishop's grammar school, Queen Elizabeth's grammar school, Talman's girls' school, the St Nicholas hospital, founded in the reign of Richard II., and Trinity hospital, founded by Agnes Bottenham in 1379. At one time the city possessed woollen and cutlery manufactures, but these have now declined; and, although the manufacture of hardware and of boots and shoes is still carried on, it is on its shops for the supply of the neighbouring villages and its agricultural trade that it now principally depends. The population of the city and municipal borough (area 616 acres) in 1871 was 12,903, and that of the parliamentary borough (area 676 acres) 13,839; in 1881 the numbers were 14,792 and 15,680.

Salisbury and its neighbourhood are remarkably rich in relics of antiquity. To say nothing of Old Sarum and the scanty ruins of

the royal palace of Clarendon, Milford Hill and Fisherton are two of the richest fields in the country for palæolithic implements. In the Blackmore Museum Salisbury possesses one of the finest collections of prehistoric antiquities in England; its splendid gathering of objects from the mounds in the New World is probably unsurpassed. The fortress of Old Sarum (*Searobyrig*, i.e., Sear-borough, probably "the dry city"; *Sarisberic* in Domesday) is of very early date, and was undoubtedly held by the Belgæ before it became an important fortress of the Romans (*Sorbidunum*). It occupied a conical mound rising abruptly from the valley, and its fosse and ramparts, which still remain, are about a mile in circumference. Various Roman roads branched out from it in different directions. Near it Cynric won a great victory over the Britons in 552. It was burned and sacked by Swend in 1003. In the great plain beneath William the Conqueror in 1070 reviewed his army after his victories; and it was here that he took the oath of fealty from all English landholders on the completion of Domesday in 1086. Old Sarum continued to have the privilege of returning two members to parliament until 1832, although latterly not a single house remained within its limits. New Sarum grew up round the new cathedral founded in the 13th century. In 1227 it received from Henry III. a charter conferring on it the same freedom and liberties as Winchester. The duke of Buckingham was executed at Salisbury in 1484. During the Civil War it was held alternately by both parties. Salisbury first sent members to parliament in 1295, and various parliaments have been held there. The Redistribution Act of 1885 deprived it of one of its two representatives.

SALLUST (86–34 B.C.). Sallust is the generally accepted modern form of the name of the Roman historian Caius Sallustius Crispus. 86 B.C. was the year of his birth, and the old Sabine town of Amiternum at the foot of the Apennines was his birthplace. He came of a good plebeian family, and entered public life at a comparatively early age, obtaining first the quaestorship, and then being elected tribune of the people in 52 B.C., that year of political turbulence in which Clodius was killed by Milo. Sallust was opposed to Milo and to Pompey's party and to the old aristocracy of Rome. From the first he was a decided partisan of Cæsar's, and to Cæsar he owed such political advancement as he attained. Unless he was the victim of violent party misrepresentation, he seems to have been morally worthless. In 50 B.C. the censors exercised their power of removing him from the senate on the ground of gross immorality. A few years afterwards, however, no doubt through Cæsar's influence, he was restored to his position, and in 46, in which year Cæsar was for the third time consul, he was prætor, and was with Cæsar in his African campaign, which ended in the decisive victory of Thapsus over the remains of the Pompeian party and in the suicide of Cato. Sallust remained for a time in Africa as governor of the province of Numidia, which, it would seem, Cæsar gave him as a reward for good service. It was said that he enriched himself at the expense of the provincials, but the charge, as far as we know, was never substantiated, though it was rendered highly probable by the fact that he returned to Rome the following year a very rich man, able to purchase and lay out in great splendour those famous gardens on the Quirinal known as the "horti Sallustiani," which became subsequently an imperial residence. He now retired from public life and devoted his leisure to letters, for which he had always had a taste, and certainly considerable ability. The fruits of his industry have come down to us in the shape of a history of the famous Catiline conspiracy, of an account of the war with Jugurtha, and of some fragments of a larger work—"histories," as the Romans called them, "memoirs," as we should style them. His history of the Catiline conspiracy

was his first published work; it is the history of the memorable year 63, when Cicero as consul baffled and confounded Catiline by making all men believe that he was an arch-conspirator against the liberties of his country, who, under specious pretexts of relieving poverty and distress, was really aiming at making himself a tyrant and a despot. Sallust adopts the view which was no doubt the usually accepted one, and he writes accordingly as a political partisan, without giving us a clear insight into the causes and circumstances which gave Catiline a considerable following, and led many to think that his schemes were more respectable than those of a mere wild revolutionist. He does not explain to us at all adequately what Catiline's plans and views were, but simply paints the man as the deliberate foe of all law, order, and morality. Catiline, it must be remembered, had been of Sulla's party, to which Sallust was opposed. There may be truth in Mommsen's suggestion that he was particularly anxious to clear his patron Cæsar of all complicity in the conspiracy. Anyhow, the subject was quite one to his taste, as it gave him the opportunity of showing off his rhetoric at the expense of the old Roman aristocracy, whose degeneracy he delighted to paint in the blackest colours. His history, again, of the war with Jugurtha, though a valuable and interesting monograph, is not a satisfactory performance. We may assume that he had collected materials and put together notes for it during his governorship of Numidia. Here too we find him dwelling on the feebleness of the senate and of the aristocracy, and dropping too often into a tiresome moralizing and philosophizing vein, his besetting weakness, but altogether failing us in those really important details of geography and even chronology which we naturally look for in the historians of military operations and campaigns. In all this Sallust is no better than Livy. Of his *Histories*, said to have been in five books, and to have commenced with the year 78 B.C. (the year of Sulla's death), and to have concluded with the year 66, we have but fragments, which are, however, enough to show the political partisan, who took a keen pleasure in describing the reaction which followed on the dictator's death against his policy and legislation. It is unfortunate that the work has not come down to us entire, as it must have thrown much light on a very eventful period, embracing the war against Sertorius, the campaigns of Lucullus against Mithradates of Pontus, and the victories of the great Pompey in the East. A few fragments of his works were published for the first time from a manuscript in the Vatican early in the present century. We have also two letters (*Duae epistolæ de Republica ordinanda*) addressed to Cæsar, letters of political counsel and advice, which have been commonly attributed to Sallust, but as to the authenticity of which we must suspend our judgment.

The verdict of antiquity was on the whole favourable to Sallust as an historian and as a man of letters. In certain quarters he was decried; his brevity was said to be obscurity, and his fondness for old words and phrases, in which he is said to have imitated his contemporary Cato, was ridiculed as an affectation. Tacitus, however, speaks highly of him (*Ann.*, iii. 30); and, to do him justice, we must remember that he struck out for himself almost a new line in literature, as up to his time nothing of much value had been done for Roman history, and his predecessors had been little better than chroniclers and annalists of the "dry-as-dust" type. Sallust aimed at being something like a Roman Thucydides, and, though he falls far short of the great Greek historian, and drifts now and again into mere rhetoric and pedantry, we may at least congratulate ourselves on the possession of his *Catiline* and *Jugurtha*, and we must feel that fortune has been unkind in depriving us of his larger work, his *Histories*.

SALMASIUS, CLAUDIUS (1588–1653), in the vernacular **SAUMAISE**, the most distinguished classical scholar of his day, was born at Semur-en-Auxois in Burgundy, April 15, 1588. His father, a counsellor of the parlement of Dijon, gave him an excellent education, and sent

him at the age of sixteen to Paris, where his promise excited the especial interest of Casaubon. After hardly overcoming his father's opposition, he proceeded in 1606 to the university of Heidelberg, nominally to be initiated into jurisprudence under Godefroy, but in fact entirely devoted to classical studies. The atmosphere of the place probably had its influence in inducing him to embrace Protestantism, the religion of his mother; and his first publication was an edition of a work by Nilus Cabasilas, archbishop of Thessalonica, against the primacy of the pope, with a similar tract by Barlaam. The Latin translation of these works, although apparently assigned to Salmasius on the title page, is not by him. In 1609 he edited Florus, with notes compiled in ten days. In the following year he returned to France, and nominally pursued the study of jurisprudence to qualify himself for the succession to his father's post, which he eventually lost on account of his religion. Nothing important proceeded from his pen until 1620, when he published Casaubon's notes on the *Augustan History*, with copious additions of his own, equally remarkable for learning and acumen. In 1623 he married Anna Mercier, a Protestant lady of a distinguished family; and in 1629 he produced his *magnum opus* as a critic, his commentary on Solinus's *Polyhistor*, or rather on Pliny, to whom Solinus is indebted for most of his materials. Greatly as this work may have been overrated by his contemporaries, it is still a monument of stupendous learning and conscientious industry. Salmasius learned Arabic to qualify himself for the botanical part of his task, and was so unwilling to go to press without having consulted a rare treatise by Didymus that the third part of his commentary, *De Herbis et Plantis*, did not appear in his lifetime. He was now ostensibly as well as actually devoted to philology, and foreign universities vied with each other in endeavouring to secure his services. After declining overtures from Oxford, Padua, and Bologna, he closed in 1631 with a proposal from Leyden, offering an entirely honorary professorship, with a stipend of two thousand (afterwards raised to three thousand) livres a year, merely to live in Holland and refute the *Annals* of Baronius. This latter stipulation he never fulfilled. Shortly after his removal to Holland, he composed, at the request of Prince Frederick of Nassau, his treatise on the military system of the Romans, which was not published until 1657. Other works followed, mostly philological, but including a denunciation of wigs and hair-powder, and a vindication of moderate and lawful interest for money, which drew down upon him many expostulations from lawyers and theologians. It prevailed, however, with the Dutch Church to admit money-lenders to the sacrament. His treatise *De Primatu Papæ* (1645), accompanying a republication of the tract of Nilus Cabasilas, excited a warm controversy in France, but the Government declined to suppress it. Notwithstanding his Protestantism and the opposition of the papal nuncio, he had already been made a royal counsellor and a knight of St Michael, and great offers had been made to induce him to return, which, suspecting that he was to be charged with the composition of a panegyric on Richelieu, he honourably declined.

In November 1649 appeared the work by which Salmasius is best remembered, his *Defensio Regia pro Carolo I.* His advice had already been sought on English and Scotch affairs, and, inclining to Presbyterianism or a modified Episcopacy, he had written against the Independents. It does not appear by whose influence he was induced to undertake the *Defensio Regia*, but Charles II., low as his exchequer was, defrayed the expense of printing, and presented the author with £100. The first edition was anonymous, but the author was universally known. A French translation which speedily appeared under the

name of Le Gros was the work of Salmasius himself. This celebrated work, in our day principally famous for the reply it provoked from Milton, even in its own added little to the reputation of the author. Salmasius injured his character for consistency by defending absolute monarchy, and knew too little of English history and politics to argue his cause with effect. He deals chiefly in generalities, and most inappropriate illustrations from Biblical and classical history. Not caring sufficiently for his theme to rise to the heights of moral indignation, he is as inferior to Milton in earnestness as in eloquence and the power of invective. Milton had, no doubt, a great advantage in encountering a personality, at whose head vituperation could be launched, while Salmasius is fighting abstractions and indicting a people. But the reply to Milton, which he left unfinished at his death, and which was published by his son in 1660, is insipid as well as abusive. Until the appearance of Milton's rejoinder in March 1651 the effect of Salmasius's work was no doubt considerable; and it probably helped to procure him the flattering invitation from Queen Christina which induced him to visit Sweden in 1650. Christina loaded him with gifts and distinctions, but upon the appearance of Milton's book was unable to conceal her conviction that he had been worsted by his antagonist. Milton, addressing Christina herself, ascribes Salmasius's withdrawal from Sweden in 1651 to mortification at this affront, but this appears to be negated by the warmth of Christina's subsequent letters and her pressing invitation to return. The claims of the university of Leyden and dread of a second Swedish winter seem fully adequate motives. Nor is there any foundation for the belief that Milton's invectives hastened his death, which took place on September 3, 1653, from an injudicious use of the Spa waters. He was at the time engaged upon his reply to Milton; this he does not seem to have reckoned among the MSS. which, feeling that he had expressed himself with undue asperity, he directed his wife to burn after his decease. He left several sons, but his posterity did not attain the third generation.

Nothing, to modern ideas, can seem more singular than the literary dictatorship exercised by a mere classical scholar, who shone principally as a commentator, and whose independent works, though highly respectable, evince no especial powers of mind. Salmasius was far enough from being a Grotius, a Leibnitz, or even a Casaubon. As a commentator and verbal critic, however, he is entitled to very high rank. His notes on the *Augustan History* and Solinus display not only massive erudition but massive good sense as well; his perception of the meaning of his author is commonly very acute, and his corrections of the text are frequently highly felicitous. His manly independence was shown in many circumstances of his life, and the general bias of his mind was liberal and sensible. He was accused of sourness and sullenness of temper; but the charge, if it had any foundation, is extenuated by the wretched condition of his health. His biographer Clément enumerates seven classes of disorders which pursued him throughout his life, and which render his industry and productiveness the more extraordinary. Papillon catalogues eighty books published by Salmasius himself, or from his MSS., or to which he contributed notes; eighteen manuscripts which he himself saw in the library of M. de la Mare; forty-three more mentioned by others; ninety-three works with MS. notes by Salmasius, which should now be in the National Library of France; and fifty-nine books projected or contemplated.

The life of Salmasius was written at great length by Philibert de la Mare, counsellor of the parlement of Dijon, who inherited his MSS. from his son. Papillon says that this biography left nothing to desire, but it has the capital fault of never having been printed. It was, however, used by Papillon himself, whose account of Salmasius in his *Bibliothèque des Auteurs de Bourgogne* (Dijon, 1745) is by far the best extant. There is an *éloge* by Clément prefixed to his edition of Salmasius's *Letters* (1656), and another by Morisot, inserted in his own *Letters*. Clément's notice contains many interesting facts, but it is marred by an extravagant admiration for its subject, perhaps excusable if he really believed that his hero was born in 1596, and edited Florus at thirteen. It is remarkable, however, that Clément passes over the *Defensio Regia* almost without notice, whether from feeling that it was unworthy of Salmasius, or because discussion of the subject was discouraged in Holland during the existence of the English Commonwealth. (R. G.)

SALMON. It will be convenient to consider this in connexion with the other members of the great family of fishes to which it belongs. See SALMONIDÆ.

SALMONIDÆ. The distinguishing features of this family of fishes are described in technical language in the article *ICHTHYOLOGY* (vol. xii. p. 693), and it is unnecessary to repeat the definition. The most conspicuous of the external characteristics is the presence of two dorsal fins, of which the anterior is well developed and supported by the usual jointed bones known as fin-rays, while the posterior is thick and fleshy, rounded in outline, and destitute of rays. The posterior fin is thus a rudimentary organ, and it is commonly called the adipose fin. There are two other families of fishes which resemble the *Salmonidæ* in the arrangement of the dorsal fins—the *Percopsidæ* and *Haplochromidæ*; but the former consists of only one species, found in the United States, and the latter is confined to the southern hemisphere. Amongst British fishes a Salmonoid can be always recognized by its dorsal fins.¹

The *Salmonidæ* retain the open communication of the air-bladder with the intestine, and the original posterior position of the pelvic fins,—features which characterize the division of *Teleostei* known as *Physostomi*. In the great assemblage of bony fishes known as *Physoclisti*, these features are lost in the adult condition. It is known that in all cases the air-bladder develops in the young fish as an outgrowth or diverticulum from the intestine; and it is obvious from a survey of Vertebrates in general that the posterior limbs belong originally to the neighbourhood of the anus. It follows therefore that in these features the *Salmonidæ*, and all the *Physostomi*, are more similar to the early ancestors of the bony fishes than are those species in which the air-bladder is closed and the pelvic fins have an anterior position.

In the *Salmonidæ* the characteristic Teleostean pseudo-branchia is present. This organ is the diminished remnant of the series of gill-lamellæ belonging to the posterior face of the hyoid arch, as the pseudobranchia in Elasmobranchs is the rudiment of the series of gill-lamellæ belonging to the posterior face of the mandibular arch.² The bones known as maxillæ form portion of the boundary of the upper jaw in *Salmonidæ*; in many fishes they are excluded from the jaw margin by the backward prolongation of the premaxillæ. There are no scales on the head in this family, and there are no fleshy filaments or "barbels" in the neighbourhood of the mouth as there are in many bony fishes—for example, the Cod, in which a single short barbel is attached beneath the lower jaw. The pyloric appendages, cæcal diverticula of the intestinal tube immediately behind the stomach, are nearly always present in considerable numbers. In the female Salmon the oviduct, the tube connecting the ovary with the exterior, is wanting; the eggs when ripe escape from the surface of the ovary into the abdominal cavity and pass thence to the exterior through a pair of apertures in the body wall situated one on each side of the anus; these apertures are the abdominal pores. In the male salmon there is a duct to the testis, and the semen is extruded through it in the usual way. Fertilization takes place outside the body, the spermatozoa and eggs uniting in the water.

Distribution.—*Salmonidæ* are found both in the sea and in fresh water. Most of the marine species inhabit the deeper parts of the ocean. Many of the freshwater forms pass a portion of their lives in the littoral parts of the sea, ascending rivers when adult every year in order to deposit

¹ It is interesting to observe that a peculiarity of the dorsal fins is often a family character among the bony fishes. Thus the species of the Cod family (*Gadidæ*) have usually three separate dorsal fins similar in shape and size. The *Blenniidæ* are characterized by the presence of a continuous dorsal fin extending almost the whole length of the back. The *Clupeidæ* or Herrings all have a single triangular dorsal fin in the middle of the back.

² This at least is the view till recently accepted by most morphologists; its correctness is questioned by Anton Dohrn.

their spawn; that is to say, many species are anadromous. Some are confined entirely to fresh water. The *Salmonidæ* are, with the exception of one species indigenous to New Zealand, peculiar to the temperate and arctic regions of the northern hemisphere. Fossils belonging to the family are found in strata of Mesozoic age. *Osmerus* occurs in the greensand of Ibbenbüren, and the schists of Glarus and Licata. *Mallotus villosus*, indistinguishable from the living Capelin, occurs abundantly in clay in Greenland, the geological age of the bed being unknown. *Osmeroides acrognathus* and *Aulolepis* are fossil genera occurring in the chalk near Lewes in Sussex, and were probably deep-sea Salmonoids. The introduction of certain species into new areas by human agency, which has been effected recently, and is still going on, will be described in another section.

Synopsis of Genera.

The following five genera include British species:—

1. *Salmo*, Artedi (Salmon and Trout). Scales small. Cleft of mouth wide; maxilla extending backward to below or behind the eye. Dentition well developed; conical teeth on the jaw bones, on the vomer and palatines, and on the tongue; none on the pterygoid bones. Anal fin short, with fourteen or fewer rays. Pyloric appendages numerous. Ova large. Dark transverse bands, known as "parr marks," present on the sides of the body in the young stages of life.

2. *Osmerus*, Cuv. (Smelts). Scales of moderate size. Cleft of the mouth wide; maxilla long, extending to or nearly to the hind margin of the orbit. Dentition well developed; teeth on the maxilla and premaxilla smaller than those on the mandible; transverse series of teeth on the vomer, several of which are large and fang-like; a series of conical teeth along the palatine and pterygoid bones; strong fang-like teeth on the front of the tongue, several longitudinal series of smaller ones on its posterior part. Pyloric appendages short and few in number. Ova small.

3. *Coregonus*. Scales of moderate size. Cleft of mouth small; maxilla rather short, not extending back beyond the orbit. Teeth minute, or absent altogether. Anterior dorsal fin with few rays. Pyloric appendages numerous. Ova small.

4. *Thymallus*, Cuv. (Graylings). Similar to *Coregonus*, but having a long anterior dorsal with many rays. Small teeth on jaws, vomer, and palatine bones.

5. *Argentina*, Cuv. Scales rather large. Cleft of mouth small; maxilla not extending to below the orbit. Teeth wanting on jaws; minute teeth on the head of the vomer and fore part of the palatines; series of small curved teeth on each side of the tongue. Dorsal fin short, in advance of the pelvic. Pyloric appendages few or in moderate numbers. Ova small. The most conspicuous peculiarity of this genus is the flattening of the sides to plane surfaces bordered by keeled ridges, so that the transverse section of the fish is hexagonal.

The following eleven genera include no British species:—

6. *Oncorhynchus*, Suckley (*Ann. Lyc. Nat. Hist.*, 1861). Similar to *Salmo*, except that the anal fin has more than fourteen rays.³

7. *Brachymystax*, Günther. Intermediate between *Salmo* and *Coregonus*.

8. *Lucioperca*, Günther. Migratory trout from North America.

9. *Plecoglossus*, Schlegel. Body covered with very small scales. Cleft of mouth wide; maxilla long. Dentition feeble; premaxilla with few small conical teeth. Ends of mandibles separate at the chin, the mucous membrane between them forming folds and pouches. Tongue very small, with minute teeth.

10. *Retropinna*, Gill. Similar to *Osmerus*.

11 and 12. *Hypomesus*, Gill, and *Thaleichthys*, Girard, are allied genera.

13. *Mallotus*, Cuv. (Capelin). Scales minute, somewhat larger along the lateral line and along each side of the belly. In mature males those scales become elongate, lanceolate with projecting points. Cleft of mouth wide; maxilla very thin, lamelliform, extending to below middle of eye. Dentition very feeble; teeth in single series. Pyloric appendages very short, few. Ova small.

14. *Salanx*, Cuv. Body elongate, compressed, naked, or with small, exceedingly fine deciduous scales. Head elongate and much depressed, terminating in a long, flat, pointed snout. Cleft of mouth wide. Jaws and palatine bones with conical teeth, some of those on premaxilla and mandibles being enlarged; no teeth on vomer; tongue with single series of curved teeth. Anterior dorsal fin far behind ventral, in front of anal; adipose small. Pseudo-branchia well developed; air-bladder none. Alimentary canal quite straight; pyloric appendages none. Ova small.

³ This is the generic distinction adopted by Dr Günther. Suckley's original diagnosis was the prolongation of both jaws in the males.

15. *Microstoma*, Cuv. Body elongate, cylindrical, covered with large thin silvery scales. Cleft of mouth very small; premaxilla very small; maxillæ very short and broad. Eye very large. Narrow series of very small teeth in the lower jaw and across the head of the vomer; no other teeth. Dorsal fin short, inserted behind the ventrals, but before the anal; adipose fin present in most young specimens, frequently absent in old ones. Pseudo-branchiæ well developed; air-bladder large. Pyloric appendages absent; mucous membrane of stomach with numerous large papillæ. The genus is allied to *Argentina*.

16. *Bathylagus*, a genus of deep sea Salmonoids discovered by the "Challenger" in the Atlantic and Antarctic Oceans at depths of 1950 and 2040 fathoms.

Species.

1. Genus *Salmo*. The difficulty of defining and distinguishing the species of this genus is considerable, and much diversity of opinion on the subject exists among ichthyologists. Many of the species are extremely variable, so that some individuals of one resemble the more aberrant individuals of another; the species are seldom separated by conspicuous differences. The individuals of a given species vary considerably with age and sex, and also with habitat and external conditions. Many of the species are capable of breeding together and producing fertile offspring. The characters which are most constant, and on whose differences the distinction of species chiefly rests, are as follows:—(1) the form of the preoperculum (the horizontal breadth of this bone at its lower portion is always small in the young, but in the adult it is greater in some species than in others; (2) width and strength of maxillary in adult; (3) size of teeth; (4) arrangement and permanence of vomerine teeth; (5) form of caudal fin; (6) pectoral fins; (7) size of scales; (8) number of vertebrae; (9) number of pyloric appendages.

In all the species of *Salmo* there are teeth in the vomer. In the Salmon proper and in the Trout there are, in the young, teeth both on the head and body of that bone, but in some species on the body only; some of the teeth on the body are deciduous, and are in most of the species shed at an early age. In the Charrs there are teeth on the head of the vomer but none on the body of the bone at any period of life, and none of the vomerine teeth are deciduous. The species of true Trout are confined to fresh water, and are not migratory. In accordance with these peculiarities some zoologists have divided the genus *Salmo* into three subgenera,—*Salmo sensu restricto*, *Fario*, and *Salvelinus*. But modern authorities retain only two subdivisions,—the subgenera *Salmo*, including migratory Salmon and non-migratory Trout, and *Salvelinus*, the Charrs.

A. Subgenus *SALMO*.—A vast number of species of *Salmo* have been described; in the *Brit. Mus. Cat.* Dr Günther distinguishes fifty-two, of which seven are confined to the British Islands and four are found both in the British Islands and other parts of the world. Mr Day on the other hand considers that all the indigenous Salmon and Trout of the British Islands belong to two species, *Salmo salar* and *Salmo trutta*,—*Salmo leuvenensis* and *Salmo fario* being varieties of the latter; the rest of the described British species he considers as local varieties or subvarieties of these.

(1) *Salmo salar*, L. (the Salmon). B. 11–12; D. 14; A. 11; P. 14; V. 9; L. lat. 120; L. transverse $\frac{22-26}{19-22}$; Vert. 59–60; Cæc. pyl. 53–77.¹ Attains to a length of 4 to 5 feet; female mature at a length of about 15 inches. Preoperculum with a distinct lower limb and with the angle rounded. Head of vomer subpentagonal, as long as broad, toothless; the body of the bone with single series of small teeth which are gradually lost from behind forwards so that older examples only have from one to four left. Hind part of body elongate and covered with relatively large scales. Young with about eleven dusky transverse bars on the sides; half-grown and old specimens silvery, with small black spots in small number; spawning males with numerous large black and red spots, some of the red spots confluent into more or less extensive patches, especially on the belly. An anadromous species, inhabiting temperate Europe southwards to 43° N. lat.; not found in Mediterranean; in Asia and America southwards to 41° N. lat.

No varieties of *Salmo salar* are recognized in Europe, but in North America there occurs one Salmonoid which is considered by different authorities either as a variety or a sub-species, viz., *Salmo salar*, var. *sebagi*, L. lat. 115. Body and dorsal and caudal fins with subquadrangular or subcircular black spots. Is non-migratory and occurs in some of the lakes of Maine and New York in the United States; these lakes have no communication with the sea. This form is called variously the Landlocked Salmon or the Schoodic Salmon.

The true *Salmo salar* on the American shore of the Atlantic is sometimes called the Penobscot Salmon.

(2) *Salmo trutta*, Fleming; *Salmo eriox*, Parnell (*Fishes of Firth of Forth*) (Sea-Trout, Salmon-Trout, Bull-Trout). B. 11; D. 13; A. 11; P. 15; V. 9; L. lat. 120; L. transverse $\frac{24-26}{20-22}$; Vert. 59–60; Cæc. pyl. 49–61. Attains to a length of about 3 feet; female mature at a length of 10 to 12 inches. Head of vomer triangular, as broad as long, toothless, body of the bone with a longitudinal ridge armed with a single series of teeth, which are deciduous; generally only the two or three anterior ones found in examples of more than 20 inches in length. Silvery, sometimes immaculate, usually with more or less numerous X-shaped spots; spots on the head and dorsal fin round and readily disappearing. Young (parr) with nine or ten dusky cross bars; grilse with top of dorsal and pectoral and with hind margin of caudal black. A migratory species, occurring in the rivers falling into the Baltic and German Ocean; numerous in Scotland, less frequent in English and Irish rivers.

(3) *Salmo cambricus*, Donov. (*Brit. Fishes*) (the Sewen of Couch, Salmon Peal). B. 10–11; D. 14; A. 11–12; P. 16; V. 9; L. lat. 120–125; L. transverse $\frac{27}{28-30}$; Vert. 59; Cæc. pyl. 39–47. Attaining to a length of 3 feet; female mature at a length of from 12 to 13 inches. Preoperculum with a distinct lower limb, with the angle rounded and with the hind margin convex or undulated, subvertical. Head of vomer triangular, broader than long, toothless in adult examples, armed with a few teeth across its hinder margin in young ones; body of the bone with a sharp longitudinal ridge, in the sides of which the teeth are inserted, forming a single series, and alternately pointing to right and left. In pure-bred specimens these teeth are lost in the grilse state, so that only the two or three anterior remain in specimens more than 12 or 13 inches long. Fins of moderate length; caudal fin forked in parr stage, slightly emarginate in grilse, truncate in mature specimens. This species loses the parr marks very early, when only 5 to 6 inches long; it is then bright silvery. Greenish on the back, with few small round black spots on the head and sides. This coloration remains nearly unaltered during the further growth of the fish, but the spots become more irregular, indistinctly X-shaped. An anadromous species, occurring in rivers of Norway, Denmark, Wales, and Ireland. Mr Day (*Fishes of Great Britain*) considers this form as merely a variety of *Salmo trutta*.

(4) *Salmo fario*, L. (Trout). Dr Günther distinguishes two varieties:—

(a) *Salmo fario gaimardi*; *Salmo gaimardi*, Cuv. and Val.; *Salmo trutta*, Gaimard (*Voy. Isl. and Groenl.*, Atl. Poiss., pl. 15, fig. A). D. 13–14; A. 11–12; P. 14; V. 9; L. lat. 120; L. transverse $\frac{27}{28}$; Cæc. pyl. 33–46; Vert. 59–60. Largest specimen observed, 15 inches; female mature at a length of 7 or 8 inches. Head of vomer triangular, small, broader than long; vomerine teeth in a double series sometimes disposed in a zigzag line, persistent throughout life. Sides with numerous round or X-shaped black spots; upper surface and sides of the head and the dorsal, adipose, and caudal fins usually with crowded round black spots; dorsal, anal, and ventral with a black and white outer edge. Found in Iceland, North Britain, Ireland, Scandinavia.

(b) *Salmo fario ausonii*; *Salmo ausonii*, Cuv. and Val. (the common River-Trout). Formula as in a, but Vert. 57–58. Attains to a length of 30 inches; female mature at a length of 8 inches. A non-migratory species, inhabiting numerous fresh waters of Central Europe, Sweden, and England, and rivers of the Maritime Alps.

The following forms are peculiar to the British Islands:—

(5) *Salmo leuvenensis*, Walker (*Wern. Mem.*, i. p. 541) (Loch Leven Trout). D. 13; A. 11; P. 14; V. 9; L. lat. 118; L. transverse $\frac{28}{28}$; Cæc. pyl. 68–80; Vert. 59. Maximum length 21 inches. Teeth moderately strong; the head of the vomer triangular with a transverse series of two or three teeth across its base; the teeth of the body of the vomer form a single series and are persistent throughout life. Upper parts brownish or greenish olive; sides of the head with round black spots; sides of the body with X-shaped, sometimes rounded, brown spots. Dorsal and adipose fins with numerous small brown spots. A non-migratory species, inhabiting Loch Leven and other lakes of southern Scotland and northern England. This species is considered by Mr Day as a variety of *S. trutta*.

(6) *S. brachypoma*, Günther; *S. eriox*, Parnell (*Fish. Firth of Forth*). D. 13; A. 10–11; P. 14; V. 9; L. lat. 118–123; L. transverse $\frac{27}{28}$; Cæc. pyl. 45–47; Vert. 59. Preoperculum with scarcely a trace of lower limb. Teeth rather strong; those of the vomer in double series, but in zigzag line. Most of them are lost in specimens 17 inches long, only a few of the anterior remaining. Sides of the body with X-shaped or ocellated black spots, some red spots along and below the lateral line; dorsal fin with round black spots. Dorsal, anal, and ventral fins with a white and black outer margin in young examples. A migratory species, from the rivers Forth, Tweed, and Ouse. According to Mr Day, it is identical with the White Salmon of Pennant and *Salmo albus* of Cuv. and Val.,

¹ In the formula usually preceding the diagnosis or description of a species of fish, B=number of branchiostegal rays; D=number of rays in dorsal fin; P=ditto in pectoral fin; A=ditto in anal fin; V=ditto in ventral fin; L. lat.=number of scales along the lateral line; L. transverse=number of scales in the oblique transverse row of the widest part of the body, the numbers above and below the line in the fraction being those of the scales above and below the lateral line respectively.

all of them being considered by Day as a variety, *S. albus*, of *Salmo trutta*.

(7) *S. gallivensis*, Günther. An anadromous species from Galway, distinguished by the acutely pointed but not elongate snout, broad convex head, small eye, feeble teeth, feeble maxillary and mandible, and by extremely thin and short pyloric appendages, which are not longer than one inch nor thicker than a pigeon's quill. According to Day a variety of *S. fario*.

(8) *S. ferox*, Jard. and Selby (*Edinb. New Philos. Journal*, 1835, xviii.). A non-migratory species inhabiting the large lochs of the north of Scotland and several lakes of the north of England, Wales, and Ireland. Præoperculum crescent-shaped, the hinder and lower margins passing into each other without forming an angle. According to Day a variety of *S. fario*.

(9) *S. orcadensis*, Günther, from Loch Stennis in Orkney.

(10) *S. stomachicus*, Günther (the Gillaroo). From lakes of Ireland. Thick stomach. Feeds on shells (*Limnæus*, *Ancylus*).

(11) *S. nigripinnis*, Günther. Non-migratory species inhabiting mountain pools of Wales, also Lough Melvin, Ireland.

Day mentions also the following varieties of *S. fario* :—

S. cornubiensis, Walb., Artdi;

Swaledale trout, from Swaledale, Yorkshire; and

Crassapuill trout, from Loch Crassapuill, Sutherlandshire.

Many species of *Salmo* exist which are confined to limited areas in the continent of Europe. An account of these is given in the *Brit. Mus. Catalogue*, which also contains references to the literature. One of these, *S. macrostigma*, Duméril, is a non-migratory form occurring in Algeria, and is the southernmost species of the Old World. Three non-migratory species exist in the rivers belonging to the basin of the Adriatic. In the Alpine lakes of central Europe five species are known, which resemble in habits the forms found in British lakes, ascending the streams which feed the lakes, in order to spawn. Two of these species inhabit the Lake of Constance, one the Lake of Geneva. *Fario argenteus*, Cuv. and Val., found in the Atlantic rivers of France, is considered by Dr Günther a distinct species, by Mr Day as a synonym of *S. trutta*. One migratory species is known from the Eidfjord river in Norway; two land-locked species from Lake Wener in Sweden.

The species of *Salmo* belonging to the Pacific Coast of North America have been described by Richards in *Faun. Bor. Amer.*, by Suckley in *Nat. Hist. Washington Territory*, and by Girard in *Proc. Acad. Nat. Sc. Philad.* Only one species need be mentioned here, and that on account of the importance it has acquired in connexion with the work of the United States Fish Commission :—

Salmo irideus, Gibbons (*Proc. Cal. Ac. Nat. Sc.*, 1856, p. 36); *Salar iridea*, Girard (*Proc. Acad. Nat. Sc. Philad.*, 1856, p. 220 and *U. S. Pac. R. R. Explor.—Fish.*, p. 321, pl. 73, f. 5, and pl. 74) (the Californian, Mountain, or Rainbow Trout). B. 10; D. 14; A. 14; L. lat. 140. Caudal deeply emarginate. Body and dorsal and caudal fins with numerous small black spots. A non-migratory species in rivers of Upper California.

For the same reason as in the preceding case, the following species of the eastern slope of the North American continent is introduced :—

Salmo namaycush, Penn (*Arct. Zool.*, ii. p. 189), Cuv. and Val. (xxi. p. 348) (Lake Trout). B. 11–12; D. 13–14; A. 12; V. 9; L. lat. 220. Præoperculum very short, without lower limb; head very large. Teeth strong; those on the vomer persistent throughout life, and in single series. Inhabits all the great lakes of the northern part of North America.

B. Subgenus SALVELINUS :—

Salmo alpinus, L. (the Charr, Yarrell, *Brit. Fishes*, 3d ed.). D. 13; A. 12; P. 13; V. 10; L. lat. 195–200; Vert. 59–62; Cæc. pyl. 36–42. Body slightly compressed and elongate. Length of head equal to height of body in mature specimens and two-ninths or one-fifth of total length; maxillary extends but little beyond the orbit in the fully adult fish. Eye one-half, or less than one-half, of the width of the interorbital space. Teeth of moderate size. Inhabits lakes of Scandinavia, Scotland (Helier Lake, Hoy Island, Orkneys; Sutherlandshire; Loch Roy, Inverness-shire), and probably Iceland.

S. killinensis, Günther (*Proc. Zool. Soc.*, 1865, p. 699). D. 14–15; A. 13; P. 13; V. 9; L. lat. 180; Vert. 62; Cæc. pyl. 44–52. Head, upper parts, and fins brownish black; lower parts with an orange-coloured tinge in the male; sides with very small, light, inconspicuous spots. Anterior margins of the lower fins white or light-orange-coloured. Loch Killin, Inverness-shire. Considered by Mr Day as a variety of *S. alpinus*.

S. willughbii, Günther (*Proc. Zool. Soc.*, 1862, p. 46, pl. 5); Charr, Willughby (*Hist. Pisc.*, p. 196), Penn (*Brit. Zool.*), and Yarrell (*Brit. Fish.*, 3d ed.) (the Charr of Windermere). D. 12–13; A. 12; P. 13–14; V. 9–10; L. lat. 165; Vert. 59–62; Cæc. pyl. 32–44. Sides with red dots; belly red; pectoral, ventral, and anal with white margins. Lake of Windermere; Loch Bruiach (Scotland). Considered by Mr Day as a variety of *S. alpinus*.

S. perisii, Günther (*Ann. and Mag. Nat. Hist.*, 1865, p. 75);

Torgoch, Willughby (*Hist. Pisc.*) and Penn (*Brit. Zool.*) (the Torgoch or Red Charr). D. 13; A. 12; P. 12; V. 9; L. lat. 170; Vert. 61; Cæc. pyl. 36. Sides with numerous red dots; belly red in the mature fish; pectoral, ventral, and anal with white margins. Lakes of North Wales (Llanberis). Considered by Mr Day as a variety of *S. alpinus*.

S. grayi, Günther (*Proc. Zool. Soc.*, 1862, p. 51). D. 13; A. 12; P. 13–14; V. 9; L. lat. 125; Vert. 60; Cæc. pyl. 37. Sides with scattered light-orange-coloured dots; belly uniform silvery whitish, or with a light-red shade; fins blackish. Lough Melvin, Ireland. Considered by Mr Day as a variety of *S. alpinus*.

S. colii, Günther (*Proc. Zool. Soc.*, 1863) (Cole's Charr, Couch, *Fish. Brit. Isles*). D. 14; A. 12; P. 13; V. 9; L. lat. 160; Vert. 63; Cæc. pyl. 42. Bluish black above; sides silvery with scattered light-salmon-coloured dots; belly reddish; fins black, the anal and the paired fins with a reddish tinge, the anal and ventrals with a narrow whitish margin. A small species 7 to 8 inches long from Loughs Eske and Dan, Ireland. Considered by Mr Day as a variety of *S. alpinus*.

The above are all the British species.

S. umbla, L. (*Syst. Nat.*), Cuv. and Val. D. 12; A. 12–13; P. 14; V. 9; L. lat. 200; Vert. 65; Cæc. pyl. 36. Commonly called in French *Ombre Chevalier*. Lower parts whitish or but slightly tinged with red. Lakes of Constance, Neuchâtel, and Geneva. Considered by Mr Day as identical with *S. alpinus*. Other species have been described from lakes in Europe and Asia, but are imperfectly known; for an account of them see Günther's *Catalogue*.

The following American species of Charr is one of those cultivated by the American Fish Commission :—

S. (Salvelinus) fontinalis, Mitch. (*Trans. Lit. and Phil. Soc.*, New York, i. p. 435), Cuv. and Val. (xxi. p. 266) (Brook Trout). B. 12; D. 12; A. 10; L. lat. 200; Cæc. pyl. 34. No median series of teeth along the hyoid bone. Præoperculum short in longitudinal direction, with the lower limb very indistinct. Rivers and lakes of British North America, and of the northern parts of the United States. Introduced in Britain.

2. Of the genus *Osmerus* only three species are described in the *Brit. Mus. Cat.*, one of which is British :—

Osmerus eperlanus, Lacép., Linn. (the Smelt; Fr., *Éperlan*; Scotch, *Sparling* or *Spirling*). B. 8; D. 11; A. 13–16; P. 11; V. 8; L. lat. 60–62; L. transverse $\frac{1}{4}$; Cæc. pyl. 2–6; Vert. 60–62. Height of body much less than length of the head, which is a quarter or two-ninths of the total length to base of caudal fin. Snout produced. Vomerine teeth and anterior lingual teeth large, fang-like; posterior mandibular teeth larger than the anterior ones, which form a double series, the inner series containing stronger teeth than the outer one. Back transparent, greenish; sides silvery. Adult size 10 or 12 inches. Coasts and numerous fresh waters of northern and central Europe.

Osmerus viridescens, Lesueur, another species scarcely distinct from *O. eperlanus*, but with scales a little smaller, occurring on the Atlantic side of the United States.

Osmerus thaleichthys, Ayres, occurs abundantly in the Bay of San Francisco.

3. Of *Coregonus* forty-one species are described in the *Brit. Mus. Cat.* Four species are found in Britain :—

C. oxyrinchus, Kröyer, Linn., Cuv. and Val. (xxi.). Called the *Houting* in Holland. B. 9; D. 14; A. 14–15; L. lat. 75–81; L. transverse $\frac{2-10}{12}$; Vert. 58. Snout produced, with the upper jaw protruding beyond the lower, and in adult specimens produced into a fleshy cone. Length of the lower limb of operculum $1\frac{1}{2}$ to $1\frac{1}{4}$ times that of the upper. Pectoral as long as the head without snout. Found on coasts and in estuaries of Holland, Germany, Denmark, and Sweden. Captured recently (three specimens only) in Lincolnshire, near Chichester, and at the mouth of the Medway.

C. chupeoides, Lacépède; *C. pennantii*, Cuv. and Val. (the Gwyniad of Lake Bala, Schelly of Ullswater, Powan of Loch Lomond; sometimes called the Freshwater Herring). B. 9; D. 14–15; A. 13–16; L. lat. 73–90; L. transverse $\frac{1}{2}$; Cæc. pyl. 120; Vert. 38/20. Snout with upper jaw not produced. Pectoral larger than the head. Fins black or nearly so. Lakes of Great Britain.

C. vandesius, Richards (*Faun. Bor. Amer.*); *C. albulus*, Cuv. and Val. (the Vendace). D. 11; A. 13; V. 11; L. lat. 68–71; L. transverse $\frac{1}{2}$; Vert. 56. Castle Loch, Lochmaben in Dumfriesshire.

C. pollan, Thompson (*Proc. Zool. Soc.*, 1835), Cuv. and Val. (the Pollan). D. 13–14; A. 12–13; V. 12; L. lat. 80–86; L. transverse $\frac{1}{2}$; Vert. 60–61. Two jaws of same length. Teeth if present very minute. Bluish along the back, silvery along the sides and beneath. Usual length of adults 10 to 11 inches, maximum 13 inches. Ireland, in Loughs Neagh, Erne, Derg, Corrib, and the Shannon.

Thirty-seven species of *Coregonus* have been distinguished besides these four. Some are migratory; but the greater number are inhabitants of large lakes. The anadromous species are confined to the Arctic Sea, and the greater number belong to the coast and

rivers of Siberia. Several distinct species occur in the lakes of Sweden; a few are found in the lakes of Switzerland and central Europe. *C. hiemalis* is peculiar to the Lake of Constance. Several species inhabit the great freshwater lakes connected with the river St Lawrence of North America, and the lakes farther to the north. One of these is cultivated by the American Fish Commission:—

Coregonus clupeiformis, Mitchell, Dekay (*New York Fauna, Fish*), Cuv. and Val., Agassiz (*Lake Superior*) (the Shad Salmon, Freshwater Herring, Whitefish). D. 12; A. 14; L. lat. 76–77; L. transverse $\frac{2}{3}$. The snout is pointed, and there is an appendage to the ventral fin which is half as long as the fin itself. Length of adult 11 to 13 inches. Lakes Erie and Ontario.

4. Only one species of *Thymallus* occurs in the British Islands:—*Thymallus vulgaris*, Nilsson; *Thymallus vecillifer*, Cuv. and Val. (the Grayling; French, *L'Ombre*; Italian, *Temolo*). B. 7–8; D. 20–23; A. 13–16; P. 16; V. 10–11; L. lat. 75–85; L. transverse $\frac{2}{3}$; Cæc. pyl. 22; Vert. 39/22. Length of head two-ninths or one-fifth of total length to base of caudal; posterior dorsal rays somewhat produced in adult. Grows to 15 inches in length. A freshwater fish, common in many of the rivers of England, introduced into some of those of southern Scotland; absent from Ireland. It is widely distributed in central and northern Europe, occurring in Lapland, Sweden, Lake of Constance, the Isar, and the Danube. Adult size about 15 inches.

Thymallus aliani, Cuv. and Val. (*Θύμαλλος*, *Æl.*, xiv. 22), occurs in Lago Maggiore. One species has been described from Siberia, and two are known inhabiting Lake Michigan and the waters of British North America.

5. Of *Argentina* four species are described in the *Brit. Mus. Cat.*, namely:—*Argentina silus*, Nilsson, occurring off the north-west coast of Norway, *Argentina sphyreæna*, L., from the Mediterranean, *Argentina hebridica*, Nilsson, found on the coasts of Norway and Scotland, and *Argentina bioglossa*, Cuv. and Val. According to Mr Day, two of these, *A. sphyreæna* and *A. hebridica* are identical, the species ranging from the coast of Norway and east and west shores of Scotland to the Mediterranean. The following is the formula of *A. hebridica*, Nilsson, according to Günther:—D. 9–11; A. 13 (12); P. 13–14; V. 11; L. lat. 52–53; Cæc. pyl. 14–20; Vert. 52. The scales with minute spines.

6. The species of *Oncorhynchus* are all anadromous, and are confined to American and Asiatic rivers flowing into the Pacific. *O. quinnat*, Richardson = *O. chowicha* occurs in the river Sacramento, and is cultivated by the American Fish Commission.

7, 8. For *Brachymystax* and *Lucioperca*, see p. 221 above.

9. *Plecoglossus* comprises small aberrant freshwater species abundant in Japan and the island of Formosa.

10. *Retropinna* contains but one species, *R. richardsonii*, which is known as the New Zealand Smelt. It is common on the coasts of New Zealand, ascending estuaries. Like *Osmerus eperlanus*, it is landlocked in fresh water in some localities.

11, 12. The species of *Hypomesus* and *Thaleichthys* occur on the Pacific coast of North America. *Thaleichthys pacificus*, Girard, is caught in vast numbers in the neighbourhood of Vancouver Island; it is extremely fat, and is used as a torch when dried, and also as food. It is called locally the Eulachan or Oulachan.

13. Of *Mallotus* only one species is described by Günther:—

Mallotus villosus, Cuv. and Val., Müll. (the Capelin; French, *Capelan*). B. 8–10; D. 13–14; A. 21–23; P. 18–20; V. 8; Cæc. pyl. 6; Vert. 68. Brownish on the back, silvery on the sides. Operculum silvery with minute brown dots. Shores of Arctic North America and of Kamchatka.

14. Of the genus *Salanx* two species are known:—*Salanx chinensis*, Günther, Osbeck, which is common on the coast of China and called "Whitebait" at Macao, and *Salanx microdon*, Bleeker, from the rivers of Jeddo.

15. *Microstoma*.—*M. rotundatum*, Risso, is marine and occurs in the Mediterranean; it is not anadromous. It is the only species of the genus known, unless the *Microstomus grönlandicus*, described by Reinhardt, from the Sea of Greenland, really belongs to this genus.

16. For *Bathylagus*, see p. 222 above.

Life History of the Salmon and Allied Species.

Up to a period not many years past, when our knowledge of the breeding and life history of the salmon and kindred species was based entirely on desultory observations of the fish in their natural conditions, there existed a great deal of uncertainty and diversity of opinion on the subject. Within the last twenty or thirty years the extensive practice of salmon-culture has removed nearly all obscurity from the phenomena, and the history of Salmonoids is now more accurately known than that of most other fishes.

The salmon proper, *Salmo salar*, breeds in the shallow running waters of the upper streams of the rivers it ascends. The female, when about to deposit her eggs, scoops out a trough in the gravel of the bed of the stream. This she effects by lying on her side and plunging into the gravel by energetic motions of her body. She

then deposits her eggs in the trough; while she is engaged in these operations she is attended by a male, who sheds milt over the eggs as the female extrudes them, fertilization being, as in the great majority of *Teleostei*, external. The parent fish then fill up the trough and heap up the gravel over the eggs until these are covered to a depth of some feet. The gravel heap thus formed is called a "redd." The period of the year at which spawning takes place in the British Isles, and in similar latitudes of the northern hemisphere, varies to a certain extent with the locality, and in a given locality may vary in different years; but, with rare exceptions, spawning is confined to the period between the beginning of September and the middle of January.

The eggs of *Salmo salar* are spherical and non-adhesive; they are heavier than water, and are moderately tough and elastic. The size varies slightly with the age of the parent fish, those from full-sized females being slightly larger than those from very young fish. According to rough calculations made at salmon-breeding establishments, there are 25,000 eggs to a gallon; the diameter is about a quarter of an inch. It is usually estimated that a female salmon produces about 900 eggs for each pound of her own weight; but this average is often exceeded.

The time between fertilization and hatching, or the escape of the young fish from the egg-membrane, varies considerably with the temperature to which the eggs are exposed. It has been found that at a constant temperature of 41° F. the period is 97 days; but the period may be as short as 70 days and as long as 150 days without injury to the health of the embryo. It follows therefore that in the natural conditions eggs deposited in the autumn are hatched in the early spring. The newly hatched fish, or "alevin," is provided with a very large yolk-sac, and by the absorption of the yolk contained in this the young creature is nourished for some time; although its mouth is fully formed and open, it takes no food. The alevin stage lasts for about six weeks, and at the end of it the young fish is about 1½ inches long. During the next period of its life the young salmon is called a "parr," and is distinguished by the possession of a number of dark transverse marks along the sides, known as "parr marks." These marks occur in the young stage of many species among the *Salmonidæ*. The parr doubles its length in about four months.

The great majority of parr remain in fresh water for two years after hatching, at the end of which time they are about 8 inches in length. The second spring after they are hatched they develop a coating of bright silvery scales which completely conceals the parr marks, and they pass into a stage in which they are known as "smolts." The smolt is similar to the adult salmon in all respects except size, and the young salmon, as soon as the smolt stage is reached, migrates down the rivers to the sea.

The above facts have been established within recent years by accurate observation and experiment. Not very long ago it was a disputed question whether the parr was the young salmon or a distinct species of fish. That the former view was correct was first experimentally proved by Mr John Shaw, gamekeeper to the duke of Buccleuch, Drumlanrig, Dumfriesshire, who in 1833 isolated several parrs in a pond, and found that in April 1834 they changed into smolts; an account of this experiment was published in the *Transactions of the Royal Society of Edinburgh*. The question is now of merely historical interest, for at the present time large numbers of parr are hatched at various fish-hatching establishments every season. By observation at these establishments, the knowledge of the history of the parr and the migration of the smolt which had been gained by the study of the fish in their natural conditions has been rendered more accurate and complete.¹ It has been conclusively ascertained that some parr become smolts and migrate to the sea in the spring following that in which they were hatched, while the great majority remain in the parr stage until the second spring, and a few do not attain to the smolt condition until the third year. The male parr when only 7 or 8 inches in length is often sexually mature, the milt being capable of fertilizing the ova of an adult female salmon.

The migration of smolts to the sea takes place in all rivers at about the same time of the year, viz., between March and June. Sometimes the smolts are observed descending in large shoals. Formerly angling for the descending smolts was a recognized sport, but their capture is now illegal. It is the opinion of the most competent authorities that the smolts increase with wonderful rapidity in size and weight when they reach the sea, and then return to the rivers after a few months, during the same year, as "grilse," which name is given to sexually mature salmon up to a little over 5 lb in weight. It is surprising that a smolt weighing only a few ounces should increase to 3 or 4 or even 6 lb in about three months. Nevertheless it has been proved by actual experiment that this is the fact. At Stormontfield, in May 1855, 1800 smolts were marked by cutting off the adipose fin, and 22 of these

¹ The first important series of experiments on the growth and life history of the salmon was made at the salmon-hatchery of Stormontfield near Perth in 1862 and some previous years. The results are detailed in a work entitled *Stormontfield Experiments*, 1862.

were recaptured the same summer as grilse, weighing from 3 lb upwards. It might be supposed that some smolts do not return as grilse till the summer following the year of their descent, the time of their stay in the sea being variable, as is the period spent by parr in the rivers. But all the evidence is against this supposition; grilse never commence ascending till late in summer; if they had been more than a year in the sea, some would probably ascend early in the season, as do the larger salmon. At the same time it must be borne in mind that a fish which remained in the sea a year after descending as a smolt might not be recognized as a grilse, having reached the size of a small salmon.

The grilse, after spawning in autumn, return again to the sea in the winter or following spring, and reascend the rivers as mature spawning salmon in the following year. Both salmon and grilse after spawning are called "kelts." The following recorded experiment illustrates the growth of grilse into salmon:—a grilse-kelt of 2 lb was marked on March 31, 1858, and recaptured on August 2 of the same year as a salmon of 8 lb.

The ascent of rivers by adult salmon is not so regular as that of grilse, and the knowledge of the subject is not at the present time complete. Although salmon scarcely ever spawn before the month of September, they do not ascend in shoals just before that season; the time of ascent extends throughout the spring and summer. A salmon newly arrived in fresh water from the sea is called a clean salmon, on account of its bright, well-fed appearance; during their stay in the rivers the fish lose the brilliancy of their scales and deteriorate in condition. The time of year at which clean salmon ascend from the sea varies greatly in different rivers; and rivers are, in relation to this subject, usually denominated early or late. The Scottish rivers flowing into the German Ocean and Pentland Firth are almost all early, while those of the Atlantic slope are late. The Thurso in Caithness and the Naver in Sutherlandshire contain fresh-run salmon in December and January; the same is the case with the Tay. In Yorkshire salmon commence their ascent in July, August, or September if the season is wet, but if it is dry their migration is delayed till the autumn rains set in. In all rivers more salmon ascend immediately after a spate or flood than when the river is low, and more with the flood tide than during the ebb.

In their ascent salmon are able to pass obstructions, such as waterfalls and weirs of considerable height, and the leaps they make in surmounting such impediments and the persistence of their efforts are very remarkable. In a great many rivers anadromous Salmonoids have been excluded from the upper reaches by artificial obstructions, such as dams and weirs, constructed for the purpose of utilizing the water of the stream, or to obtain water power, or simply to facilitate the capture of the fish. Other rivers have been rendered uninhabitable to salmon by pollutions. The state of the Thames within the boundaries of London has since the beginning of the present century excluded Salmonoids entirely from the river; but every season salmon and grilse are taken in or near the Thames estuary, and there is no doubt that if the water could again be rendered moderately clear, and if fish-ways were provided at the impassable weirs, the upper waters of the Thames would again be frequented by salmon and migratory trout.

The life history of *Salmo trutta* and *S. cambricus* is very similar to that of *Salmo salar*. The river trout, *S. fario*, makes a redd in the shallower parts of streams in the same manner as the salmon, the only difference being that the mound of gravel forming the redd is smaller, the egg lying from one to two feet below the surface. The breeding period of the trout varies in different rivers, within the limits of September and March.¹ The number of eggs produced by each female is about 800 for every pound of the parent's weight; about 40,000 of the eggs make a gallon, so that they are considerably smaller than those of *S. salar*. The trout of Loch Leven, *S. levenensis*, ascend the streams feeding the loch, in order to spawn, at the end of September and beginning of October. The habits of other species of lake trout are similar to those of *S. levenensis*.

The charrs differ from lake trout in the fact that they do not ascend streams in order to spawn, but form their redds in the gravelly shallows of the lakes they inhabit. The spawning period of the charr of the Cumberland lake district is from the beginning of November to the beginning of December. The eggs of the charr have been found to hatch in from 60 to 90 days, the great majority in 70 days, at an average temperature of 40° F. The American species, *S. fontinalis*, breeds at about the same time as *S. fario*; its eggs are only half the size of those of the latter.

The smelt, *O. eperlanus*, is a gregarious fish and exhibits regular migrations in most estuaries. It is common in the Solway, the Firth of Forth, the rivers of Norfolk, and the estuary of the Thames. In most places where it is found it remains in the fresh and brackish water from August until May, spawning about the month of April, and afterwards descending to the sea for the

summer. At Alloa on the Forth smelts are taken in large numbers by seine nets in spring, before and during the spawning period. There is a regular fishery for them at the same season on the Solway Firth and in Norfolk. The food of the smelt consists chiefly of young fish, especially young herrings, and crustaceans. The eggs are small, yellowish in colour, and adhesive, not adhering by the surface merely as is the case with those of the herring, but each egg possessing a short thread the end of which becomes attached to planks, stones, or other solid objects in the water. According to Mr Day the eggs are deposited near the high-water mark of spring-tides, so that they must be exposed to the air during the ebb. The smelt when in the sea is largely eaten by the picked dog-fish (*Acanthias vulgaris*). The species is absent from the southern coast of England and from Ireland, the smelt recorded as occurring on those coasts being probably the atherine (*Atherina*), often called the sand-smelt. *O. eperlanus* is abundant on the coast of Finland, and also is common there in freshwater lakes, in which it remains all the year round. It is also common on the Atlantic coast of France. It is of interest to note that the smelt in Britain and on other coasts, when not confined to fresh water, is, in its migration, intermediate between anadromous *Salmonidæ*, which ascend to near the sources of rivers, and such fish as the herring, which approach the shore to spawn but do not usually enter rivers. The smelt as a rule ascends estuaries only as far as the region of brackish water.

The various species of *Coregonus* resemble the charr in their habits, spawning in the autumn in the shallows of the lakes they inhabit; their ova are small, and, as mentioned in PISCICULTURE (q.v.), are non-adhesive and of almost the same specific gravity as fresh water, so that they are semi-buoyant.

The grayling, *Thymallus vulgaris*, is in Britain exclusively fluviatile; in Scandinavia it is found also in lakes. It is met with chiefly in clear streams with sandy gravels or loamy beds. It was introduced not many years ago into the Tweed by the marquis of Lothian, and thrives there. It is absent from the Thames, but is common in most of the rivers of England and Wales—e.g., the rivers of Yorkshire, the Severn, and the Wye. It is absent from Ireland. It feeds on insects and their larvae, crustaceans, and small molluscs. It breeds in April and May, depositing its ova on the surface of the gravel in the shallows, not in a redd. The ova are smaller than those of the trout, and vary in colour from white to deep orange, and they hatch from the twelfth to the fourteenth day after extrusion. The fry grow to 4 or 5 inches in length by August, and by the following autumn to 9 or 10 inches.

Salmon Fishery Legislation.

In England and Wales the common law is that every person has an equal right to fish for salmon in the sea and in navigable tidal rivers, while the proprietors of the soil on the banks of rivers which are not navigable have the exclusive right of fishing in them. The erection of stake-nets, or other fixed engines for the capture of salmon in estuaries or on the sea-coast is necessarily incompatible with the maintenance of the public right of fishing, and has therefore from very early times been regarded as illegitimate. There has consequently been a constant conflict between legislation and private interest over this point. By Magna Charta all fishing weirs were abolished except on the sea-coast, but the object of this seems to have been rather the protection of the freedom of navigation than the advantage of the salmon fisheries or the maintenance of a public right. In later times fixed engines were repeatedly declared illegal and their erection prohibited by statute. Finally in 1861 they were definitively abolished in all cases except where legal right to maintain them could be conclusively proved. The Salmon Fishery Act of 1861, of which the prohibition just referred to was one of the clauses, was based upon the report of a royal commission appointed in 1860 to inquire into the condition of the salmon fisheries, and it forms the basis of the regulations at present in force, all previous legislation being by it expressly abolished and superseded. It prohibited the capture of unclean and unseasonable salmon, made a uniform close season for England and Wales, ordained a weekly close season of forty-two hours, provided for the erection of fish-passes and regulated the use of fishing weirs on non-navigable rivers, vested the central authority of the salmon fisheries in the Home Office, and provided for the appointment of inspectors. In 1863 an Act was passed prohibiting the exportation of salmon during the close time. In 1865, as it was found useless to legislate without machinery to enforce the law, an Act was passed to constitute fishery districts under the control of local boards of conservators appointed by the magistrates in quarter-sessions. These boards were empowered to enforce a licence duty on fishing implements used in public waters. One or two minor salmon fishery Acts were passed in succeeding years, but the next important piece of legislation on the subject was the Act of 1873, the two most important provisions of which are (1) that fishermen in public waters for every £50 of licence duty which they pay elect a member of the

¹ The average period between fertilization and hatching, as ascertained at Howletoun, is at 44°—*Salmo fario*, 71 days; *S. levenensis*, 72; *S. fontinalis*, 73; *S. salar*, 77.

local board of conservators, and (2) that each board of conservators may make bye-laws for the regulation and improvement of the fisheries within its own district. The annual close time for salmon in England and Wales at present for nets commences Aug. 14–Sept. 30 and closes Feb. 2–April 1, varying in different districts within the limits given; for rods the close time is Sept. 30–Nov. 29 to Feb. 1–May 1. The law as regards close time for fixed engines was amended in 1879. The method of fishing followed in the English and Welsh estuaries is in consequence of the above course of legislation that of sweep-nets worked from shore by boats; a licence duty has to be paid for each net, and stake-nets along the coast are very rare. An inspector of salmon fisheries appointed by the Home Office reports annually.

In Scotland the laws regulating salmon fisheries differ in some important particulars from those of England. There is no public right of salmon fishing,—all salmon fishings, whether in rivers, estuaries, or the narrow or territorial seas, belonging either to the crown or the grantees of the crown. Movable nets only can be used in rivers and in estuaries; but fixed nets—that is, stake-, fly-, and bag-nets—may be used outside the estuaries of rivers and on the shores of the sea. The principal Acts regulating the Scotch salmon fisheries are the Acts of 1862 and 1868, the Tweed Fisheries Acts of 1857 and 1859, and the Solway Act of 1804. But some other Acts are still in force; and, to simplify existing legislation, a consolidation Act is much needed. There is an annual close time of 168 days, except on Tweed, where it is 151, and a weekly close time of 36 hours, from 6 in the evening of Saturday until 6 on Monday morning. There is an extension of time for angling after the nets are off, varying from 6 weeks to 3 months. The construction and use of cruives, dams, mill-lades, water-wheels, and the meshes of nets are regulated; and Scotland is divided into fishery districts, about one-third of which have district boards. In 1882 a Fishery Board for Scotland was constituted, which has the general superintendence of the salmon fisheries. An inspector of salmon fisheries was likewise appointed by the home secretary, who has since visited all the salmon rivers in Scotland and reported on them to the Fishery Board.

The common law regarding the right of fishing in the sea and navigable rivers and waters in Ireland is the same as that of England. The principal statute regulating the Irish fisheries is that of 1868. There are boards of conservators, clerks, water bailiffs, and licence duties, as in England. The weekly close time is 48 hours. The annual close time for nets is not less than 168 days, but the inspectors may vary the periods at which it commences and ends. The close season for angling is from 1st November to 1st February exclusive. There are three inspectors of salmon fisheries, who make annual reports to the lord lieutenant of Ireland.

Introduction of Species to New Areas by Human Agency.

Within the past few years, since great activity has been exhibited in pisciculture generally, and especially in the culture of *Salmonidæ*, various experiments have been made in the transportation of eggs or young fry of valuable species from their native habitats to distant parts of the world. The American so-called brook trout, *S. fontinalis*, has been imported somewhat largely into Britain by various salmon fishery proprietors. It thrives well in various places in England, Scotland, and Wales where it has been set free,—for example, in Norfolk rivers, near Guildford in Surrey, and in the stock ponds at Howietoun.

In *Nature*, July 16, 1885, an account was given of the introduction of the fry of the American landlocked salmon (*S. salar*, var. *sebago*) to the upper waters of the Thames. Eggs of *S. namaycush*, *S. seabago*, *S. fontinalis*, and *Coregonus albus* have been successfully forwarded from the hatcheries of the American Fish Commission to the Deutsche Fischerei-Verein in Berlin, and to the Société d'Acclimatation at Paris.

The common trout of Britain, *S. fario*, was introduced with complete success into Tasmania nearly twenty years ago by Frank Buckland, and is now abundant in the Tasmanian streams, although it is reported to be much less valued as food there than at home. From Tasmania the eggs were transported to the rivers in Otago, New Zealand, where they also thrive and breed (see *Trans. of Otago Institute*, 1878). In 1866 Mr Francis Day introduced the fry of the same species into the rivers of the table-land of the Nilgiris in the neighbourhood of Madras. The experiment on this occasion failed, but two years later the establishment of the species in the district in question was successfully accomplished by Mr M'Ivor, who imported the fry from Scotland.

Salmon Culture.

For the artificial culture of Salmonoids the reader is referred to the article *PISCICULTURE*. The following account of the salmon and trout hatcheries in Scotland is abridged from a paper read before the Scottish Fisheries Improvement Association in Edinburgh, 26th November 1884, by J. Barker Duncan, the honorary secretary to the Association.

The principal institution of its kind in Scotland at present is the Howietoun Fishery, belonging to Sir J. Gibson Maitland, who commenced it in 1878. Howietoun is about four miles from Stirling. The establishment contains thirty-two fish ponds and a large hatching-house; there are also four ponds at Craigend, and one of 9 acres at Goldenhove, where fish are reared to their adult condition. The hatching-boxes are of wood, and the eggs are kept during development on glass grilles. The water supply is abundant, about a million gallons of spring water flowing through the ponds every twenty-four hours. The eggs hatched in greatest numbers are those of the Loch Leven trout, but *Salmo salar* and the common trout (*Salmo fario*) are also extensively reared. The American brook trout, *S. fontinalis*, is also cultivated. More than ten millions of ova are annually treated at this hatchery. In 1884 ninety thousand young fish were distributed to various parts of Great Britain and Ireland, and two consignments of trout and one of salmon ova were successfully sent to New Zealand.

The Solway Fishery, belonging to Mr Joseph J. Armistead, was established in 1881, to supersede the Trentdale Fishery near Keswick, Cumberland. It is situated near the Solway in Kirkcudbrightshire. Various kinds of trout and charr, salmon and sea-trout, grayling, and other freshwater fish are bred. The hatching-house is fitted to hatch about a million ova. Small and large quantities of ova are supplied to applicants for purposes of stocking or for experiments in fish culture.

The Stormontfield Ponds were established in 1853 by proprietors of Tay fisheries. They are situated about 5 miles above Perth on the Tay and occupy about 2 acres of ground. The Stormontfield experiments above referred to were carried out at these ponds under the direction of Mr Robert Buist. The establishment is now almost superseded by the Dupplin Hatchery, but is still used to some extent. The hatching-boxes, 360 in number, are in the open air, and the eggs are placed on gravel at the bottom of the boxes; a larger percentage of loss occurs with this system than when glass grilles are used. Two of the ponds at Stormontfield are stocked with parr from the Dupplin Hatchery, about 20,000 being placed in them in 1884; the parr are fed with ground liver, and are liberated in the river and its tributaries when two years old.

The Dupplin Hatchery was instituted in 1882 by the Tay district board at Newmill, Dupplin Castle, on the river Earn, a tributary of the Tay. The hatching-house is supplied with spring water, and contains about 300,000 ova. The glass grille system is adopted here, and the fry are liberated in the Tay and its tributaries when about forty days old.

There is a hatchery for Loch Leven trout erected in 1883 by the Loch Leven Angling Association, situated about 800 yards from the loch, beside a small stream. In the season of 1884–85 about 220,000 eggs were laid down. The fry are turned into the feeders of the loch five or six weeks after hatching. Before the erection of this hatchery Loch Leven was several times stocked with fry from the Howietoun Fishery. The great effect of stocking on the produce of Loch Leven is shown by the following figures:—in 1884 over 15,000 trout were taken in the loch during the season from April to September; during the preceding ten years the lake had been supplied with some thousands of fry in five several seasons; previous to 1874 no attempt at stocking had been made, and in that year the total catch was about 5000.

In May 1884 the Linlithgow Palace Loch Hatchery was opened by its proprietor, Mr A. G. Anderson, fish merchant, Edinburgh, who holds a lease of the loch for angling purposes from the crown. The hatchery is intended chiefly to stock the loch, and is capable of containing about 600,000 ova. Experiments on the cultivation of *Salmo salar*, var. *sebago*, from America, are also to be made here.

A private hatchery belonging to the marquis of Ailsa, capable of hatching about 250,000 ova, is situated at Culzean in Ayrshire. Salmon ova are obtained from the rivers Doon, Stinchar, and Minnock, and the fry turned again into those rivers when about six weeks old. Charr, *S. fontinalis*, and Loch Leven trout are also hatched to stock the hill lochs of the estate of Culzean. According to Mr Young the number of salmon in the Doon has been considerably increased by the artificial stocking from this establishment.

Another private hatchery, with a capacity of 50,000, is maintained on the Loch-buy estate, Isle of Mull, for the purpose of stocking the rivers and lakes on the property.

The Aberdeen Hatchery was established in Aberdeen by the district boards of the rivers Dee and Don. From 15,000 to 20,000 fry are hatched here every year and are conveyed 10 to 40 miles up the rivers Dee and Don and then liberated.

Various proprietors in Scotland have at various times erected small hatching-houses on the rivers of their estates for the purpose of stocking, but these have not been maintained. The above-mentioned are the only salmon-rearing establishments of any importance at present in operation in Scotland.

Salmon Disease.

During the last few years salmon in a great many rivers have been observed to be suffering from an epidemic cutaneous disease from which large numbers have died. So far as is known this disease in its epidemic form is quite a new phenomenon; there can be little doubt that it must have occurred as a sporadic affection in former times, but it seems on the other hand probable that such mortality among salmon as has taken place in some recent seasons must have attracted attention if it occurred, even when accurate observation was rare. The disease was first noticed in 1877 in the Esk and the Nith, flowing into the Solway Firth, and since then it has destroyed very large numbers of salmon in almost every river in Britain. The disease consists in ulcerations of the skin, which begin at one or several spots on the head and body, and ultimately extend to the whole surface of the fish. The diseased parts of the skin are found when examined to be covered with a fungoid growth, with the mycelium of a fungus consisting of plaited hyphæ which extend into and ramify through the tissue of the derma and epidermis, causing the cells to die, until the superficial tissues decay and slough off, and inflammation and bleeding are produced in the deeper and surrounding parts. It is certain that the injury to the skin and flesh of the salmon is caused by the fungus. If a section of the edge of an affected spot be made, and examined microscopically, the cells are seen to be perfectly normal and healthy beyond the region to which the hyphæ extend, and the growing points of the hyphæ are seen to be penetrating between and distorting these uninjured cells. It is evident therefore that the morbid alteration of the tissues follows the attack of the hyphæ and does not precede it. The external superficial part of the mycelium covering a diseased spot of the skin bears the fructification of the fungus. This consists of zoosporangia, which are the enlarged blind terminal parts of certain of the hyphæ,

that stand out perpendicular to the surface of the mycelium. Each zoosporangium contains a multitude of spherical spores. These spores are of the kind technically called zoospores, each on its escape from the sporangium moving about actively by means of two vibratile cilia. The zoosporangium emits the zoospores by an aperture at its end, and when it has emptied itself the hypha begins to grow again at the base of the empty membrane and sends up through the cavity of the old zoosporangium a new sprout which becomes a second spore capsule. This feature is characteristic of the genus *Saprolegnia*, belonging to the *Oosporae*, various kinds of which are well known to botanists; they usually occur in dead insects or other invertebrate animals in water: the dead bodies of the common house-fly when in a sufficiently moist place almost invariably produce a luxuriant crop of *Saprolegnia*. The commonest species of *Saprolegnia* is *S. ferax*, and the salmon fungus has usually received the same name, as though it were a proved fact that it was identical with that species. But the species of a *Saprolegnia* can only be ascertained from the characters of its oosporangia, which are quite different from the zoosporangia and are produced much more rarely, and whose contents, the oospores, are fertilized by the contents of simultaneously produced antheridia. Mr Stirling has observed the oosporangia of salmon fungus (see his papers in *Proc. Roy. Soc. Ed.*, 1878 and 1879), but his description is not sufficient to put the identification of the species beyond a doubt. From Prof. Huxley's experiments it is evident that the salmon fungus may reproduce for very many generations without the appearance of oospores. The salmon fungus grows with great luxuriance on other animal substances. In a diseased salmon the fungus seems to be confined to the skin and not to give rise to bacteria-like bodies in the internal organs. What are the conditions which favour the infection of salmon in a river is a question to which at present no answer can be given. Until it is known under what conditions the *Saprolegnia* exists in a river before infecting the salmon, the conditions which favour or prevent salmon disease cannot be ascertained. The fungus may have its permanent nidus in decaying vegetable substances, but at present it has not been determined whether it is possible to cultivate the salmon *Saprolegnia* on vegetable matter; or the disease may be propagated sporadically among the fish, Salmonoids and others, which are permanent residents of the rivers; or its abundance may depend on the amount of dead animal matter that is available for its nutrition. There is probably always some *Saprolegnia* in every river; the secondary conditions which determine whether or not the fungus shall multiply on the anadromous salmon to such an extent as to cause an epidemic have yet to be ascertained.

Literature.—Albert Günther, *Catalogue of Fishes in Brit. Mus.*, London, 1866, vol. vi.; Id., *Introduction to Study of Fishes*, Edinburgh, 1880; Francis Day, *Fishes of Great Britain and Ireland*, London and Edinburgh, 1880 to 1884, vol. ii. The following papers of the Conferences of the International Fisheries Exhibition, London, 1883, also contain valuable information:—"Fish Culture," by Francis Day; "Salmon Fisheries," by Charles S. Folger; "Culture of Salmonidae," by Sir James Maitland; "Salmon and Salmon Fisheries," by David Milne Home. For a most complete and valuable memoir on the salmon disease see the paper by Prof. Huxley, *Quart. Jour. Mic. Sci.*, 1882. (J. T. C.)

SALOME, widow of Alexander Jannæus, and queen of Judæa from 79 to 69 B.C. (see *ISRAEL*, vol. xiii. p. 424). Another Salome is the daughter of Herodias mentioned in Matt. xiv. 6. Her father was Herod, son of Herod the Great and Mariamme, and she became successively wife of her father's brother the tetrarch Philip (son of Herod the Great by Cleopatra; see *HEROD PHILIP*), and of Aristobulus.

SALONICA, or **SALONIKI** (Ital. *Salonico*, Turkish *Selanik*, Slav. *Solum*, the ancient *Thessalonica*), during the Roman empire the capital of the province of Macedonia, and still one of the most important cities of European Turkey, the chief town of an extensive vilayet which includes the sanjaks of Salonica, Serres, Drama, and Monastir, and has an aggregate population of 1,500,000. Salonica lies on the west side of the Chalcidic peninsula, at the head of the Gulf of Salonica (*Sinus Thermaicus*), on a fine bay whose southern edge is formed by the Calamarian heights, while its northern and western side is the broad alluvial plain produced by the discharge of the Vardar and the Inje-Karasu, the principal rivers of western Macedonia. Built partly on the low ground along the edge of the bay and partly on the hill to the north (a compact mass of mica schist), the city with its white houses enclosed by white walls runs up along natural ravines to the castle of the Seven Towers (Heptapyrgion), and is rendered picturesque by numerous domes and minarets and the foliage of elms, cypresses, and mulberry trees. The hill of the

Heptapyrgion is dominated by a second and that by a third eminence towards the north. The commercial quarter of the town, lying naturally to the north-west, towards the great valleys by which the inland traffic is conveyed, is now pierced by broad and straight streets paved with lava; and the quay extends from the north-west of the city for four-fifths of a mile to the Kauli-Kule (Tower of Blood), or as it is now called Ak-Kule (White Tower). The old Via Egnatia traverses the city from what is now the Vardar Gate to the Calamarian Gate. The houses are for the most part insignificant wooden erections covered with lime or mud. Two Roman triumphal arches used to span the Via Egnatia. The arch near the Vardar Gate—a massive stone structure probably erected after the time of Vespasian—was destroyed about 1867 to furnish material for repairing the city walls; an imperfect inscription from it is now preserved in the British Museum.¹ The other arch, popularly called the arch of Constantine, but by Leake assigned to the reign of Theodosius, consisted of three archways built of brick and faced with marble. It is now in a very dilapidated state.² A third example of Roman architecture—the remains of a white marble portico supposed to have formed the entrance to the hippodrome—is known by the Judæo-Spanish designation of Las Incantadas, from the eight Caryatides in the upper part of the structure.³ The conspicuous mosques of Salonica have nearly all an early Christian origin; the remarkable preservation of their mural decorations makes them very important for the history of Byzantine architecture. The principal are those dedicated to St Sophia, St George, and St Demetrius.

St Sophia (Aya Sofia), formerly the cathedral, and probably erected by Justinian's architect Anthemius, was converted into a mosque in 1589. It is cased with slabs of white marble. The whole length of the interior is 110 feet. The nave, forming a Greek cross, is surmounted by a hemispherical dome, the 600 square yards of which are covered with a rich mosaic representing the Ascension. St Demetrius, which is probably older than the time of Justinian, consists of a long nave (divided into three bays by massive square piers) and two side aisles, each terminating eastward in an atrium the full height of the nave, in a style not known to occur in any other church. The columns of the aisles are half the height of those in the nave. The internal decoration is all produced by slabs of different-coloured marbles. St George's, conjecturally assigned by Messrs Pullan and Texier to the reign of Constantine, is circular in plan, measuring internally 80 feet in diameter. The external wall is 18 feet thick, and at the angles of an inscribed octagon are chapels formed in the thickness of the wall, and roofed with waggon-headed vaults visible on the exterior; the eastern chapel, however, is enlarged and developed into a bema and apse projecting beyond the circle, and the western and southern chapels constitute the two entrances of the building. The dome, 72 yards in circumference, is covered throughout its entire surface of 800 square yards with what is the largest work in ancient mosaic that has come down to us, representing a series of fourteen saints standing in the act of adoration in front of temples and colonnades. The Eski Juma, or Old Mosque, is another interesting basilica, evidently later than Constantine, with side aisles and an apse without side chapels. The church of the Holy Apostles and that of St Elias also deserve mention. Of the secular buildings, the Caravanserai, usually attributed to Amurath II., probably dates from Byzantine times.

The prosperity of Salonica has all along been largely that of a commercial city. During the Christian centuries before the Mohammedan conquest the patron saint of the city was also the saint of a great market or fair to which merchants came from all parts of the Mediterranean, and even from countries beyond the Alps. At the beginning of the present century a large export trade was carried on in woollen and cotton fabrics, white and red yarns, grain, wool, tobacco, yellow berries, silk fabrics, sponges, &c.; and silk gauze was manufactured in the city. Direct British trade with Salonica began after the Greek war of independence. Woven fabrics are at present imported from England, Austria, Germany, Switzerland, and Italy; sugar mainly from Austria; coffee from South America (partly direct); petroleum from America and Russia; soap from Greece and Crete; metal goods from England, France, and Austria; and coal from England. The exports com-

prise cereals (wheat, barley, oats, maize, rye), tobacco, wool, cotton, poppy seed, opium, cocoons, prunes, and timber. In 1884 the industrial establishments were steam flour-mills, a cotton-spinning factory (employing 500 hands and sending its goods to Constantinople, Smyrna, and Beyrout), a distillery, several large soap-works, a nail factory, an iron-bedstead factory, and a number of brick and tile works.

In Salonica the several nationalities have schools of their own: the Greeks, for example, have a normal school, a gymnasium, and nine other schools (one for girls); and even the Bulgarians, though their members are comparatively small, have two normal schools. The Jewish community (about 50,000) is of Spanish origin, and still preserves its Judæo-Spanish written in Hebrew characters. Besides their own schools they have the advantage of a large school supported by the Jewish Mission of the Established Church of Scotland (instituted about 1860). The total population of Salonica was estimated by Tozer about 1865 as 60,000. It has since increased probably to 90,000 or 100,000. The railway opened to Kiuprili (136½ miles) in 1873 is now extended 75 miles to Mitrovitza.

History.—The older name of Thessalonica was Therna (in allusion to the hot-springs of the neighbourhood). It was a military and commercial station on a main line of communication between Rome and the East, and had reached its zenith before the seat of empire was transferred to Constantinople. It became a Roman *colonia* in the middle of the 3d century, and in the later defence of the ancient civilization against the barbarian invasions it played a considerable part. In 390 Thessalonica was the scene of the dreadful massacre perpetrated by command of Theodosius. Constantine repaired the port, and probably enriched the town with some of its buildings. During the iconoclastic reigns of terror it stood on the defensive, and succeeded in saving the artistic treasures of its churches: in the 9th century Joseph, one of its bishops, died in chains for his defence of image-worship. In the 7th century the Slavonic tribes strove to capture the city, but in vain even when it was thrown into confusion by a terrible earthquake which lasted several days. It was the attempt made to transfer the whole Bulgarian trade to Thessalonica that in the close of the 9th century caused the invasion of the empire by Simeon of Bulgaria. In 904 the Saracens from the Cyrenaica took the place by storm; the public buildings were grievously injured, and the inhabitants to the number of 22,000 were carried off and sold as slaves throughout the countries of the Mediterranean. In 1185 the Normans of Sicily, having landed at Dyrrhachium and marched across country, took Thessalonica after a ten days' siege, and perpetrated endless barbarities, of which Eustathius, then bishop of the see, has left us an account. In 1204 Baldwin, conqueror of Constantinople, conferred the kingdom of Thessalonica on Boniface, marquis of Montferrat; but eighteen years later Theodore, despot of Epirus, one of the natural enemies of the new kingdom, took the city and had himself there crowned by the patriarch of Macedonian Bulgaria. On the death of Demetrius (who had been supported in his endeavour to recover his father's throne by Pope Honorius III.) the empty title of king of Salonica was adopted by several claimants. In 1266 the house of Burgundy received a grant of the titular kingdom from Baldwin II. when he was titular emperor, and it was sold by Eudes IV. to Philip of Tarentum, titular emperor of Romania in 1320. The Venetians, to whom the city was transferred by one of the Palæologi, were in power when Sultan Amurath appeared, and on the 1st of May 1430, in spite of the desperate resistance of the inhabitants, took the city, which had thrice previously been in the hands of the Turks. The body of St Demetrius, the patron saint, who from the time of his death under Maximian in the 4th century had exercised a marvellous influence on the popular imagination, was hacked to pieces, though even the Mohammedans attributed virtue to the famous oil from which the saint obtained the title of Myroblete. In 1876 the French and German consuls at Thessalonica were massacred by the Turkish populace.

I. G.*, vol. ii.; Texier and Pullan, *Byzantine Architecture* (1864); Tozer, *Highlands of Turkey*, 1869.

SALOP. See SHROPSHIRE.

SALSETTE, a large island to the north of Bombay, with an area of 241 square miles. It lies between 19° 2' 30" and 19° 18' 30" N. lat. and between 72° 51' 30" and 73° 3' E. long.; it is connected with Bombay Island by bridge and causeway. Salsette is a beautiful, picturesque, and well-wooded tract, its surface being well diversified by hills and mountains, some of considerable elevation, while it is rich in rice fields. In various parts of the island are romantic views, embellished by the ruins of Portuguese churches, convents, and villas; its cave antiquities still form a subject of interest.

At the census of 1881 Salsette had a population of 108,149 (males 58,540, females 49,609); Hindus numbered 74,736 and Mohammedans 7,036. The island was taken from the Portuguese by the Mahrattas in 1739, and from them the British captured it in 1774; it was formally annexed to the East India Company's dominions in 1782 by the treaty of Salbai.

SALT. Common salt, or simply salt, is the name given to the native and industrial forms of sodium chloride (NaCl). The consideration of this important substance naturally falls under two heads, relating respectively to sea salt or "bay" salt and "rock" salt or mineral salt. As actually found, however, the one is probably derived from the other, most rock salt deposits bearing evidence of having been formed by the evaporation of lakes or seas at former (often remote) geological periods. This is seen from their stratified nature, with their interposed beds of clay, which could only have been deposited from solution. The crystals of selenite (hydrated calcium sulphate), moreover, which they contain can only have been formed in water and can never since have been subjected to any considerable amount of heat, otherwise their water of crystallization would have been driven off. The beds also of potassium and magnesium salts found at Stassfurt and other places, interposed between or overlying the rock salt deposits, are in just the position in which one would naturally expect to find them if deposited from salt water. Finally, the marine shells often occurring abundantly in the surrounding rocks of contemporary periods also testify to the former existence of large neighbouring masses of salt water.

Sea Salt.—Assuming a degree of concentration such that each gallon of sea water contains 0.2547 lb. of salt, and allowing an average density of 2.24 for rock salt, it has been computed that the entire ocean if dried up would yield no less than 4,419,360 cubic miles of rock salt, or about fourteen and a half times the bulk of the entire continent of Europe above high-water mark, mountain masses and all. The proportion of sodium chloride in the water of the ocean, where it is mixed with small quantities of other salts, is on the average about 33.3 per 1000 parts, ranging from 29 per 1000 for the polar seas to 35.5 per 1000 or more at the equator. Enclosed seas, such as the Mediterranean, the Red Sea, the Black Sea, the Dead Sea, the Caspian, and others, are dependent of course for the proportion and quality of their saline matter on local circumstances. Forchhammer found the following quantities of solid matter in the water of various seas:—

North Sea.....	32.80 grammes per litre.
Cattegat and Sound.....	15.12 "
Baltic.....	4.81 "
Mediterranean.....	37.50 "
Atlantic.....	34.80 "
Black Sea.....	15.89 "
Caribbean Sea.....	36.10 "

Of this sodium chloride constitutes about four-fifths. See SEA WATER.

At one time almost the whole of the salt in commerce was produced from the evaporation of sea water, and indeed salt so made still forms a staple commodity in many countries possessing a seaboard, especially those where the climate is dry and the summer of long duration. In Portugal a total of over 250,000 tons is annually made in the salt works of St Ubes (Setubal), Alcaccer do Sal, Oporto, Aneyro, and Figueras. Spain, with the salt works of the Bay of Cadiz, the Balearic Islands, &c., makes 300,000 tons. Italy has salt works in Sicily, Naples, Tuscany, and Sardinia, producing 165,000 tons. In France, between the "marais salants du midi" and those on the Atlantic, 250,000 to 300,000 tons are annually produced, besides those of Corsica. The "Salzgärten" of Austria produce collectively from 70,000 to 100,000 tons annually at various places on the Adriatic (Sabioncello, Trieste, Pirano, Capo d'Istria, &c.). In England and Scotland the industry has of late

years greatly fallen off under the competition of the rock-salt works of Cheshire, but some small manufactories still exist, at North Shields and elsewhere, where salt is made by dissolving rock-salt in sea water, and evaporating the solution to crystallization by artificial heat.

The process of the spontaneous evaporation of sea water has been very carefully studied by Usiglio on Mediterranean water at Certe. The density at first was 1.02. Primarily but a slight deposit is formed (none until the concentration arrives at specific gravity 1.0509), this deposit consisting for the most part of calcic carbonate and ferric oxide. This goes on till a density of 1.1315 is attained, when hydrated calcium sulphate begins to deposit, and continues till specific gravity 1.2646 is reached. At a density of 1.218 the volume of the sea water has become reduced to $\frac{3}{4}$ ths of what it was at first, and from this moment the deposit becomes augmented by sodium chloride, which goes down mixed with a little magnesium chloride and sulphate. At specific gravity 1.2461 a little sodium bromide has begun also to deposit. At specific gravity 1.311 the volume of the water is only $\frac{1}{4}$ ths of what it was at first, and it is thus composed:—

Magnesium sulphate	11.45 per cent.
Magnesium chloride.....	19.53 "
Sodium chloride.....	15.98 "
Sodium bromide.....	2.04 "
Potassium chloride.....	3.30 "

Up to the time then that the water became concentrated to specific gravity 1.218 only 0.150 of deposit had formed, and that chiefly composed of lime and iron, but between specific gravity 1.218 and 1.313 there is deposited a mixture of—

Calcium sulphate.....	0.0283 per cent.
Magnesium sulphate.....	0.0624 "
Magnesium chloride.....	0.0153 "
Sodium chloride.....	2.7107 "
Sodium bromide.....	0.0222 "

2.8389 "

And of this we see that about 95 per cent. is sodium chloride. Up to this point the separation of the salts has taken place in a fairly regular manner, but now the temperature begins to exert an influence, and some of the salts deposited in the cold of the night dissolve again partially in the heat of the day. By night the liquor gives nearly pure magnesium sulphate; in the day the same sulphate mixed with sodium and potassium chlorides is deposited. The mother-liquor now falls a little in density to a specific gravity of 1.3082 to 1.2965, and yields a very mixed deposit of magnesium bromide and chloride, potassium chloride, and magnesium sulphate, with the double magnesium and potassium sulphate, corresponding to the kainite of Stassfurt. There is also deposited a double magnesium and potassium chloride, similar to the carnallite of Stassfurt, and finally the mother-liquor, which has now again risen to specific gravity 1.3374, contains only pure magnesium chloride.

The application of these results to the production of salt from sea water is obvious. A large piece of land, varying from one or two to several acres, barely above high-water mark, is levelled, and if necessary puddled with clay so as to prevent the water from percolating and sinking away. In tidal seas a "jas" (as the storage reservoir is called) is constructed alongside, similarly rendered impervious, in which the water is stored and allowed to settle and concentrate to a certain extent. In non-tidal seas this storage basin is not required. The prepared land is partitioned off into large basins (*adernes* or *muants*) and others (called in France *aires*, *œuillots*, or *tables salantes*) which get smaller and more shallow in proportion as they are intended to receive the water as it becomes more and more concentrated, just sufficient fall being allowed from one set of basins to the other to cause the water to flow slowly through them. The flow is often assisted by pumping. The sea salt thus made is collected into small heaps on the paths around the basins or the floors of the basins themselves, and here it undergoes a first partial purification, the more deliquescent salts (especially the magnesium chloride) being allowed to drain away. From these heaps it is collected into larger ones, where it drains further, and becomes more purified. Here it is protected by thatch till required for sale.

The salt is collected from the surface by means of a sort of wooden scoop or scraper which the workman pushes before him, but in spite of every precaution some of the soil on which it is produced is inevitably taken up with it, communicating a red or grey tint. Sea salt is thence known in many of the French markets as *sel gris*, and frequently contains as much as 15 per cent. of impurity. Yet such is the ignorance and prejudice of many people that they will buy it in preference to the purer article from the evaporation of rock-salt brine, asserting its action to be milder and more even. Even if this were true they forget that mud ought to be cheaper than salt. The salt made on the coast of Brittany possesses the following composition:—

Sodium chloride.....	87.97 per cent.
Magnesium chloride.....	1.58 "
Magnesium sulphate	0.50 "
Calcium sulphate	1.65 "
Insoluble	0.80 "
Water.....	7.50 "

Generally speaking this salt goes into commerce just as it is, but in some cases it is taken first to the refinery, where it either is simply washed and then stove-dried before being sent out or is dissolved in fresh water and then boiled down and crystallized like white salt from rock-salt brine. The salt of the "salines du midi" of the south-east of France is far purer than the above, however, its composition being as follows:—

Sodium chloride.....	95.11 per cent.
Magnesium chloride.....	0.23 "
Magnesium sulphate	1.30 "
Calcium sulphate	0.91 "
Insoluble.....	0.10 "
Water.....	2.35 "

This is perhaps partly owing to the fact that of late years, by way of obviating the above-mentioned cause of impurity, a species of moss has been introduced there with some success from Portugal and forms a bed on which the salt is deposited. The mother-liquors from the crystallization of the common salt contain still a little sodium chloride and most of the bromine and iodine of the sea water, all the potassium salts, much magnesium sulphate, and a large quantity of magnesium chloride. They are often thrown away as useless, but lately, in the south of France, in the "salines du midi," they have been used for the production of certain chemicals by a system of ulterior treatment introduced by M. Merle and still continued by his successor M. Pechinet.

As soon as the water arrives at specific gravity 1.2407 and has deposited most of its salt, it is drawn off and stored in large tanks of 50,000 or 60,000 cubic metres capacity. From these it is withdrawn in successive portions, and artificially cooled to 0.4° Fahr. Under these circumstances, indeed at any temperature below 26° Fahr., a double decomposition takes place between the sodium chloride and the magnesium sulphate—crystallized sodium sulphate being thus separated. After being withdrawn and freed from the mother-liquor by a hydro-extractor, this sulphate, which contains two atoms of water, is then rendered anhydrous by heating in a reverberatory furnace. From the refrigerating vessel the water now passes to an ordinary evaporating pan, where the remaining salt is precipitated by boiling, collected, and purified by the hydro-extractor. Here the water attains a specific gravity 1.2680, and, being spread out in a thin layer on a smooth level bed of cement or concrete, deposits on cooling all its potassium as the double chloride of potassium and magnesium, the same as the carnallite of Stassfurt.

Fig. 1 represents the usual form of an Austrian "Salzgarten" at Capo d'Istria. It is a parallelogram of 2 to 3 acres in extent

FIG. 1.—Plan of Austrian Salzgarten.

surrounded by a dyke or sea-wall *a*. The sea water enters by the sluice *b*, and passes into the wide fosse *c*, where, clarifying by settlement, it passes by the openings *f* into a sextuple series of large basins divided by the separations *d*, first of all entering the

largest ones *g, h, i*, and then passing by the canals *n* into the other basins *k, l, i, l*. The flow of the water from one set of basins to the other is regulated by the sluices *e, e, e*. As it passes from one set of basins to another it becomes more and more concentrated, till at last in the basins *m, m* the salt deposits. The mother-liquor or

"bittern" is then run off into *p*, and thence into the sea. In France it is often stored as already stated for future treatment. In case of heavy rain, the already concentrated water is run into the covered cisterns *s, s*, which serve to hold it till the return of fine weather.

Rock-Salt.—This appears to occur in almost every formation, except in the Primary rocks, strictly so called. The oldest deposit of which the age may be considered to have been anything like precisely determined may be said to be the great salt range of the Punjab, which is regarded as belonging to the Permian; and that lately discovered at Middlesbrough in Yorkshire, immediately overlying the magnesian limestone, may be probably referred to the same period. In the northern counties of England there are frequent instances of brine springs rising from the Carboniferous and contiguous formations. The Cheshire and Worcestershire salt-beds are by some attributed to the Permian; more generally, however, they are referred to the Trias. Those of West New York and Gooderich (Canada) are said to belong to the Salina period of the Upper Silurian. The deposits of the Vosges, Salzburg, and others of central Germany and Austria are considered to belong to the Trias; that of Bex in Switzerland to the Lias. Those of Wieliczka in Poland, Cardona in Spain, and some Algerian formations are admitted to be Cretaceous. Those of Bayonne, Dax, and Camarade, in the Pyrenees, are probably Tertiary, while the Dead Sea, Lake Elton in Astrakhan, the Bitter Lakes of the Isthmus of Suez, the Kara Boghaz on the shores of the Caspian, the Limans of Bessarabia south of Odessa, the Runn of Cutch, and certain formations of the Sea of Azoff, &c., are instances of salt formations now in actual progress. The frequent association of bitumen and petroleum with rock-salt and brine is one of the most noticeable features in the geology of those substances, and seems to point to some unknown condition of the formation of the two first named. The Dax salt is close to the bitumen deposits of Bastenès and Gaujac. Borings made at Dax, as well as at Salies about 20 miles distant (where also salt exists), gave vent to an efflux of inflammable gas which continued for several weeks, and the water of several springs in that neighbourhood is tainted with petroleum. Bitumen and petroleum occur near Volterra in Tuscany, where a large deposit of salt is being worked. In Walachia the two occur in the same formation. In the United States of America and in the south of Russia petroleum and brine are found in many places either actually associated or in near proximity; petroleum has recently been discovered not far from the salt deposits of Hanover, and one of the beds of rock-salt at Nancy is strongly coloured by bitumen, while almost all rock-salt has a more or less perceptible bituminous odour when struck or rubbed. In the province of Szechuen, China, are some remarkable salt springs, where the brine is accompanied by such an efflux of inflammable gas that the latter serves as fuel for its evaporation; and other springs accompanied by the same phenomenon exist

in the same region. In fact, instances without end might be cited of the two occurring together, and it would appear that petroleum for some mysterious reason can only be formed in presence of salt.

The chief rock-salt districts of Europe may be classified as follows:—(1) the Carpathians; (2) Austrian and Bavarian Alps; (3) West Germany; (4) Vosges; (5) Jura; (6) Swiss Alps; (7) Pyrenees and the Spanish or Celtiberian Mountains; (8) the British salt deposits; (9) isolated deposits and springs in Russia, Turkey, Italy, &c.

The Carpathian district may be subdivided into the Moldo-Walachian, Transylvanian, Galician, and Hungarian sections. They form probably the richest and most extensive of the European salt fields and by them alone the entire continent might be supplied for ages. The Transylvanian and Walachian mines are specially numerous and rich. Thousands of tons of salt, in the form of brine from the springs which are common throughout the country, are allowed to run to waste, no important factory existing in the country for its evaporation. The rock is in fact in itself so pure that simply ground it meets all requirements of public consumption. In Galicia the principal mines and those of most historical interest are at Wieliczka and Bochnia. The former, which is justly the most celebrated in the world, is situated 9 miles from Cracow and has been worked continuously for six hundred years. The mass of salt is calculated to be 500 miles long, 20 miles broad, and 1200 feet thick. It is on the north-west side of a ridge of hills, an offset of the Carpathians. The salt is stoped out in longitudinal and transverse galleries, and large vaulted chambers, supported by massive pillars. Explosives are not used in this or any of the other mines of the district. The salt is sold just as it comes from the mine, or else finely ground and packed in casks or sacks. The mine is divided into four levels, and is 284 yards deep and 1 mile 1279 yards long by 830 yards wide. All the grinding and packing is done within it. It is stated that the collective length of the galleries and chambers is no less than 30 English miles and the total yield 55,067 tons per annum. These mines employ from eight hundred to one thousand persons, many of whom live permanently under ground; the lower levels contain streets and houses and constitute a complete village. Travellers have given glowing descriptions of the crystal vaults, sparkling aisles, and fairy palaces of this mine. The salt is greyish, and somewhat resembles granite in appearance.

In the well-known district of the Austrian and Bavarian Alps the mine of Salzburg (Salzkammergut) is perhaps the most familiar. The Austrian portion of the district includes the towns of Aussee, Ischl, Hallstadt, and Hallein, and the Bavarian includes Berchtesgaden, Reichenhall, Traunstein, and Rosenheim. In the last-named salt is made from brine conveyed in pipes from Berchtesgaden, passing by Reichenhall, 15 miles in all, with a total fall of 1552 feet. There are also large salt works at Hall near Innsbruck. Here, as in the Carpathian region, most of the rock-salt is sold merely ground, or in lumps, and the trade is, as in other parts of Austria-Hungary, a strict Government monopoly, producing an annual revenue of two and a quarter to two and a half millions sterling.

The German mines are numerous; they extend north and south from Segeberg in Holstein to Sulz on the Neckar, and east and west from Kreuznach to Halle. Brine springs and small workings lie scattered all over the country. But two formations of special importance are Stassfurt in Saxony and the Lüneburg Heath in

Hanover. Fig. 2 represents a section of the Stassfurt beds, and will give an idea of their formation. It appears less than most others to have been subjected to denudation since being formed, and consequently better than many others illustrates the formation of such deposits. Overlying the salt properly so called (e) is a thin band of anhydrite, and above this b, c, d, beds of variously coloured clay, red and grey, containing highly deliquescent salts, forming three distinct layers. The lowest, d, called "polyhalite," contains some sodium chlorides and with it other deliquescent chlorides. Next to this comes c, the "kieserite" region, about 30½ yards thick—here are chiefly potassium and magnesium sulphates; and lastly we have b, the upper layer or "carnallite" region, 23 yards thick, containing almost exclusively the double potassium and magnesium chlorides, together with other deliquescent salts, nodules of boracite, &c. It has been computed that a sea depth of 12½ miles would be required for the production of such a series as this.

FIG. 2.—Section of Stassfurt Salt-Beds.

The Vosges, which is a very important district, supplied a large part of the east of France with salt, till lost by the war of 1870-1871, since which time Nancy has gained considerably in importance. Geologically speaking, Nancy is included in this basin. In Switzerland the chief salt district lies on the right bank of the Rhone, near the Lake of Geneva. The principal centres are Aigle, Roche, and Bex, the last being the most important.

The Pyrenees are rich on both sides in brine springs and rock-salt formations. In the south-west of France we have the rock-salt of Dax and Villefranche, and the brine springs of Salies and Briscous, as well as that of Camarade. In Spain both rock-salt and brine are plentiful, as is indicated by the frequent recurrence of the syllable "Sal" in the names of towns (Salinas, Salinillas, Poza de la Sal, &c.).

The Celtiberian or exclusively Spanish district includes various towns scattered over Spain—Salinas de Saelices (Guadalajara), Villafafila (Zamora), Torreximeno, Cazorla, and Hinojares (Jaen), &c.; but perhaps the most remarkable deposit of salt in Spain is that of Cardona in the province of Barcelona, 45 miles north-west of that city. Here is a veritable mountain composed of a bed of remarkably pure salt 142 to 164 yards thick, and forming two masses, each about a mile in circumference. The salt is as usual stratified, and bears very strong evidence of denudation. It is chiefly pure white, but in parts varies from light-blue to brick-red. It is extracted by an open-air working like stone from a quarry.

There are some brine and rock-salt deposits which can hardly be classified as belonging to any particular district. Such are—in France, at the foot of the Alps, the brine springs of Moutiers and Castellane; in Italy, Volterra; in Sicily, Nicosia and Mussomeli; in Croatia, Szabor; in Bosnia, Tusia; in Russia, Bachmutz on the Donetz, Balachna on the Volga, Staraya-Russa near Lake Ilmen, Eupatoria and other places in the Crimea; in Prussia, Walters-dorff, Spereberg, &c.

The chief centres of manufacture in England are at Northwich, Middlewich, Winsford, and Sandbach in Cheshire, Weston-on-Trent in Staffordshire, Stoke Prior and Droitwich in Worcestershire, and Middlesbrough in Yorkshire.¹ Duncrue near Carrickfergus in Ireland also possesses a large deposit of salt. The Cheshire and Worcestershire salt deposits are up to the present time by far the most important, the Duncrue deposit being only partially worked. Although brine springs have been known to exist in both these counties ever since the Roman occupation, and salt had been made there from time immemorial, it was not till 1670 that rock-salt about 30 yards thick was discovered at Marbury near Northwich by some men exploring for coal, at a depth of 84 yards. In 1779 three beds of rock-salt were discovered at Lawton, separated from one another by layers of indurated clay. The Marston mine, the property of Messrs Rigby and Fletcher of Northwich, is the largest and perhaps the oldest (there are twenty-five in England altogether where rock-salt is raised). It was worked for about a hundred years in only its upper bed, but in 1781 its owners decided on sinking farther, and, after traversing a layer of indurated clay intersected with small veins of salt 10½ yards thick, they came on another of

rock-salt. This—the bed which has continued to be worked ever since—is 33 to 37 yards thick. Beneath it are others, but they are thin and impure. The total depth of the mine to the bottom of the lower level is 120 yards. At Winsford, where the same formation seems to recur, it is 159 yards from the surface. The Marston mine covers an area of about 40 acres. The salt is first reached at 35-40 yards in the Northwich district, and the upper layer is 25-50 yards in thickness (Marston 23-26 yards); it has above it, apparently lying in the recesses of its surface, a layer of saturated brine. This is the brine which is raised at the various pumping stations in Northwich and elsewhere around, and which serves when evaporated to produce white salt. The beds are reached by sinking through the clays and variegated marls typical of this formation. The salt is blasted out with gunpowder. The Middlesbrough deposit bids fair soon to become of very great importance. It was discovered by Messrs Bolckow and Vaughan in boring for water in 1862 at a depth of 400 yards, but was not utilized, and was again found by Messrs Bell Bros. at Port Clarence at a depth of 376 yards, and is being now worked by them, the heat used for evaporation being the waste gases of their blast furnaces. Encouraged by their success the Newcastle Chemical Company have also bored on the opposite side of the river. They failed at first to find the salt, but ultimately succeeded by a fresh boring. The extent of the bed is not yet ascertained, but evidently by the failure of the Newcastle Chemical Company at first it cannot extend far to the north. Its thickness has been proved in so far as the spot where Messrs Bell Bros. made their boring is concerned. These gentlemen have introduced the method employed at Nancy of raising the salt in the form of brine without the trouble or expense of sinking a shaft. In Cheshire the surface-water trickling through the overlying strata dissolves the salt, which is subsequently pumped as brine, but here the great depth and impermeability of the strata precludes this, so another method has been resorted to. A bore is made into the salt, and lined with tubing in the usual manner, and this tube where it traverses the salt is pierced with holes. Within this is hung loosely a second tube of much smaller dimensions so as to leave an annular space between the two. Through this space the fresh surface water finds its way, and dissolving the salt below rises in the inner tube as brine, but only to such a level that the two columns bear to one another the relation of ten to twelve, this being the inverse ratio of the respective weights of saturated brine and fresh water. For the remaining distance the brine is raised by a pump. At first, while the cavity remains small, there is some difficulty in getting a continuous supply of brine of full strength, but this ceases to be the case as the solution chamber (as it is called) becomes enlarged. The fresh water, however, as it descends rises to the surface of the salt, tending rather to dissolve its upper layers and extend superficially, so that after a time the superincumbent soil, being without support, falls in. These interior landslips, besides choking the pipes and breaking the communication, often produce sinkings at the surface, such as occurred some time ago at Dieuze (Lorraine). The same inconvenience is beginning to make itself felt in the environs of Nancy, and a similar one produces on a larger scale the sinking and subsidences at Winsford and Northwich so much complained of. The deposits of salt in the United States are unimportant. The country possesses no really considerable salt industry, but is supplied so far as interior consumption is concerned to a small extent by brine springs. The principal supplies, however, are derived from England and the shores of Spain and Portugal. The same remark applies to Canada. South America possesses several salt deposits and brine springs, but also takes all its supplies from Europe. Asiatic Russia is very abundantly supplied with salt, as likewise is China; and Persia is perhaps one of the countries most abundantly endowed with this natural and useful product. British India cannot be said to be similarly favoured. In the north, it is true, is the great salt range of the Punjab, as well as the Sambhur Lake, and salt is obtained from sea-water at many places along its extensive seaboard; but India is not well supplied in many parts, and is dependent largely for this article on the Cheshire salt works. In fact this export is one of the most important branches of their trade.

Table II. (see next page) is from Spon's *Encyclopædia of the Industrial Arts*, &c. The clay and insoluble matters given for the Stassfurt salt seem to be somewhat abnormally large.

Rock-salt is probably the origin of more than half the salt manufactured in the world. It occurs in all degrees of purity, from that of mere salty clay to that of the most transparent crystals. In the former case it is often difficult to obtain the brine at a density even approaching saturation, and, as at Moutiers in Savoy and in several of the German salt works, chambers and galleries are excavated within the saliferous bed to increase the dissolving surface, and water let down fresh is pumped up as brine. Many brine springs also occur in a more or less saturated condition. In such cases the water is sometimes caused to trickle over faggots arranged under large open sheds called "gradirhäuser" (*Gradirhäuser*), whereby a more extensive surface of evaporation is obtained, and

¹ The termination "wich" in English place-names often points to ancient salt manufacture, the word "wich" (creek, bay; Icel. *vaf*) having acquired a special sense in English usage. In Germany the various forms of the non-Teutonic words Hall, Halle occurring in place-names point in the same way to ancient salt-works.

TABLE II.—Percentage Composition of Rock-Salt from Well-known Localities.

Country.....	Germany.								France.	Austria.		England.	
Locality.....	Schwäbisch-Hall, Württemberg.		Berchtesgaden, Bavaria.	Stassfurt, near Magdeburg.	Château Salins, Lorraine.	Vic, Lorraine.			Dax.	Hall.	Wieliczka, Galicia.	White Salt from Rock Salt, Cheshire.	Mauston Mine, North-wich.
Authority.....	Fehling.		Bischof.	Rammelsberg.	Mathieu de Dombasle.	Berthier.		Cordier.	Maxwell-Lyte.	Bischof.	Bischof.	Richardson and Watts.	Crace Calvert.
